SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
MAR 31 1970
UNIVERSITY OF ILLINOIS

VOLUME 3, NUMBER 1
JANUARY 1, 1970

W70-00001 -- W70-00417

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 1
JANUARY 1, 1970

W70-00001 -- W70-00417

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1A. Properties

THE STRUCTURE AND PROPERTIES OF WATER,
D. Eisenberg, and W. Kauzmann.
New York, Oxford Univ Press, 1969. 296 p, 70 fig, 44 tab, 403 ref.

Descriptors: *Water structure, *Water properties, *Thermodynamics, Physical properties, Water vapor, Hydrogen bonding, Molecular structure, Electrical properties, Electrical studies, Spectroscopy, Optical properties, Nuclear magnetic resonance, X-ray diffraction, Infrared radiation, Analytical techniques, Reviews, Bibliographies.
Identifiers: *Water physical properties.

Some of the most important data on the nature and properties of water are summarized and the theories that are most effective in correlating these data are presented in a textbook intended for the scientist familiar with basic physical chemistry. The relationship of water structure to water properties is explained. Infrared and Raman spectra are covered in detail because they reveal so much about ice and liquid water structures. Other techniques of study including thermodynamics, spectroscopy, electrical studies, NMR, optics, X-ray diffraction, and vibrational spectroscopy are discussed and their findings are related to structural properties. Liquid water and water vapor models are presented. An extensive bibliography consists largely of recent works but also includes many older papers. (Knapp-USGS)

THE FORMATION OF PYRITE FROM HYDRATED IRON OXIDE IN AQUEOUS SOLUTION AT 20 DEGREE C,
Bureau of Mineral Resources, Geology and Geophysics, Canberra (Australia). Baas-Becking Geobiological Lab.
William M. B. Roberts.
Mineral Deposita (Berlin), Vol 3, No 4, p 364-367, Dec 1968. 4 p, 1 tab, 8 ref.

Descriptors: *Pyrite, *Hydrates, *Suspension, *Iron oxides, *Aqueous solutions, Temperature, Atmospheric pressure, Hydrogen sulfide, Oxygen, Anaerobic conditions, Sediments, X-ray diffraction, Mineralogy.
Identifiers: Pyrite formation in aqueous solution.

Experiments conducted by the Baas-Becking Geobiological Research Laboratory of Australia on the formation of pyrite from hydrated iron oxides and sulfides in aqueous solutions are described. In carrying out the experiments, oxygen was rigorously excluded from the system and the pH was 5.6. During a later aging period a reaction takes place in which iron monosulfide is converted to pyrite at pH 5.85. The results confirm Berner's conclusions that pyrite will form during the sedimentary cycle in an anaerobic environment such as studies made on sediments from the Black Sea, and tidal flats of the Netherlands and off Massachusetts had indicated. 02. WATER CYCLE

2A. General

ANALYSIS OF TWO MAJOR RUNOFF-PRODUCING SOUTHWEST THUNDERSTORMS,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
H. B. Osborn, and K. G. Renard.
J Hydrol, Vol 8, No 3, p 282-302, Jul 1969. 21 p, 20 fig, 1 tab, 5 ref.

Descriptors: *Rainfall-runoff relationships, *Thunderstorms, *Storm structure, Arizona, Isohyets, Hyetographs, Hydrographs, Storm runoff, Runoff forecasting, Meteorlogy, Demonstration watersheds, Small watersheds.
Identifiers: Walnut Gulch Experimental Watershed.

The two largest runoff-producing storms for 10 yr of records, the first in 1964 and the second in 1967, recorded on the Walnut Gulch Experimental Watershed in southeastern Arizona are analyzed and compared. Both storms were non-frontal thunderstorms which produced peak discharges on the order of 1500 cfs per sq mi; in 1964 from a 2000-acre subwatershed, and in 1967 from an 84-acre subwatershed. During the 1967 storm rainfall of 3.35 inches in 45 min was recorded at one point on the watershed. Approximately 18 acre-ft of runoff was produced on the 84-acre subwatershed in the 1967 storm. Runoff-producing rainfall lasted for less than 60 min for both storms. For both storms, runoff per unit area decreased with increasing subwatershed size because of the large transmission losses in the ephemeral channels and because of the limited areal extent of the runoff-producing rainfall. (Knapp-USGS)

A WATERSHED FLOW MODEL OF STOCHASTIC STRUCTURE,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
Harsha Desai, and David L. Raphael.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, p 59-73, 1967. 15 p, 5 fig, 4 tab, 5 ref.

Descriptors: *Streamflow forecasting, *Routing, *Statistical models, *Hydrographs, *Synthetic hydrology, *Markov processes, Stochastic processes, Rainfall-runoff relationships, Computer models.
Identifiers: Watershed models.

A model was developed to predict the surface flow resulting from precipitation during a given time period, using simpler computations than was possible with conventional methods. It was assumed that surface flow due to rainfall would approach that of an absorbing Markov chain process. The various transfer coefficients or probabilities can be estimated and a starting state can be specified. These transfer coefficients may not remain constant for the entire time interval in a hydrologic cycle under study, due to the varying soil moisture conditions, varying precipitations, and varying climate. To make some provision for this, the transfer coefficients were estimated as an average for the total time period. Except for the initial time period of 2 days, the estimated flows were very close to the actual flows. In its application to the Susquehanna River Basin, the model used only 1 absorbing state due to the lack of sufficient data. The model was also able to give the total response behavior of the system as a whole. It was possible to estimate the amounts lost to the 3 absorbing states from the system during the total time period. (Knapp-USGS)

MATHEMATICAL SIMULATION OF A STREAM-AQUIFER SYSTEM,
Colorado State Univ., Fort Collins.
Robert A. Longenbaugh.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 74-83, 1967. 10 p, 7 fig, 8 ref.

Descriptors: *Conjunctive use, *Optimization, *Simulation analysis, *Model studies, *Computer models, Computer programs, Surface-groundwater relationships, Water levels, Water level fluctuations, Water utilization.
Identifiers: Watershed models, Arkansas River Valley (Colo).

A generalized digital computer program has been developed to simulate the conjunctive use of surface and groundwater in a stream-aquifer system. The model was adapted to the 25-mile reach of the Arkansas River Valley between La Junta and Las Animas, Colorado. Water table fluctuations in the aquifer and water exchange between the river and aquifer were studied with time. Variables considered include water applied within the area as irrigation; recharge due to precipitation; withdrawals from the aquifer by pumps and phreatophytes; and the geologic parameters of permeability, storage coefficient, bedrock elevation, and initial amount of water in storage. A comprehensive hydrologic evaluation of the study reach by the U. S. Geological Survey provided data used in verification of the model. Only a 12 month period from Oct 1, 1963, to Oct 1, 1964, was simulated, but experience with the model indicated satisfactory verification was obtained. The modeling of groundwater systems with digital computers provides flexibility, rapid analyses and an economical approach. Use of digital computer models in making administrative decisions and for optimization of the water resources is expected. (Knapp-USGS).

W70-00055

THE USE OF THE SHALLOW WATER EQUATIONS IN RUNOFF COMPUTATION,
Cornell Univ., Ithaca, N.Y. Dept. of Water Resources Engineering; and Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
James A. Liggett, and David A. Woolhiser.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 117-126, 1967. 10 p, 4 fig, 6 ref.

Descriptors: *Mathematical studies, *Rainfall-runoff relationships, *Runoff forecasting, *Unit hydrographs, *Routing, Hydrograph analysis, Synthetic hydrology, Overland flow, Channel flow, Streamflow forecasting.
Identifiers: *Watershed models, Kinematic wave theory.

The runoff process is extremely complex and cannot be described mathematically now or in the foreseeable future. The shallow water equations provide the closest description available, but the solution to these nonlinear equations appears to be too complex to gain general popularity, at least as far as the small drainage area is concerned. (The river problem seems to be easier to describe by data input to standard programs.) However, solutions to the shallow water equations provide insight into the physical process and aid in evaluating less complex models. The shallow water equations have indicated the important parameters in the overland flow problem. They indicate the degree of approximation in the easier kinematic wave solution. In a like manner they can indicate the strengths and weaknesses of any other method. Many aspects of the runoff process are stochastic. For example the exact stream or rivulet pattern can probably never be described deterministically. Also because the

input to a hydrologic system (rainfall) is stochastic, the output (streamflow) can only be described in terms of its probability laws. However, it is reasonable to separate and study those parts of the process that are deterministic for these are the components subject to control by engineering works or agricultural practices. (Knapp-USGS)
W70-00056

WATERSHED HYDRAULICS IN THE LABORATORY,
Missouri Univ., Rolla. Dept. of Civil Engineering.
Terence E. Harbaugh.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 500-513, 1967. 14 p, 5 fig, 19 ref.

Descriptors: *Model studies, *Hydraulic models, *Rainfall-runoff relationships, Routing, Time of concentration, Overland flow, Unit hydrographs, Time lag, Rainfall intensity.
Identifiers: Watershed models.

Laboratory facilities are basic ingredients in the understanding of the hydromechanic behavior of natural watersheds. The significant variables which influence time of concentration, time to equilibrium, time to peak, lag time, etc., are readily observable, thus providing an insight into the hydromechanic behavior of watersheds. This paper is devoted to a discussion of the characteristics of the time distribution of runoff (hydrography) with comments on lag time, time to peak, and other characteristics time responses of watersheds. Various definitions concerning the concept of time of concentration exist in hydrologic literature. Its general definition as the time it takes a drop of water to travel from the uppermost part of the watershed to the outlet is shown to be in direct contradiction to its definition as the time it takes a watershed to attain maximum discharge when subjected to a constant intensity rainfall. (Knapp-USGS)
W70-00065

PREDICTION OF SOIL AND WATER LOSSES,
Agricultural Research Service, Tifton, Ga. Soil and Water Conservation Research Div.; and Agricultural Research Service, Athens, Ga. Soil and Water Conservation Research Div.
Adrian W. Thomas, and John R. Carreker.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 514-523, 1967. 10 p, 1 fig, 10 tab, 12 ref.

Descriptors: *Water loss, *Soil erosion, *Consumptive use, *Evapotranspiration, Hydrologic budget, Water balance, Statistical methods, Regression analysis, Weather, Climates, Erosion, Rainfall-runoff relationships, Forecasting, Souteast U.S., Coastal plains.
Identifiers: Southern Coastal Plain.

Methods are presented for estimating water loss and consumptive use in the Southern Coastal Plain. Soil and water losses were measured from two fallow plots during a 7-yr period, 1960-1966. The average rainfall of 48.53 inches had an average EI value of 373, which was close to the long-time average of 350. The plots were on Tifton loamy sand with 3% slope, 83 ft in length and 1/20 acre in size. A stepwise regression analysis of rainfall parameters was made on a storm and annual basis for soil and water losses. For the storm basis, EI explained 52% of the variation of soil loss. A maximum percentage of 66% was found with 14 parameters, and an equation was written with 6 parameters explaining 64% of the variation in soil loss. For the annual basis, the maximum 30 min intensity explained 82% of the variation for soil loss. An equation was written with 5 parameters that explained 97% of the variation in soil loss. The kinetic energy explained 63% of the variation of water loss for the storm basis. A maximum percentage of 71 was obtained from all the parameters; however, 5 parameters gave an equation for predicting water loss with 69% of the variation explained. For the annual basis, the maximum 30-min intensity explained 79% of the variation in water loss, and a prediction equation with 5 parameters was written that explained 96% of the variation. These prediction equations should be helpful in planning conservation practices in the Southern Coastal Plain. (Knapp-USGS)

VARIATIONS OF RAINFALL FREQUENCY IN RELATION TO DROUGHT ON THE EAST COAST,
Ministry of Works, Napier (New Zealand).
P. J. Grant.
J Hydrol, New Zeal, Vol 7, No 2, p 124-135, 1968. 12 p, 2 fig, 6 tab, 14 ref.

Descriptors: *Droughts, *Rainfall, *Climatology, Statistical methods, Weather, Precipitation (Atmospheric), Runoff forecasting, Infiltration, Rainfall-runoff relationships.
Identifiers: *New Zealand, Rainfall frequency, Rainfall effectiveness index.

Daily rainfall frequencies in New Zealand were analyzed using consecutive-year plots and cumulative-departure curves. It is shown that since the end of the 19th century there have been pronounced periodic changes in the frequencies of the larger daily rains. In spring, summer and autumn - winter was not analyzed in detail periodic mean rainfall, since 1890, is positively related to both frequency and percentage contribution of rains greater than 1.50 inches. Mean periodic rainfall effectiveness (R.E.) indices are presented. Abrupt decreases of R.E., or increases in drought severity, occurred in spring and summer during 1905-6, and in autumn about 1911. A further abrupt increase in drought severity occurred in spring about 1920. In summer, the most droughty period of this century was 1946-58; for autumn the current period since 1958 is the most droughty. Some of these changes of R.E. probably have practical significance, especially in relation to tree growth and some aspects of streamflow. The connection between frequency changes of the larger rains and changes of atmospheric circulation is briefly discussed. (Knapp-USGS)

A MATHEMATICAL CATCHMENT MODEL FOR ESTIMATING RUNOFF,
Lincoln Coll., Canterbury (New Zealand). Dept. of Agricultural Engineering.
W. C. Boughton.
J Hydrol, New Zeal, Vol 7, No 2, p 75-100, 1968. 26 p, 9 fig, 8 tab, 20 ref, 1 append.

Descriptors: *Model studies, *Rainfall-runoff relationships, *Mathematical models, *Simulation analysis, Computer programs, Digital computers, Hydrograph analysis, Synthetic hydrology, Hydrologic budget, Water balance, Evapotranspiration, Water storage, Infiltration.
Identifiers: Watershed models.

The development of mathematical catchment models from past studies of catchment water balance is reviewed. The structure and operation of a catchment model which uses daily rainfalls to estimate daily volumes of runoff is described. A steepest-ascent method for evaluating variables in the model is described and the results obtained with the model on 5 catchments in New Zealand are reported. Computer program listings and instructions for use of the model are included. The basis of the model is a water balance between input as rainfall; output as evapotranspiration, runoff, and infiltration; and change in storage. The model simulates continuous catchment behavior, in drying as well as runoff, rather than simulating only storage-delay behavior. (Knapp-USGS)

2C. Snow, Ice, and Frost

COMPARISON OF MORAINES FORMED BY SURGING AND NORMAL GLACIERS,
Geological Survey of Canada, Calgary (Alberta).
Nathaniel W. Rutter.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 991-999, Aug 1969. 9 p, 8 fig, 2 tab, 18 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Glacial drift, *Stratigraphy, Ice, Movement, Rheology, Sediments, Deposition (Sediments).
Identifiers: Glacier surges, Moraines.

A Neoglacial moraine of Bighorn Glacier, St. Elias Mountains, Yukon, probably formed by a surging glacier, and a Neoglacial normal moraine of nearby Grizzly Glacier were studied. Surficial deposits and erosional features were mapped. Fabric analyses were done in till at 5 sites in each moraine. Samples

were subjected to laboratory lithologic and texture analyses. The Bighorn (surge) moraine is a thin, discontinuous, irregular mantle till, but including ice-contact stratified material. Lateral moraines show subdued ridges marking the upper limit of glaciation. Ground moraine of the Grizzly (normal) glacier is an irregular, continuous, thick mantle, mostly till and ice-contact stratified material. Upper ice limits are marked by prominent ridges. Rocks of similar lithologies within the till are concentrated in bands parallel to glacier flow. Stones in till of the Grizzly moraine have strong preferred orientation roughly in the direction of glacier flow. In the Bighorn moraine, rocks in till are weakly oriented. Where orientation is apparent, it is not necessarily in the flow direction. For the size fraction finer than 2 mm, Bighorn till is coarser than Grizzly till although the bedrock terrain is similar. These differences are useful in distinguishing moraines of normal and surging glaciers. (Knapp-USGS)
W70-00007

OBSERVATIONS OF THE SURGE OF STEELE GLACIER, YUKON TERRITORY, CANADA,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
A. D. Stanley.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 819-830, Aug 1969. 12 p, 4 fig, 2 tab, 22 ref.

Descriptors: *Glaciers, *Flow, *Surges, Rheology, Ice, Movement, Regimen, Melting, Water, Climates, Temperature.
Identifiers: *Canada, *Yukon Territory, Steele Glacier, Glacier surges.

For part of 1966, Steele Glacier in the Icefield Ranges, Yukon Territory, Canada, made a spectacular advance at a rate exceeding 500 m per month. The main part of the surge continued for two yr, but by early 1968 the advance had slowed to less than one tenth of the maximum rate. For most of the 35-km length of the main trunk the surface was a chaotic jumble of ice blocks, spires, and pinnacles, but large structures outlined by surface moraine were preserved. Most of these structures had been displaced 8 km by August 1967, irrespective of their location. Preliminary measurements indicate structures were displaced similar distances down the length of the glacier and suggest that most of the glacier moved forward as a block. The surge has not been correlated with any local earthquake activity, and there is no evidence for a short-term climatic change. The movement is considered to result from critical dynamic conditions within the glacier, possibly facilitated by increased amounts of water along the ice-bedrock contact. (Knapp-USGS)
W70-00009

ICE-SHEET SURGES AND THE GEOLOGICAL RECORD,
Princeton Univ., N.J. Dept. of Geology.
John T. Hollin.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 903-910, Aug 1969. 8 p, 2 fig, 39 ref. NSF Grant No GA-3920.

Descriptors: *Glaciers, *Flow, *Surges, *Antarctic, *Paleoclimatology, Pleistocene epoch, Quaternary period, Movement, Ice, Rheology, Melting, Water, Climates, Temperature, Weather, Albedo.
Identifiers: *Ice caps, Paleoglaciology, Antarctic ice cap, Ice cap surges, Glacier surges.

If they had occurred, ice-sheet surges would have caused sea-level rises of up to 50 m from Gondwanaland and 20 m from Antarctica. The rises would have taken 100 yr or much less, and the subsequent falls would have taken 50,000 yr or so, as the ice built up again. Such rises may explain the extensive and sharp coal - marine shale contacts in the Carboniferous cyclothems. The chief rival explanation for these contacts is sudden subsidence. Tests should show (1) if such contacts are better correlated with periods of glaciation or with areas of tectonic activity, (2) how extensive the contacts really are, (3) if there is any evidence of erosion during sea-level falls, (4) if the amplitudes and periods of the cycles fit surges or subsidence, (5) how fast the submergences were, and (6) if any coolings began at the contacts. Wilson suggests that in the Pleistocene the surge coolings were sufficient to trigger the northern ice ages. If so, interglacial pollen profiles should show rapid but temporary marine transgressions beginning at the break of climate. Evidence suggesting such transgressions occurs in England and the United States, but is still insufficient to disprove explanations such as local downwarping. There is no evidence yet for surges in Wisconsin or Post-glacial time. There is some evidence that the Antarctic Ice Sheet is currently building up, but this could be a response to a Post-glacial accumulation increase rather than the prelude to a surge. (Knapp-USGS)
W70-00013

THE CLIMATIC EFFECTS OF LARGE-SCALE SURGES OF ICE SHEETS,
Victoria Univ., Wellington (New Zealand). Dept. of Chemistry.
A. T. Wilson.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 911-918, Aug 1969. 8 p, 10 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Antarctic, *Paleoclimatology, Pleistocene epoch, Quaternary period, Movement, Ice, Rheology, Melting, Water, Climates, Temperature, Weather, Albedo.
Identifiers: *Ice caps, Paleoglaciology, Antarctic ice cap, Ice cap surges, Glacier surges.

Surges in ice masses of glacier size are now well accepted in glaciology. There seems no reason why a similar phenomenon should not occur in bodies of ice as large as continental ice sheets. If a continental ice sheet surged into the sea it would have a considerable effect on world sea-level. This is proposed as the mechanism of past sea level fluctuations (cyclothems) of the Carboniferous and Tertiary. The effect of a surge of the Antarctic Ice Sheet on world climate is considered, with particular reference to the origin of ice ages. The requirements of an ice-age mechanism are discussed and it is concluded that a periodic surge of the Antarctic Ice Sheet, perhaps induced by a decrease in insolation to the south polar region, has all the requirements of an ice-age inducing mechanism. In particular, any oscillating system must have capacitance (storage) and impedance (resistance). It is not easy to find a system in nature with a sufficiently long period of oscillation. However, the build up of ice on Antarctica would provide a sufficiently slow charging of storage, and the ice sheet itself would provide the storage to yield a system of long enough period. It is proposed that when the Antarctic Ice Sheet surges, a large ice shelf is produced which increases the albedo of the Earth. The resulting cooling leads to the formation of secondary ice sheets in the Northern Hemisphere, which in turn leads to a further increase in albedo and further cooling. The break up of the ice shelf and its replacement by ocean would lead to a large decrease in the Earth's albedo. The resulting warming would lead to the rapid melting of the subsiduary ice sheets and the ending of the ice age. (Knapp-USGS)

INITIATION OF GLACIER SURGES,
Scott Polar Research Inst., Cambridge (England).
G. De Q. Robin.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 919-928, Aug 1969. 10 p, 6 fig, 11 ref.

Descriptors: *Glaciers, *Flow, *Surges, Movement, Ice, Rheology, Melting, Water, Climates, Temperature, Regimen, Stress, Strain.
Identifiers: Glacier surges.

Three types of instability leading to glacier surges have been suggested, namely stress instabilities, temperature instabilities, and water-film instabilities. Evidence of approximately equal volumes of ice being involved in repeated surges of the same glacier favors stress instabilities as the most likely cause. Since for a steady rate of discharge a section of a glacier undergoing extending flow tends to be of the order of thirty meters thicker than for compressive flow under otherwise similar conditions, it is suggested that surges originate when the glacier flow switches between these two modes of flow. In the accumulation zone of a glacier, a surge would be triggered off by a change from extending to compressive flow over a length of the glacier. If the volume of ice and movement velocities involved are sufficiently large this could lead to repeated surging, although a tendency to stability appears to exist. In the ablation zone, glacier acts as a rigid, sliding dam and increases ice thickness upstream. In this zone, if the volume discharge of the glacier increases beyond a critical limit that depends on bedrock topography, it would initiate a surge. (Knapp-USGS)

WATER LUBRICATION MECHANISM OF GLACIER SURGES,
Northwestern Univ., Evanston, Ill. Dept. of Materials Science; and Army Terrestrial Sciences Center, Hanover, N.H.
J. Weertman.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 929-942, Aug 1969. 14 p, 2 tab, 44 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Floating, Melting, Water, Ice, Movement, Rheology, Temperature, Climates, Regimen, Stress, Strain.
Identifiers: Glacier surges.

A theory of glacier surges is reviewed and amplified. This theory is based on the premise that a glacier surge occurs when a water layer at the base of a glacier attains a thickness sufficient to drown the obstacles in the bed that offer the greatest hindrance to sliding. In the case of a glacier bed which is very smooth, the stress concentrations in the vicinity of obstacles in the bed are so high that the power-law creep equation is no longer valid. As a consequence, the size of the controlled obstacles is reduced and thus a surge is more likely to occur. (Knapp-USGS)

THE ICE-DAM, POWDER-FLOW THEORY OF GLACIER SURGES,
Monsanto Co., St. Louis, Mo.
Lawrence E. Nielsen.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 955-961, Aug 1969. 7 p, 6 fig, 9 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Rheology, Ice, Movement, Stress, Strain, Viscosity, Regimen, Temperature, Stability, Plasticity, Mechanical properties.
Identifiers: *Glacier surges, Powder flow, Ice dams, Stagnant ice.

To explain glacier surges, it is assumed that a stagnant ice block or dam develops in the lower regions of a glacier. Ice gradually builds up above the dam while the dam itself becomes thinner by ablation. Eventually the upper end of the stagnant ice block crumbles from the force of the ice above it, and much of the glacier is changed from a state of compression to one of tension. The breaking of the ice dam results in the glacier rapidly becoming broken into a mass of blocks or powdered ice. The apparent viscosity of the broken-up glacier is much less than that of bulk ice, so high velocities of flow are possible, and a phenomenon similar to a mud flow results. This theory explains why some glaciers repeatedly surge yet appear stagnant between surges. The broken-up appearance of surging glaciers and the delayed surging of tributaries are explained. Additional substantiating observations on several of these phenomena are presented. (Knapp-USGS)

DEFORMATION OF ICE UNDER HIGH INTERNAL SHEAR STRESSES,
McGill Univ, Montreal (Quebec). Dept. of Metallurgical Engineering; and McGill Univ., Montreal (Quebec). Dept. of Geography.
John J. Jonas, and Fritz Muller.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 963-968, Aug 1969. 6 p, 6 fig, 6 ref. Canada Defense Res Board Grant No 9511-73.

Descriptors: *Ice, *Rheology, *Flow, *Stress, Plasticity, Viscosity, Melting, Freezing, Crystal growth, Shear stress, Strain, Mechanical properties.
Identifiers: Ice deformation, Dynamic recrystallization.

By means of transparent plastic dies, cylindrical samples of single crystal and polycrystalline ice were extruded into rods of one quarter the original cross-section area. The deformation was carried out at -5 deg C and a mean strain rate of about .01/s. With the aid of polarized light, the formation of cracks and the occurrence of dynamic recrystallization were studied. The experiments of Steinemann, and more recent results in metals suggest that, during such plastic flow, two types of dynamic recrystallization are involved. At low strain rates, the recrystallization is periodic, leading to rapid increases in strain rate at constant applied stress; at higher strain rates, the recrystallization is continuous and the strain rate is constant. The possibility that dynamic recrystallization of the periodic type is associated with glacier surges is discussed. (Knapp-USGS)

SEMINAR ON THE CAUSES AND MECHANICS OF GLACIER SURGES, ST. HILAIRE, CANADA, SEPTEMBER 10-11, 1968: A SUMMARY,
Geological Survey, Tacoma, Wash.
Mark F. Meier.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 987-989, Aug 1969. 3 p.

Descriptors: *Glaciers, *Flow, *Surges, *Rheology, *Conferences, Reviews, Regimen, Melting, Movement, Ice, Physical properties, Mechanical properties, Plasticity, Viscosity, Climates, Temperature.
Identifiers: *Glacier surges.

A symposium on glacier surges was held in St. Hilaire, Canada, September 1968. As a result of this symposium certain points appear now to be quite well established. Many surging glaciers exist and many types of glaciers surge. However, no surging glaciers which are below freezing at their beds have yet been identified. Surging glaciers occur only in certain limited areas, and these areas apparently are not related to climate, so that some property at the glacier bed must be a necessary condition for a glacier surge. Most, if not all, surging glaciers surge repeatedly and with a period which is reasonably constant. The cause of surges apparently involves drastic changes in bed friction which might be related to water at the bed, either as a thin film or in isolated pockets. However, some very important questions are still outstanding. The temperature regimes in surging glaciers are still unknown. Whether there is a continuous spectrum of behavior from surging glaciers to ordinary 'normal' glaciers, or whether surging glaciers are a class apart, is still an open question. The relation of surging glacier periodicity to mass balance changes or climatic histories cannot yet be defined. The exact role of water at the bed as well as the proper concept of bed roughness have not yet been defined adequately. It was not possible to define glacier surges in a completely satisfactory way, partly because different glaciologists place emphasis on different aspects of this interesting phenomenon. (Knapp-USGS)

GLACIAL ACTIVITY PRECEDING THE 1956 MULDROW GLACIER SURGE IN ALASKA,
Washington Univ., Seattle. Dept. of Electrical Engineering.
A. E. Harrison.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 1001-1007, Aug 1969. 7 p, 7 fig, 6 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Alaska, Surveys, Aerial photography, Climates, Temperature, Melting, Ice, Rheology, Movement, Regimen.
Identifiers: *Glacier surges, Muldrow Glacier (Alaska).

Photographic evidence suggests that a normal wave of ice was progressing down the Muldrow Glacier prior to the occurrence of the surge in 1956. The ice thickening began before 1947, with a wave motion of about 250 m per yr between 1948 and 1952. Progress may have slowed after 1952 because the bulging lateral margin had not reached the McGonagall Pass by 1954. The ice opposite McGonagall Pass thickened spectacularly after 1954 and a lateral ice cliff extended at least 1.6 km beyond McGonagall Pass when the ice began its surge movement in 1956. Aerial photographs taken after the surge ended in 1957, plus photographs from the ground in the vicinity of the bend in the Muldrow before surge motion reached that area in 1956, suggest that several small tributaries were also rejuvenated just before the surge occurred. These observations point to the possibility of climatic synchronism in the Alaskan Range and the southern ranges of North America. (Knapp-USGS)

RECENT OBSERVATIONS ON THE SURGING OTTO GLACIER, ELLESMERE ISLAND,
Defense Research Establishment Ottawa (Ontario). Geophysics Section.
G. Hattersley-Smith.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 883-889, Aug 1969. 7 p, 4 fig, 10 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Surveys, Aerial photography, Movement, Ice, Rheology, Melting, Water, Climates, Temperature, Regimen.
Identifiers: *Ellesmere Island, Glacier surges.

Air photographs show that the Otto Glacier in northwestern Ellesmere Island started to surge sometime between 1950 and 1959, with the result that the terminus advanced about 3 km as a floating ice tongue. Maps prepared from the 1959 photographs and from additional photographs taken in 1964 show a further advance of 2-3 km. Information from a subglacial relief map of the terminal part of the glacier, constructed from the results of radio-depth sounding over the glacier in 1966, may have a bearing on the mechanism of glacier surges. Other glaciers in northern Ellesmere Island show features indicative of past surges. (Knapp-USGS)

WHAT ARE GLACIER SURGES,
Geological Survey, Tacoma, Wash. Water Resources Div.
Mark F. Meier, and Austin Post.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 807-817, Aug 1969. 11 p, 4 fig, 1 tab, 7 ref.

Descriptors: *Glaciers, *Flow, *Surges, Cryology, Ice, Movement, Regimen, Rheology, Surveys, Climates, Temperature, Glacial drift, Sediments.
Identifiers: *Surging glaciers, Glacier surges.

A total of 204 surging glaciers has been identified in western North America. These glaciers surge repeatedly and probably with uniform periods (from about 15 to greater than 100 yr.). Ice flow rates during the active phase may range from about 150 m/yr to more than 6 km/yr, and horizontal displacements may range from less than 1 to more than 11 km. Ice reservoir and ice receiving areas can be defined for surging glaciers, and the reservoir area does not necessarily coincide with the accumulation area. Glaciers, of all shapes, sizes, and longitudinal profiles can surge, and no unusual 'ice dams' or bedrock constrictions are evident. Surges occur in many different climatic, tectonic, and geologic environments, but only certain limited areas (mainly in the Alaska, eastern Wrangell, and St. Elias mountains). Three types of surging glaciers are defined: (1) large to moderate-sized glaciers with large displacements and very fast flow, (2) large to moderate glaciers with moderate displacements and flow rates, and (3) small glaciers with small displacements and moderate to fast flow rates. All three types involve an inherent instability which is self-triggered at regular intervals, but with Type 1 surges an additional (unknown) mechanism produces the very high flow rates. (Knapp-USGS)

CURRENT OBSERVATIONS ON THREE SURGES IN GLACIER BAY, ALASKA, 1965-1968,
American Geographical Society, New York.
William O. Field.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 831-839, Aug 1969. 9 p, 8 fig, 7 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Alaska, Rheology, Ice, Movement, Regimen, Melting, Water, Climates, Temperature.
Identifiers: *Glacier surges, Glacier Bay (Alaska).

Nine glaciers in Glacier Bay, in southeastern Alaska, and three others within a radius of 60 km have been known to surge in the last 60 yr. Of these, seven have surged during the 1960's. The surges of three of them, the Tyeen, Rendu, and Carroll, are discussed in this paper. Each glacier has surged one or more times previously. The course of each surge has been documented by photography but there has been no study of the regimens of these glaciers. The distribution in time and space of these and other surges in the Glacier Bay area are discussed and it is suggested that there may be external factors which cause more surges during some periods than others. These relationships need to be correlated and analyzed. A program of future observations is suggested. (Knapp-USGS)

SURGES OF THE VERNAGTFERNER IN THE OTZTAL ALPS SINCE 1599,
Innsbruck Univ. (Austria).
Herfried C. Hoinkes.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 853-861, Aug 1969. 9 p, 6 fig, 2 tab, 20 ref.

Descriptors: *Glaciers, *Flow, *Surges, Rheology, Ice, Movement, Regimen, Melting, Water, Climates, Temperature.
Identifiers: *Austria, Tyrol, Vernagtferner, Surging glaciers, Glacier surges.

The history of catastrophic advances of Vernagtferner (Otztal Alps, Tyrol) is described briefly. To all appearances these advances were surges. They occurred periodically with a short active advance and a much longer time of retreat; the whole cycle lasted on an average 82 yr. The mode of flow of the ice changed typically; speed during surges increased more than one order of magnitude with heavy crevassing. Dimensions of advance and of retreat were much longer than known from other glaciers in the area. (Knapp-USGS)

EVIDENCE FOR AN ANCIENT GLACIER SURGE IN THE SWISS ALPS,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau und Erdbau.
H. Rothlisberger.
Canadian J Earth Sci, Vol 6, No 4 Part 2, p 863-865, Aug 1969. 3 p, 1 fig, 2 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Debris avalanches, Rheology, Ice, Movement, Regimen, Melting, Water, Climates, Temperature, Reviews.
Identifiers: *Switzerland, Alps, Glacier surges.

The climatic and glacial history of two locations in the central Alps has been discussed by Zoller et al. (1966). A brief outline of one aspect of this work is given. In order to explain some peculiar lateral moraines which are only 30-50 m above the valley floor, and a thick layer of presumably glacial deposit down valley, a surge has been postulated, which was triggered by a rock avalanche onto the glacier. (Knapp-USGS)

SOME COMMENTS ON GLACIER SURGES IN EASTERN SVALBARD,
Stockholm Univ. (Sweden). Dept. of Physical Geography.
V. Schytt.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 867-873, Aug 1969. 7 p, 3 fig, 15 ref.

Descriptors: *Glaciers, *Flow, *Surges, Surveys, Regimen, Movement, Ice, Rheology, Melting, Water, Climates, Temperature.
Identifiers: *Spitsbergen, Glacier surges.

Between 1936 and 1938 a great amount of ice flowed out from Sorfonna (the South Ice) on the south coast of Nordaustlandet. What had been an even slope of the ice sheet in 1936 developed into a badly crevassed glacier tongue by 1938, pushing approximately 20 km out to the sea along a front of 30 km. The new glacier was named Brasvellbreen, which in fact means 'rapid growth glacier', but because of World War II, no field investigations could be carried out until more than 10 yr after its discovery. The majority of glaciers in eastern Vestspitsbergen have retreated during this century a few, however, have advanced considerably during short periods and taken part in the general retreat during the rest of the time. Air photographs from 1024, 1938, 1956, and 1957 show that most of the ice edge in western Nordaustlandet has remained stable Sore Franklinbreen, however, has shown large oscillations. The glaciers in the area belong to the sub-polar type, i.e. the 10-m ice temperature in the ablation area remains at about 8-10 deg below zero throughout the yr, whereas the 10-m firn temperature in the accumulation area is at or very near freezing point. There are large variations in accumulation conditions from one Spitsbergen glacier to the other. The west coast of Vestspitsbergen is under the influence of mild and wet air masses from the Atlantic- the east coast is far more continental. The Nordaustlandet ice caps, on the other hand, receive most of their accumulation with winds from the Barents Sea. Annual net balance values of 80-120 g/sq cm are quite common on the eastern slopes of Austfonna (the East Ice), values of 70-90 g/sq cm have been observed along the crest of Sorfonna, and it is likely that large parts of the accumulation area of Brasvellbreen itself receives an annual net balance of between 50 and 90 g/sq cm. (Knapp-USGS)

GLACIER SURGES IN ICELAND, WITH SPECIAL REFERENCE TO THE SURGES OF BRUARJOKULL,
Museum of Natural History, Reykjavik (Iceland). Dept. of Geology and Geography.
Sigurdur Thorarinsson.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 875-882, Aug 1969. 8 p, 8 fig, 1 tab, 7 ref.

Descriptors: *Glaciers, *Flow, *Surges, Movement, Ice, Rheology, Surveys, Melting, Water, Climates, Temperature, Regimen.
Identifiers: *Iceland, Bruarjokull, Glacier surges.

The glacier surges that have occurred in Iceland since 1890 are listed, and the largest ones, those of Bruarjokull in 1890 and 1963-64, are described. The glacier area affected by the surges of Bruarjokull is about 1,400 sq km, the volume of ice and firn affected is about 700 sq km, and the total advance of the glacier front is 8-10 km. The maximum rate of advance of the glacier front in 1963 was at least 5 m/hour. Bruarjokull's surges seem to occur with an interval of 70-100 yr. (Knapp-USGS)
W70-00029

WAS THE GOOD FRIDAY GLACIER ON AXEL HEIBERG ISLAND SURGING,
McGill Univ., Montreal (Quebec).
Fritz Muller.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 891-894, Aug 1969. 4 p, 2 fig, 3 ref.

Descriptors: *Glaciers, *Flow, *Surges, Movement, Ice, Rheology, Melting, Water, Climates, Temperature, Regimen.
Identifiers: *Canada, *Axel Heiberg Island, *Glacier surges.

The lower part of the Good Friday Glacier on Axel Heiberg Island, N.W.T., started, sometime between 1952 and 1959, a period of markedly increased movement associated with a frontal advance of over 2 km, which showed clearly some of the features attributed to a glacier surge, while others were lacking. Such border cases merit special attention. (Knapp-USGS)

GLACIER SURGES IN WEST SPITSBERGEN,
Norsk Polarinstitutt, Oslo.
Olav Liestol.
Canadian J Earth Sci, Vol 6, No 4 Part 2, p 895-897, Aug 1969. 3 p, 2 fig, 2 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Melting, Water, Movement, Ice, Rheology, Climates, Temperature, Regimen.
Identifiers: *West Spitsbergen, Glacier surges.

Surges constitute a common form of glacier advance in Spitsbergen. The fastest movement observed is that of the Negri Clacier, with an advance of about 12 km in less than a yr. Observations on the Finsterwalder Glacier indicate that the ice flow is too small to maintain a steady-state slope. At intervals, of the order of 100 yr, the glacier will balance this build-up by surging. A small surging glacier in the Dickson Valley has a sheet of refrozen meltwater in the front. This refrozen meltwater is possibly generated by the surge. (Knapp-USGS)
W70-00031

EVIDENCE OF SURGES ON THE BARNES ICE CAP, BAFFIN ISLAND,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
O. H. Loken.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 899-901, Aug 1969. 3 p, 1 fig, 2 ref.

Descriptors: *Glaciers, *Flow, *Surges, Movement, Ice, Rheology, Melting, Water, Regimen, Climates, Temperature, Streamflow.
Identifiers: *Canada, *Baffin Island, Glacier surges.

The morphology of the Barnes Ice Cap is studied on the basis of detailed topographic maps. Two anomalous areas characterized by an apparent excess of mass at lower elevations and a similar deficit at higher altitudes are identified. Local surges affecting these two parts of the ice cap could have caused this mass distribution. The moraine patterns adjacent to the ice cap show that the ice margin in the two areas has recently advanced in distinct contrast to the general retreat in adjacent areas. (Knapp-USGS)

PROPAGATION OF GLACIER SURGES,
Scott Polar Research Inst., Cambridge (England); and Cambridge Univ. (England). Cavendish Lab.
G. De Q. Robin, and P. Barnes.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 969-977, Aug 1969. 9 p, 6 fig, 11 ref.

Descriptors: *Glaciers, *Flow, *Surges, Stress, Strain, Plasticity, Viscosity, Melting, Water, Ice, Freezing, Shear stress, Temperature, Mechanical properties, Velocity, Friction.
Identifiers: *Glacier surges, Ice deformation.

Propagation of glacier surges has been discussed in terms of stresses acting in the three major zones of the surge. The steeply sloping front of a surge appears sufficient to explain the thickening of a glacier and the rise in velocity of ice motion which takes place across this zone in terms of accepted stress-strain rate data for ice. Explanation of the high velocities which occur in the next zone in spite of little change in the available shear stress is more difficult, but the experimental results of Barnes and Tabor on ice close to the melting point appear to offer an explanation of the unusually high rates of flow. In the tensile zone, where velocities slow down, the net lowering of the glacier surface after the surge has passed is explained in terms of the depth of crevassing and easier flow of ice at melting point when under tensile and shear stresses. A LATE-PLEISTOCENE GLACIAL SEQUENCE FROM PRINCE OF WALES ISLAND, ALASKA,
Forest Service (USDA) Pacific Northwest Forest and Range Experiment Station, Juneau, Alaska.
D. N. Swanston.
Arctic 1969, 22 (1):25-33. 4 fis (1 map), 8 ref.

Descriptors: *Glaciation, *Glacial soils, *Glacial till, *Moraines, Geomorphology, Pleistocene epoch, Alaska.
Identifiers: Glacial geology, Glacial sequences, Regional glaciation, Recessional moraines, Glacial advance, Southeast Alaska.

Evidence of two late-Pleistocene glacial advances is exposed in Maybeso Creek valley. A cemented 'younger' till with a shallow weathered zone directly overlies a thoroughly leached and partly oxidized 'older' till. The younger till was deposited by a glaciation of regional extent representing the last major glacial advance of classical Wisconsin age in southeast Alaska. The older till may also represent a regional glaciation, tentatively correlated with an intermediate to early-late Wisconsin age. Four recessional moraines in the valley record dying pulsations of the glaciation that deposited the younger till during the early part of the late glacial interval preceding the Hypsithermal. RAPID HEAT-FLOW SURVEYING OF GEOTHERMAL AREAS, UTILIZING INDIVIDUAL SNOWFALLS AS CALORIMETERS,
Geological Survey, Menlo Park, Calif.
Donald E. White.
J Geophys Res, Vol 74, No 22, p 5191-5201, Oct 15, 1969. 11 p, 7 fig, 1 tab, 12 ref.

Descriptors: *Geothermal studies, *Heat flow, *Snowfall, *Surveys, Springs, Thermal water, Thermal radiation, Winds, Air temperature, Mapping, Contours, Computers, Infrared radiation.
Identifiers: *Yellowstone Park (Wyo), Heat-flow survey.

Individual heavy snowfalls were utilized for a rapid low-cost means of measuring the total heat flows in hot spring areas of Yellowstone Park, Wyoming. The method consists of mapping on a suitable base the contacts between snow-covered and snow-free ground after a favorable snowfall (heavy snow, brief duration, air temperature near 0 deg C). Each mapped contact as time elapses after a specific snowfall, is a heat flow contour representing a decreasing rate of flow. Heat flow contacts mapped to date vary from 450 to 5500 micro cal/sq cm sec, or 300 to 3700 times the world average of conductive heat flow. Thermal anomalies from infrared imagery are similar in shape to heat-flow contours of a test area near Old Faithful Geyser of the Yellowstone Park. (Gabriel-USGS)

A CONTRIBUTION TO THE THEORY OF GLACIER SURGES (IN FRENCH),
Centre National de la Recherche Scientifique, Grenoble (France). Laboratoire de Glaciologie.
Louis A. Lliboutry.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 943-953, Aug 1969. 11 p, 5 fig, 1 tab, 17 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Friction, Movement, Ice, Rheology, Stress, Strain, Viscosity, Melting, Water, Regimen, Climates, Temperature.
Identifiers: Glacier surges.

Glacier surges may result (1) from the warming of a cold glacier, which follows an unusual snow cover, with the formation of a temperature basal layer, or (2) from the fact that two values of the sliding velocity correspond to a single value of the friction. As a rule, for increasing sliding velocities the friction goes through a maximum and next through a minimum. Thus for one value of the friction three values of the velocity, two stable ones and an unstable one, can exist. Since the derivative of the friction with respect to the sliding velocity may become negative, the coefficients in the perturbation equation may become infinite (their ratio remaining finite), and next negative. When a flood wave runs down a glacier, an area with a negative diffusion coefficient may appear. Then the profile of the wave is altered; it vanishes at the upper part of this area and swells beyond measure at the lower one. Factors which may limit the amplitude of this surge are pointed out. GLACIER SURGES IN THE KARAKORAM HIMALAYA (CENTRAL ASIA),
Toronto Univ. (Ontario). Dept. of Geography.
Kenneth Hewitt.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 1009-1018, Aug 1969. 10 p, 2 fig, 1 tab, 71 ref.

Descriptors: *Glaciers, *Flow, *Surges, *Reviews, *Bibliographies, Alaska, Movement, Ice, Rheology, Temperature, Mountains, Climates, Melting, Water, Freezing.
Identifiers: *Karakoram, Yukon, Glacier surges.

The Karakoram and Alaska-Yukon region between them account for perhaps 90% of the known surging glacier events. While modern research and information is available for North America, the Karakoram, though often referred to, remains virtually unknown except in a very general sense. The prime aim of this paper is to collate all the information that is available for the Karakoram from the usually old and inaccessible documents where it is found. It establishes eleven instances of surges with reasonable certainty and the probability of many more. The rare instances of detailed description of the phenomena are quoted. A short discussion is given of the degree to which the information, and knowledge of the Karakoram environment, equate with various mechanisms put forward to explain surging glacier events. (Knapp-USGS)

DISTRIBUTION OF SURGING GLACIERS IN WESTERN NORTH AMERICA,
Geological Survey, Tacoma, Wash.
Austin Post.
J Glaciol, Vol 8, No 53, p 229-240, 1969. 12 p, 5 fig, 1 tab, 13 ref.

Descriptors: *Glaciers, *Surges, *Regimen, *Alaska, *Surveys, Climates, Cryology, Ice, Mountains, Rheology, Frequency, Precipitation (Atmospheric), Flow, Friction, Heat flow.
Identifiers: *Surging glaciers, Glacial surges.

In western North America 204 surging glaciers have been identified by aerial photographic observations. These glaciers exhibit intense crevassing and rapid ice displacements during surges, or distinctive surface features which have resulted from past surges. Distribution of these unusual glaciers is not random throughout the glacierized areas, as they occur only in the Alaska Range, eastern Wrangell Mountains, eastern Chugach Mountains, Icefield Ranges, and the St. Elias Mountains near Yakutat and Glacier Bay. No surging glaciers have been identified in the Brooks Range, Kenai Mountains, west and central Chugach Mountains, west and central Wrangell Mountains, Coast Mountains, Rocky Mountains, Cascade Range, Olympic Mountains, or Sierra Nevada. No definite reason for this restricted distribution is apparent. Surging glaciers are found in maritime to continental and temperate to subpolar environments. Practically all physical forms of glaciers are represented. The restricted distribution does not relate to topography, bedrock type, altitude, orientation, or size of glacier. Some surging glaciers are associated with fault-related valleys, but neither recent faulting nor earthquakes have initiated surge activity. Possible causes for the limited distribution of surges are unusual bedrock roughness or permeability in certain areas, anomalously high groundwater temperatures, and abnormal geothermal heat flow. W70-00239

HEAT BUDGET OF AN ICE COVERED INLAND LAKE,
Wisconsin Univ., Madison.
John T. Scott, and Robert A. Ragotzkie.
ONR Contract 1202 (07). Task NR 387-022. Technical Report No 6, Department of Meteorology, University of Wisconsin, Oct, 1961. 5 p, 13 tab, 15 fig, 23 ref, 7 append.

Descriptors: *Heat budget, *Radiation, *Latent heat, *Advection, Conduction, Snow cover.
Identifiers: Heat storage, Lake Mendota.

The heat budget for Lake Mendota is evaluated for two winter seasons. Change in heat storage, radiation flux conduction and advection are determined separately for snow, ice and water where applicable. The general heat budget equation Rn= C+ E+ L is used where Rn is net radiation, C is change in heat storage and L is exchange of sensible heat between the surface and the air. It is observed that net radiation, air temperature and snow cover are the most important factors affecting the heat budget equation. With some improvement in the methods, the heat budget can be used as a check against instrumental techniques for determining sensible heat flux (L) because during winter, evaporation is often negligible for long cold periods. Seven distinct periods of the winter season are described using the heat budget data for the two years. (Upadhyaya-Vanderbilt)

CONVECTIVE CIRCULATION IN WATER INDUCED BY EVAPORATIVE COOLING,
National Bureau of Standards, Washington, D.C.
W. G. Spangenberg, and W. R. Rowland.
The Physics of Fluids, Vol 4, No 6, p 743-750, June 1961. 10 fig, 9 ref.

Descriptors: *Convection circulations, *Convection currents, Thermal pollution, Cooling water, Evaporation.
Identifiers: *Schlieren photographs, Fluid depth effects, Temperature distribution, Columnar plunging, Surface deformation.

Schlieren photographs taken simultaneously from the top and side of a tank of water are here used to study convection currents induced by evaporative cooling. It is found that water from the cooled surface layer collects along lines producing thickened regions which become unstable and plunge in vertical sheets. Surface water then continues to flow downward through the sheets, reducing the cooled surface layer to a thin film. In top schlieren views the plunging regions sometimes appear straight, sometimes curved, and branched or terminated with no fixed pattern. The number of lines per unit area is a function of the cooling rate rather than the depth of the container. Reticulated surface patterns were observed only at particular cooling rates and columnar plunging occurred only on rare occasions. No distinctly different combination of conditions to differentiate between the causes of these different modes was evident. Numerical integration of the nonlinear temperature distribution in the cooled layer showed a critical Rayleigh number of 1193 when convective circulation started, and a Rayleigh number of 102 for maintaining an established uniform circulation. (Ross-Vanderbilt)

DETERMINATION OF THE OPTIMUM STORAGE CAPACITY OF RESERVOIRS AND THE ASSOCIATED PROBABILITIES,
Ministry of Irrigation and Power, New Delhi (India).
K. C. Majumdar.
J Hydrol, Vol 8, No 3, p 303-322, Jul 1969. 20 p, 1 fig, 5 tab, 9 ref.

Descriptors: *Reservoir operation, *Streamflow forecasting, *Probability, Irrigation, Hydroelectric power, Water storage, Water management (Applied), Planning, Reservoir design, Computer programs, Statistical methods.
Identifiers: *India.

A method has been developed to determine the optimum storage capacity of a reservoir corresponding to different probabilities of the desired amount of water each year. The method considers a large number of random normal deviates to represent a simulated series of annual inflow data. For the purpose of determination of storage capacity of any dam, the probabilities of the reservoir fullness of emptiness were determined for different values of draft and storage capacities. These have been obtained by drawing 5152 simulated data and analyzing them in an IBM 1620 electronic computer. The results presented can be applied to any river basin of which annual runoffs obey the normal distribution law. A method of economically fixing the optimum storage capacity by taking into consideration the expected net return from the project is also indicated. (Knapp-USGS)

MAGNITUDE AND FREQUENCY OF FLOODS IN THE UNITED STATES: PART 2. PACIFIC SLOPE BASINS IN CALIFORNIA - KLAMATH AND SMITH RIVER BASINS AND CENTRAL VALLEY DRAINAGE FROM THE EAST,
Geological Survey, Washington, D.C.
L. E. Young, and R. W. Cruff.
Geol Surv Water-Supply Pap 1686, 1967. 308 p, 20 fig, 2 plate, 4 tab, 13 ref.

Descriptors: *Flood forecasting, *California, *Rainfall-runoff relationships, Streamflow forecasting, Routing, Stage-discharge relations, Topography, Water storage.
Identifiers: Flood frequency, Klamath River Basin (Calif), Smith River Basin, Central Valley.

A method is presented for determining the probable magnitude of annual maximum floodflows for any recurrence interval between 1.2 and 50 years for any stream, gaged or ungaged, in and near the Klamath and Smith River basins, California. The area has been divided into 4 regions of differing flood-frequency characteristics. The flood-frequency relat ion is undefined in one of these regions - the flat Central Valley because of the lack of records for unregulated streams within its boundaries. The hydrologic basin characteristics having the most significant effect on the flood magnitude were drainage area, mean annual precipitation, slope, and altitude. These were used as independent variables to derive equations for determining flood magnitudes for recurrence of 1.2, 2.33, 5, 10, 25, and 50 yr. From these equations, flood magnitude-frequency relations can be constructed. The procedure for computing flood magnitude is not applicable at sites where the drainage area is less than 10 sq mi or where the usable storage exceeds 4.5 million cu ft (103 acre-ft) per sq mi. (Knapp-USGS)

THE MECHANICS OF SURFACE RUNOFF,
Florida Univ., Gainesville. Dept. of Bioenvironmental Engineering.
John C. Schaake, Jr.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 105-116, 1967. 12 p, 5 fig, 1 tab, 12 ref.

Descriptors: *Runoff forecasting, *Mathematical models, *Digital computers, *Synthetic hydrology, Rainfall-runoff relationships, Routing, Unit hydrographs, Hydrograph analysis, Overland flow, Channel flow.
Identifiers: Drainage basin model.

The new digital computers with micro-second cycle times and core storage in excess of 30,000 words have made it practical to synthesize the surface runoff process by mathematical models. This synthesis involves simulating overland flow and flow in open channels and routing these flows through the watershed. The basic equations for the flow of flood waters in open channels and the basic equations for the overland flow of surface runoff have long been known to be the same, and they have been used by many investigators to route flood waves in rivers and to examine properties of overland flow hydrographs. Analytic solutions of these basic partial differential equations exist only for a few special cases of practical interest. In general, numerical solutions by finite difference methods are necessary. It is feasible and practical to synthesize the surface runoff process for small impervious watersheds. Runoff measurements are not needed so the procedure applies to ungaged areas. Friction coefficients must be estimated, but the computed hydrograph is not very sensitive to uncertainty in these coefficients. The mathematical model should be useful for studying the effects of the aerial variability of rainfall, for obtaining synthetic unit hydrographs for studying watershed linearity, and to provide data to test instrumentation designs for small watersheds. South Dakota Water Resources Institute, Research Project Technical Completion Report, September 1, 1969. 166 p, 5 ref, 7 append. OWRR Proj No A-012-SDAK.

Descriptors: Hydrograph, Hydrologic models, Runoff, *Surface runoff, *Unit hydrograph, *Watershed studies.

A study was made of nine South Dakota watersheds varying in size from two square miles up to 750 square miles to determine the usefulness of the parameter, 'The Time Base of the Instantaneous Unit Hydrograph.' This parameter was calculated from 100 storm runoff periods with no reference to the rainfall or 'rainfall excess' that was associated with the storm. A correlation analysis was run with the 'Time Base' and the physical measurements of the watershed. (Author)

Cheng-lung Chen, and Chun-Tsung Wang.
ASCE Proc, J Hydraul Div, Vol 95, No HY5, Pap 6790, p 1671-1686, Sept 1969. 16 p, 10 fig, 11 ref, append.

Descriptors: *Open channel flow, *Unsteady flow, *Flow profiles, *Hydraulic jump, Supercritical flow, Turbulent flow, Hydraulics, Chezy equation, Mannings equation, Regime.
Identifiers: Gradually varied flow.

Chezy's and Manning's flow formulas are used to formulate flow equations for gradually-varied flow in wide rectangular channels. The flow equations are normalized by critical depth and critical slope, so that a parameter governing the flow is evident. This parameter is called normal-flow Froude number for flow on sustaining (mild, critical, and steep) slopes, and conceptual normal-flow Froude number for flow on adverse slopes. No third parameter governs flow on the horizontal slope. Critical depth, critical slope, and the normal-flow Froude number can be systematically found from nomographs for flow of a given discharge per unit width in a wide channel of given channel slope and roughness. Hydraulic-jump equations can also be normalized with the same normalizing quantities used in flow equations. Solutions of normalized flow and hydraulic-jump equations are graphically expressed, permitting direct use. (Knapp-USGS)

Identifiers: *Brahmaputra River (India-Pakistan).

The Brahmaputra River, one of the largest rivers of the world, is international in character, originating in Tibet and flowing through India before reaching East Pakistan, and control of flooding from this river ia a major problem. The problem has been considered by several experts who have expressed the opinion that flood protection must be provided by river embankment. The Brahmaputra right bank embankment and the proposed left bank embankment are described. For the study of river regime and for developing design criteria for the flood control projects, detailed hydrographical and hydrological surveys of the river have been in progress since 1964. ONE-DIMENSIONAL ANALYSIS OF FLOODS AND TIDES IN OPEN CHANNELS,
Tippetts-Abbett-McCarthy-Stratton, New York.
Armando Balloffet.
ASCE Proc, J Hydraul Div, Vol 95, No HY4, Pap 6695, p 1429-1451, July 1969. 23 p, 14 fig, 2 tab, 6 ref, append.

Descriptors: *Flood forecasting, *Synthetic hydrology, *Mathematical models, Hydraulics, Floods, Hydrograph analysis, Tides, Unsteady flow, Deltas.
Identifiers: Orinoco River (Venezuela), Sinu River (Colombia).

The one-dimensional equations of gradually varied, unsteady flow in open channels are integrated to obtain stages and discharges along a river subject to tides and floods. An explicit procedure of finite differences is used, considering branches, independent tributaries (pumps), contractions due to bridges or barriers, with or without tidal gates, and flood plains restricted or not by levees. The boundary conditions may be represented by: tides at both ends; tides at one end and discharge at the other; surge or stage hydrographs at any station; and combinations of the previous conditions. Three examples are presented covering a wide range of conditions. (Knapp-USGS)

GENERATING SYNTHETIC STREAM-FLOW RECORDS FOR NEW ZEALAND RIVERS,
Lincoln Coll., Canterbury (New Zealand). Dept. of Agricultural Engineering.
W. C. Boughton, and A. McKerchar.
J Hydrol, New Zeal, Vol 7, No 2, p 112-123, 1968. 12 p, 3 fig, 2 tab, 14 ref, 1 append.

Descriptors: *Simulation analysis, *Synthetic hydrology, *Streamflow forecasting, *Rainfall-runoff relationships, Mathematical models, Hydrologic data, Statistical methods, Computer programs, Probability, Sampling, Hydrograph analysis, Regression analysis.
Identifiers: *New Zealand, Thomas-Fiering models.

The Thomas-Fiering model for generation of synthetic streamflow records has been used with data from some New Zealand catchments. Available records are sparse and only 4 gaging stations have records of more than 20 years. Possible errors which can occur when short records are used to estimate monthly means, serial correlations, etc., are demonstrated. A simple simulation model for testing the difference between historic and synthetic records in determining reservoir size is described. A digital computer program listing for the simulation model is included. (Knapp-USGS)

F. H. Pearson.
J Hydrol, New Zeal, Vol 7, No 2, p 101-111, 1968. 11 p, 2 fig, 11 ref, 1 append.

Descriptors: *Synthetic hydrology, *Hydrograph analysis, *Streamflow forecasting, *Rainfall-runoff relationships, Mathematical models, Hydrologic data, Statistical methods, Computer programs, Simulation analysis, Probability, Sampling.
Identifiers: *New Zealand.

Usually the length of a streamflow record is insufficient to contain extreme values and critical sequences required for the design of water-resource system components. Data are sometimes required for an ungaged stream. The Thomas-Fiering model may be used for the generation of a synthetic record of mean monthly streamflow of any required length. Data may be obtained by analysis of a shorter observed record for the stream, by analysis of regional characteristics of streamflow, or by analysis of the rainfall excess and consideration of storage in the catchment. Different considerations apply to the generation of synthetic flows for low-flow studies than for other types of problems. The extent to which the characteristics of an observed flow record will be reproduced in a synthetic record generated from the observed record is discussed. (Knapp-USGS)

FLOOD ROUTING WITH VARIABLE TRAVEL TIME OR VARIABLE STORAGE COEFFICIENTS,
Agricultural Research Service, Bushland, Tex.
Jimmy R. Williams.
Trans Amer Soc Agr Eng, Vol 12, No 1, p 100-103, Jan-Feb 1969. 4 p, 7 fig, 3 tab, 7 ref.

Descriptors: *Flood routing, Hydrology, Storage coefficient, Outflows, Hydrographs, Inflow, Floods, Computer programming, *Flood hydrographs, Methodology.
Identifiers: Variables, *Travel time, Variation coefficients, *Flood hydrology, Brushy Creek (Tex).

The variable travel-time method and the variable storage-coefficient method for flood routing are described. These methods maintain the runoff volume without gain or loss during the routing computation. Although based on previous work, the methods include refinements that improve the accuracy of predicting flood-wave movement. The basis for the methods is the universal law of storage; that is, for a given time interval, the change in storage in a given reach is equal to the volume of inflow minus the volume of outflow. Because the methods preserve the correct volume, they will fill a need long felt. Both procedures are logical and adaptable to most flood routing problems. Good results were obtained when the methods were used on the Brushy Creek watershed in Texas. (USBR)

A NEW METHOD OF INVESTIGATING RIVER RECESSION CURVES,
Raikes and Partners, Rome (Italy).
T. R. E. Chidley.
J Inst Water Eng, Vol 23, No 3, p 177-186, May 1969. 12 p, 8 fig, 8 tab, 3 ref.

Descriptors: *Rivers, *River forecasting, River regulation, Hydrology, *Recession curves, Hydrographs, Hydrologic data, Discharge (Water), Runoff, Surface runoff, Methodology, *Streamflow forecasting, Rainfall.
Identifiers: Usk River, Great Britain.

A method of analyzing and forecasting river recession curves soon (3 days) after cessation of rain is presented. The principle underlying the method is to isolate the recession rate rather than the actual recession and then to relate this to parameters known to affect the recession rate. In this case, river discharge (implicitly a measure of groundwater levels), antecedent conditions, and season were used; other more objective parameters could be used. The basis for the method is numerical, and any recession curve can be analyzed automatically from a set of rainfall and runoff data by either computer or manual methods. All subjectivity has been removed from the analysis except in the choice of parameters believed to affect the recession rate. The method can be used as a subroutine for simulation of runoff data from rainfall records when a river is receding. (USBR)

RECONNAISSANCE OF GEOLOGY AND OF GROUNDWATER OCCURRENCE IN WHITMAN COUNTY, WASHINGTON,
Geological Survey, Tacoma, Wash.
Kenneth L. Walters, and P. A. Glancy.
Wash Dep Water Resources Water Supply Bull No 26, 1969. 169 p, 8 fig, 4 plate, 5 tab, 19 ref, append.

Descriptors: *Water resources, *Groundwater, *Washington, Water wells, Aquifers, Hydrographs, Water levels, Water level fluctuations, Water yield, Water utilization, Irrigation water, Municipal

water, Water quality, Hydrogeology, Hydrologic data, Data collections.
Identifiers: Whitman County (Wash).

Whitman County covers about 2,200 sq. mi in southeastern Washington, adjacent to the Washington-Idaho boundary. Average annual precipitation in the county ranges from about 14 to 20 inches. Agriculture is the principal industry--chiefly dryland wheat farming, although some pasture and hay crops are irrigated. Much of the county is underlain by a thick sequence of basalt flows mantled by loess. Locally, older nonbasaltic crystalline rocks are exposed, principally in the eastern part of the county. The yield of large-diameter wells that penetrate several hundred feet of basalt in Whitman County is about 125 to 200 gpm for every 100 ft of saturated basalt penetrated. Adequate yields of water for domestic and stock supplies are commonly obtained from loess or from the contact between the loess and the underlying basalt. Pleistocene gravel deposits and Recent alluvium characteristically yield little water. Locally, however, yields of several hundred gpm are obtained from wells that penetrate the gravel, or the alluvium in the Snake River valley. Hydrographs of wells in the Pullman area indicate a continuing decline in water level. (Knapp-USGS)

INTERPRETATION OF FLUCTUATIONS IN A CARBONIFEROUS LIMESTONE AQUIFER AT MOUSCRON, BELGIUM (FRENCH),
Geologic Service of Belgium.
M. Gulinck.
Bull Int Ass Sci Hydrol, Vol 14, No 1, p 129-144, Mar 1969. 16 p, 13 fig.

Descriptors: *Aquifers, *Limestones, *Water level fluctuations, Hydrologic data, Pumping, Water wells, Water storage, Industrial plants, Water supply, Mathematical studies, Transmissivity, Theis equation, Seasonal, Permeability, Porosity, Karst, Compressibility, Mapping, Discharge (Water).
Identifiers: *Belgium, *Mouscron.

Pumping data recorded during the months of July and August 1956 at a pumping water well of 170 m in depth and drawing water from a Carboniferous limestone of the Mouscron, Belgium area, were analytically investigated on the basis of the simplified Theis-Jacob formula and certain mathematical assumptions. The confined aquifer of the limestone zone of the Roubais-Fourcoing-Mouscron area can be well analyzed by using the classic formulas of underground hydrology. The coefficients of transmissivity and water storage equal to 0.000275 sq m and 0.000103, respectively, computed analytically can be assumed to be acceptable as the mean hydrologic characteristics of the limestone aquifer. Some additional characteristics of the limestone aquifer can be deduced. (Gabriel-USGS)

THE GROUNDWATER SITUATION IN OHIO,
Geological Survey, Columbus, Ohio. Water Resources Div.
Stanley E. Norris.
Ground Water, Vol 7, No 5, p 25-33, Sept-Oct 1969. 9 p, 6 fig, 5 ref.

Descriptors: *Groundwater, *Water resources, *Ohio, Surveys, Hydrologic budget, Water sources, Aquifers, Glacial drift, Limestones, Snadstones, Water storage, Water pollution, Injection wells.
Identifiers: Groundwater resources (Ohio).

Present groundwater use in Ohio, approximately 650 mgd, amounts to about 5% of the water that enters the groundwater reservoirs. The largest groundwater supplies are developed where natural concentrations of water occur, chiefly in the watercourse aquifers, which consist of sand and gravel of glacial origin (outwash) in the valleys of the major streams. Other important aquifers are glacial outwash in upland areas and in the buried Teays Valley system, the limestone and dolomite aquifers in western Ohio, and sandstone and shale aquifers in the eastern half of the State. Future outlook is that more of the increasing water demand will be met from groundwater sources. Groundwater supplies will be developed at many new sites, and aquifers in areas already heavily pumped will be made to yield more water by the drilling of additional wells and recharging the aquifers artificially. Large quantities of groundwater in storage, virtually unexploited, could be used for temporary low-flow augmentation of streams. Management of groundwater resources will be needed to help solve supply and distribution problems, and to resolve conflicts between users. Among future problems will be those arising from underground disposal of wastes, a practice which is expected to grow substantially from enforcement of water-quality standards for streams, set under the Federal Water Quality Act of 1965. (Knapp-USGS)

ANALOG-DIGITAL MODELS OF STREAM-AQUIFER SYSTEMS,
Geological Survey, Denver, Colo.
E. A. Moulder, and C. T. Jenkins.
Ground Water, Vol 7, No 5, p 19-24, Sept-Oct 1969. 6 p, 8 fig, 3 ref.

Descriptors: *Computer models, *Analog models, *Digital computers, *Surface-groundwater relationships, Conjunctive use, Model studies, Simulation analysis, Optimization, Water management (Applied), Streams, Aquifers, Water demand, Water rights.
Identifiers: Hybrid computer models.

The best features of analog and digital computers were combined to make a management model of a stream-aquifer system. The analog model provides a means for synthesizing, verifying, and summarizing aquifer properties; the digital model permits rapid calculation of the effects of water-management practices. Given specific management alternatives, a digital program can be written that will optimize operation plans of stream-aquifer systems. The techniques are demonstrated by application to a study of the Arkansas River valley in southeastern Colorado. (Knapp-USGS)

Identifiers: Groundwater prospecting (Geophysical).

The applicability of geophysical methods to experimental watershed research is demonstrated by a study of a 106-acre forested watershed in central Pennsylvania. Data from a shallow seismic refraction study and an electrical resistivity study of the watershed were used to determine the depth of soils, their volumes, depth to bedrock, configuration of the bedrock surface and delineation of the bedrock surface and of the water table. With this information on the subsurface conditions, the hydrologic properties of the watershed were described in greater detail. This information is of value in explaining the watershed's response to various watershed treatment practices that eventually will be used. (Knapp-USGS)

Identifiers: *USSR, Irkutsk region.

Underground runoff of the Irkutsk amphitheater was investigated on the basis of geological and hydrogeological data recorded at 49 gaging stations located at several rivers and streams of the area. The whole area can be subdivided into 3 basin

groups characterized by their coefficients of underground runoff (underground runoff-precipitation ratio), by their coefficients of underground feeding of rivers, and general drainage, precipitation and wetting. Within the limits of each group the underground runoff reveals close association with precipitation, general runoff and general wetting. The association of the coefficients of underground runoff with the parameters is not clear-cut; however, it is still well identified. (Gabriel-USGS)

COMPACTION AND MIGRATION OF FLUIDS IN MIOCENE MUDSTONE, NAGAOKA PLAIN, JAPAN,
Japan Petroleum Development Corp., Tokyo.
Kinji Magara.
Amer Ass Petrol Geol Bull, Vol 52, No 12, p 2466-2501, Dec 1968. 36 p, 27 fig, 8 tab, 64 ref.

Descriptors: *Groundwater movement, *Compaction, *Consolidation, *Diagenesis, Permeability, Pressure, Earth pressure, Stress, Porosity, Sediments, Sedimentary rocks, Mud, Aquifers, Water sources.
Identifiers: *Japan, Oil migration, Reservoir dynamics.

The main hydrocarbon reservoirs in Nagaoka Plain, Japan, are volcanic and pyroclastic rocks. The migration of hydrocarbons seems to have occurred from adjacent sedimentary source beds to the volcanic reservoirs, facilitated by differential compaction. Therefore, it is possible to determine the directions of the compaction currents by using horizontal porosity distributions of covered mudstone bodies. The differential compaction maps of the mudst one source beds overlying the reservoirs may indicate the directions of hydrocarbon migration, and may suggest the location of hydrocarbon accumulations in Nagaoka Plain. The volumes of the compaction currents are estimated from the vertical porosity distributions and the porosity differences before and after compaction. The resultant figures in connection with the possible hydrocarbon accumulations. There are some abnormal pressures in the reservoirs of the Fujikawa, Kumo. The recent sedimentside, and Mitsuke gas and oil fields in the plain, whereas normal hydrostatic pressures are observed in the reservoirs of such fields as Katagai, Nishi-Nagaoka, and Higashi-Sanjo. This suggests the presence of permeability barriers in the volcanic reservoir rocks. The depths of the volcanic reservoirs and the thicknesses of the sealing mudstone beds are greater at Fujikawa, Kumoide, and Mitsuke, where abnormal pressures are found, than at Katagai, Nishi-Nagaoka, and Higashi-Sanjo, where reservoir pressures are hydrostatic. Therefore abnormal pressures in this district may be ascribed to the thick mudstone selas and overburden pressures. (Knapp-USGS)

ROCK VOLUME AND PORE VOLUME DATA FOR PLAINS REGION OF WESTERN CANADA SEDIMENTARY BASIN BETWEEN LATITUDES 49 AND 60 DEG N,
Research Council of Alberta, Edmonton.
Brian Hitchon.
Amer Ass Petrol Geol Bull, Vol 52, No 12, p 2318-2323, Dec 1968. 6 p, 4 fig, 5 tab, 9 ref.

Descriptors: *Porosity, *Sedimentary rocks, *Groundwater basins, Sandstones, Carbonate rocks, Limestones, Shales, Rock properties, Sedimentary petrology.
Identifiers: Canada, Alberta, Saskatchewan, Western Canada Sedimentary Basin.

Volumes of sandstone, shale, carbonate rocks, and evaporite, and pore volumes within each of these lithologic types, have been computed for 28 stratigraphic units in the plains region of the western Canada sedimentary basin. This region covers 486,785 sq mi and contains a total sedimentary fill of 537, 895 cu mi, with an average depth of 5,834 ft. Tertiary strata comprise 1.3%, Mesozoic strata 45.5%, and Paleozoic strata 53.2% of the total basin sedimentary fill. The average lithologic percentages for the total basin are: sandstone, 11.0; shale, 56.9; carbonate, 26.4; and evaporite, 5.7. The average basin porosity is 11.8%, with more than half the pore volume present in Mesozoic shale beds which comprise only 38% of the total basin fill. The average basin porosity for sandstone, shale, and carbonate is 15.7, 13.9, and 8.2%, respectively. The data are tabulated, with minimum comment, for reference purposes. (Knapp-USGS)

STUDY OF GROUND WATER FLOW IN JOINTED ROCKS AND ITS EFFECTS ON THE STABILITY OF SOLID ROCKS (FRENCH),
Technische Hochschule, Karlsruhe (West Germany).
Claude Louis.
Elec De France, Bull Dir Etud et Rech, Ser A, No 3, p 5-132, 1968. 128 p, 78 fig, 52 ref.

Descriptors: *Groundwater, *Groundwater movement, *Joints (Geology), *Rock mechanics, Discharge (Water), Fissures (Geology), Laminar flow, Turbulent flow, Mathematical studies, Hydraulic properties, Viscosity, Pressure, Tunnel construction, Dam foundations, Soil properties.
Identifiers: Analytical study of groundwater flow.

The phenomenon of flow in jointed media and the stresses transmitted by seeping water to fissured rock are discussed. Systems of plane parallel joints are also investigated because of their existence in the majority of rock massifs. Flows are governed mainly by the geometry of the joint systems if the permeability of rock material, compared to that of the joints, is negligibly small. The factors affecting the geometry of the joint systems are analyzed and flow equations for seepage through open or filled joints are developed by using the principles of theoretical hydraulics and model tests, taking into consideration the form and surface roughness of the joints. Based on this analytical study, graphical and analytical methods for the determination of the potential distribution in joint media are developed. The stresses transmitted by seeping waters consist of shear forces, seepage pressures, and bouyancy. (Gabriel-USGS)

FACTORS AFFECTING INFILTRATION AND RECHARGE IN A LOESS COVERED BASIN,
Idaho Univ., Moscow.
Roy E. Williams, and David W. Allman.
J Hydrol, Vol 8, No 3, p 265-281, Jul 1969. 17 p, 13 fig, 16 ref. OWRR Proj No A-021-IDA.

Descriptors: *Infiltration, *Recharge, *Loess, Surface-groundwat er relationships, Soil water movement, Groundwater movement, Permeability, Anisotropy, Vegetation effects, Soil moisture, Tracers, Washington, Groundwater basins.
Identifiers: Loess recharge.

Hydrographs of shallow piezometers installed in a basin overlain primarily by loess reveal that water infiltrating and percolating through the loess recharges groundwater. Local gravity groundwater flow systems adjacent to some intermittent streams thereby are established. Relief on the water table is at a maximum during late winter or spring but decreases steadily through the summer when dry weather and maximal evapotranspiration minimize recharge. Several factors make the loess more or less susceptible to infiltration and percolation. Among the more important are cultivation practices and type of crop grown. Smooth, heavily worked surfaces (commonly planted in winter wheat) appear to act as a major limitation to infiltration capacity. Soil moisture concomitantly is low beneath such surfaces. Root mats developed beneath grassy surfaces provide optimal conditions for infiltration, and consequently for recharge. Measured infiltration capacities are often influenced by near vertical tabular openings extending to a depth of at least 30 ft in the loess. Tracer studies indicate that when sufficient water is available and when surficial infiltration capacity is sufficiently high to form a zone of positive pressure above these openings, they conduct water ahead of the saturation front. Water moves both downward in the openings and laterally into small rootlet holes in the matrix of the loess. By maximization of surface infiltration capacity it may be possible to utilize the tabular openings to induce groundwater recharge. (Knapp-USGS)

MOISTURE AND ENERGY DISTRIBUTION WITHIN A SLOPING SOIL MASS DUE TO A FINITE DURATION STEADY RAINFALL,
North Carolina Water Resources Research Inst., Raleigh.
Tarit Kumar Sarkar.

University of North Carolina, Ph D Thesis, 1969. 106 p. OWRR Proj A-012-NC.

Descriptors: *Rainfall-runoff relationships, Slopes, Subsurface drainage, Time lag, *Unsaturated flow.

An effort to explain the physics of unsaturated moisture flow problems through an inclined soil mass, a 914 cm long, 76 cm wide, and 12 cm deep, designed and constructed so that it could be tilted at any slope between 0 to 10 percent. The flume was filled to a depth of four feet with mortar sand. A rainfall simulator was designed to create desired rainfall intensities on the top of the flume. Three slopes, zero percent, 1.3 percent and 6.2 percent, were studied with rainfall intensities of .0016 cm/sec for a period of 120 minutes, and .0011 cm/sec for a period of 120 minutes respectively. A computer model was developed to supplement the physical model. In general the observed and calculated moisture contents and pressure distributions agreed within plus or minus 20.0 percent. The agreement between the observed and calculated outflow volumes was very poor with a maximum difference of about-75.0 percent at about 3200 minutes after the start of the rainfall. However, when the outflow volumes were calculated from the observed moisture content distribution, the agreement with the calculated volume was within about -30.0 percent. It is the opinion of the writer that the digital computer is a valuable tool for solving soil moisture flow problems but that the computer model developed in this study needs modification to take care of the fluctuating water table problems. An improvement on the measurement and distribution of the inflow volumes is also required.

INVESTIGATION OF WATER LOSSES TO SINKHOLES IN THE PAHASAPA LIMESTONE AND THEIR RELATION TO RESURGENT SPRINGS, BLACK HILLS, SOUTH DAKOTA,
South Dakota School of Mines and Technology, Rapid City.
John Paul Gries.
So Dakota Water Resources Research Institute Project completion report, Sept 1969. 16 p, 1 fig, 10 ref, 2 append. OWRR Proj A-010-SDAK.

Descriptors: *Sinkholes, Caverns, *Water-loss, *Pahasapa Formation, Limestone, Black Hills, *South Dakota, *Springs.

Streams flowing radially from the Black Hills lose some or all of their water while crossing the outcrop of the Pahasapa (Madison) Limestone. Much is lost to sinkholes in the limestone, but some is temporarily lost to alluvium in the valley bottom. Careful geological examination of the stream channel at various stages of streamflow has located most of the points of water loss and return. Monthly discharge measurements have been made above, below, and between known points of loss on eight of the principal streams for a period of three years. The resultant profiles indicate free exchange between surface flow, flow through the alluvium, and flow through limestone cavern systems. Discharge measurements on resurgent springs indicates that most of the water lost to sinkholes returns to the surface. Temperature studies, and introduction of Rhodamine and fluorescein dye demonstrate that appreciable volumes of water regularly flow through the limestone by routes which are much more direct than the meandering path of the surface streams. They also suggest interdivide migration of water from one drainage basin to another. Observations during periods of high water and continuous flow across the zone of loss show that as the groundwater table rises, the ability of the subterranean passages to transmit water away from the intake area is reduced. Water losses to the sinkholes are consequently reduced until the water table returns to normal.

SOME REDUCTION AND OXIDATION PROCESSES IN THE BLACK SEA,
Akademiya Nauk URSR. Marine Hydrophysics Inst.
B. A. Skopintsev.
Oceanology, Vol 8, No 3, p 328-341, 1968. 14 p, 6 tab, 35 ref. Transl from Okeanologiya, Akad Nauk, SSSR, Vol 8, No 3.

Descriptors: *Saline water, *Saline lakes, *Water chemistry, *Reduction (Chemical), *Sea water, *Oxidation, Biological properties, Bicarbonates, Sulfates, Phosphorus, Phosphates, Nitrogen, Organic matter, Anaerobic conditions, Solubility, Chlorine, Sulfides, Hydrogen sulfide, Magnesium.
Identifiers: *Black Sea.

Reduction and oxidation processes taking place in the Black Sea were investigated on the basis of detailed chemical studies and earlier publications. The quantity of bicarbonate carbon found in deep water does not correspond to the overall amount of reduced sulphur (as sulfite). On the basis of the average ratio of nitrogen to phosphorus in mixed plankton, 1+ can be postulated that the amount of phosphate phosphorus formed in deep water is less than the amount of ammonia nitrogen, and that there is a decrease in mineral nitrogen content near the surface. Probable causes for the phenomena are the existence of anaerobic processes for the decomposition of organic matter, lesser phosphate solubility in deep water, and the occurrence of an intermediate denitrification zone. (Gabriel-USGS)

THERMAL STRATIFICATION IN LAKES: ANALYTICAL AND LABORATORY,
University of Science and Technology, Kumasi (Ghana); and Massachusetts Inst. of Tech., Cambridge. Hydrodynamics Lab.
Jonas M. K. Dake, and Donald R. F. Harleman.
Water Resources Research, Vol 5, No 2, p 484-495, Apr 1969. 8 fig, 1 tab, 20 ref.

Descriptors: *Thermal stratification, *Solar radiation, Lakes, Convective mixing, Heat transfer, Energy budget, Model studies, California.
Identifiers: Turbulent diffusion, Internal radiation, Thermal diffusion, Lake Tahoe, Vertical density, Variations.

Theories are developed for the time dependent vertical temperature distribution in a deep lake during the yearly cycle of solar heating and cooling. A heat flux balance at the water surface, which accounts for back radiation and evaporative heat loss, is formulated as a boundary condition. The linear, second-order heat transfer equation is solved by superposition of solutions for the surface absorbed radiation and the internally absorbed radiation. Analytical solutions are given for three different assumptions regarding the time dependence of the incoming radiation and the surface heat losses. At certain times, the resulting temperature and density distribution in the epilimnion are unstable. Under these conditions convective mixing and turbulent diffusion are accounted for by generating a surface mixed layer of uniform temperature, the depth determined by a thermal energy balance. The theory shows good agreement with field observations of temperature distributions in Lake Tahoe. Experiments are performed using artificial insolation (mercury vapor and infrared lamps) on a laboratory tank. We conclude that it is possible to simulate the development of thermal stratification under laboratory conditions. (Ross-Vanderbilt)

CIRCULATION AND THEMOCLINE DEVELOPMENT IN A ROTATING LAKE MODEL,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
Donald R. F. Harleman, Robert M. Bunker, and James B. Hall.
Univ of Michigan, Great Lakes Research Division, Pub No 11, p 340-356, 1964. 11 fig, 3 ref.

Descriptors: *Currents (Water), *Coriolis force, *Thermal stratification, Winds, Great Lakes, Lake Michigan, Thermocline, Air circulation, Water circulation.

Model studies were made to determine the effects of coriolis force, thermal stratification and surface currents on circulation and thermocline in Lake Michigan during the summer season. Detailed investigations in both static and rotating models were made for two cases: (1) north and south wind components operating together and (2) south wind operating alone; and with: (1) isothermal lake, (2) 40-ft thermocline, and (3) 25-ft thermocline. Conclusions were, for surface currents: (1) Rotation of the lake model produces major changes in the pattern of surface currents, (2) The existence and depth of a thermocline has a definite effect on both the direction and the velocity of surface currents produced by a constant wind source. For temperature stratification, it was noted that (1) Upon the incidence of thermal heating at the lake model surface a thermocline was almost immediately formed, (2) A consistent temperature gradient occurs near the epilimnion zone, and (3) The shape of the clinolimnion zone indicates that temperature distribution may well follow diffusion theory. General conclusions were (1) Modeling of gravitational and coriolis forces is apparently feasible and (2) More data on actual conditions existing in Lake Michigan are required before accurate modeling can be obtained. Edward J. Hickin.
Amer J Sci, Vol 267, No 8, p 999-1010, Oct 1969. 12 p, 4 fig, 4 plate, 8 ref.

Descriptors: *Sedimentation, *Alluvial channels, *Meanders, *Sedimentary structures, Model studies, Hydraulic models, Bank erosion, Stratigraphy, Stream erosion, Channel morphology, Flood plains, Turbulent flow, Supercritical flow.
Identifiers: *Point bars, Point dunes.

Sedimentation on stream bends developed at supercritical flow in a sand bed flume is examined in terms of a five-stage model. The model outlines the process by which deposits on the convex sides of meanders (point dunes) are formed. This mode of deposition, distinctly different from overbank and lateral accretion, also occurred at existing bends of the flume channel when the flow was subcritical and non meandering. Point dunes, which are examples of a feature in dynamic equilibrium, may also occur naturally when streams flowing over coarse noncohesive material are forced to change direction at valley bends. Field evidence, including a pilot mechanical analysis of sediment from a natural point dune, is presented which strongly supports the possibility. The significance and implications of the possible accordance of point dune and flood plain surfaces are discussed briefly. (Knapp-USGS)

Geochem Int, Vol 5, No 2, p 306-313, 1968. 8 p, 3 tab, 28 ref. Transl from Geokhimiya, USSR, No 3, p 323-333, 1968. Published by Geochemical Society.

Descriptors: *Uranium radioisotopes, *Radium radioisotopes, *Surface waters, *Sediments, *Indian Ocean, Sea water, Sampling, Deposition (Sediments), Chemical analysis, Petrology, Seashores, Carbon, Iron, Silica, Calcium carbonate, Titanium, Phosphorus, Organic matter.
Identifiers: Oceanic sediments.

A study has been made of the spatial distribution of uranium and radium in the surface layer of Indian Ocean sediments. Several samples from the central and southern parts of the Ocean were examined. Eighteen of the 50 samples contain radium deposited directly from the water by sorption on the particles and uranium coprecipitates with dead organisms, phosphates, and hydroxides of Fe and Mn. The uranium content of the samples shows that there is no obvious correlation with the type of sediments, depth, or sampling position (distance from shore). (Gabriel-USGS)

SHORE EROSION OF THE NORTHERN CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.; and Johns Hopkins Univ., Baltimore, Md. Dept. of Oceanography.
J. R. Schubel.
Shore and Beach, Vol 36, No 1, p 22-26, Apr 1968. 5 p, 6 fig, 2 ref.

Descriptors: *Erosion, *Sedimentation, *Estuaries, Sediment yield, Provenance, Sediment transport, Deposition (Sediments), Waves (Water), Currents (Water), Sands, Silts, Clays.
Identifiers: *Chesapeake Bay.

The mass of material eroded yearly from the shores of Chesapeake Bay is estimated by combining measurements of areal loss with relief data from topographic maps and field measurements. Cores show that very little eroded sand and gravel escapes the nearshore zone. Silts and clays, which make up 25-53% of the total eroded material, are transported much farther. Total annual shore sediment removal is about 0.3 million tons, of which about 0.1 million tons are silt and clay. River runoff contributes about 5 times this amount yearly, or about 0.20 inches of bay sedimentation per year of a total sedimentation of about 0.24-0.27 inches per year. (Knapp-USGS)
W70-00047

ADSORPTION AND DESORPTION OF RADIONUCLIDES BY SHALLOW-WATER SEDIMENTS OF THE BLACK SEA,
Akademiya Nauk URSR. Inst. of Biology of the Southern Seas.
D. D. Baranova, and G. G. Polikarpov.
Oceanology, Vol 8, No 3, p 341-344, 1968. 4 p, 5 tab, 6 ref. Transl from Okeanologiya, Akad Nauk, SSSR, Vol 8, No 3.

Descriptors: *Sediments, *Shallow water, *Adsorption, *Radioisotopes, Cesium, Silts, Carbonates, Chlorides, Gaging stations, Sampling, Water chemistry, Mussels.
Identifiers: *Black Sea sediments.

Shallow water sediments of the Black Sea were analyzed for the presence of rare elements. Among the sediments studied, the shallow-water silts exhibit a large absorptivity for Sr-90, Zr-95, Ru-106, Cs-137, and Ce-144. Phaseoline silt and aleuritic silt with mussel biocoenosis most effectively absorb Y-91, Zn-95, Cs-137, and Ce-144, but their affinity coefficients for Sr-90 and Ru-106 are low. The high rate or removal of Y-91 and Ce-144 from these silts by 0.2N HCl correlates with the presence of mineral carbonate in the silt. (Gabriel-USGS)
W70-00049

THE USE OF THE SAND-TRANSPORTING PROPERTIES OF WAVES IN LITTORAL DRIFT STUDY,
Akademiya Nauk SSSR. Institut Okeanologii.
M. G. Yurkevich.
Oceanology, Vol 8, No 3, p 352-359, 1968. 8 p, 3 fig, 3 tab, 16 ref.

Descriptors: *Waves (Water), *Littoral drift, *Sands, *Sediment transport, Coasts, Winds, Hydrologic data, Meteorological data, Wind velocity, Energy transfer, Dynamics, Frequency, Statistical methods, Geology.
Identifiers: *USSR, Baltic coast.

Sand transporting properties of waves were analyzed on the basis of hydrometeorological observations recorded at three Baltic coast stations during the 1953-1964 period, and using an energy method. There are large variations in the sand-transporting characteristics when examined over a period of years. In the windiest years all the sand-transport parameters are 3-5 times those of the least windy years. The annual mean values of the sand-transporting parameters indicate that the energy-producing resultant force always lies to the right of the normal and forms an angle with it. (Gabriel-USGS)

THE BALANCE OF SEDIMENTARY MATERIAL IN THE SEA OF AZOV,
Karaganda Polytechnical Inst. (USSR); and Akademiya Nauk SSSR. Institut Okeanologii.
Yu P. Khrustalev, and F. A. Shcherbakov.
Oceanology, Vol 8, No 3, p 360-366, 1968. 7 p, 3 fig, 1 tab, 22 ref. Transl from Okeanologiya, Akad Nauk, SSSR, Vol 8, No 3.

Descriptors: *Sedimentation, *Sediment discharge, River flow, Bottom sediments, Erosion, River basins, Coasts, Abrasion, Dissolved solids, Estuaries, Geology, Silts, Sands, Shoreline cover, Carbonates, Mussels, Suspended load.
Identifiers: *Sea of Azov, *USSR.

Possible sources of sedimentary material in the Sea of Azov were investigated by taking into consideration the discharges of the Don and Kuban Rivers, shore erosion, and bottom erosion of the Sea of Azov. The rivers supply 19 million tons of material into the sea, and the shore erosion and bottom erosion products are estimated to be 17 million tons and 11 million tons, respectively. On the whole, river-derived material plays a significantly smaller role in the sediment balance of the Sea of Azov, than it does in the case of intracontinental water bodies. (Gabriel-USGS)

MASS WASTING IN COASTAL ALASKA,
Forest Service (USDA) Pacific Northwest Forest and Range Experiment Station, Juneau, Alaska.
Douglas N. Swanston.
USDA Forest Serv Res Pap PNW-83, 1969. 15 p, 10 fig, 10 ref.

Descriptors: *Mass wasting, *Landslides, *Slope stability, *Debris avalanches, *Glacial soils, *Colluvium, Sediment yield, Soil erosion, Engineering geology, Soil engineering, Alaska.
Identifiers: Clear cuttings, Logged areas, Debris flows, Debris torrents, Southeast Alaska.

Mass wasting, a dominant form of slope reduction in coastal Alaska, is common where slopes are oversteepened by glacial erosion, soils are recent and shallow, and there is abundant rainfall. Timber harvesting by clear cutting appears to accelerate debris avalanching and debris flows. The most practical current policy to avoid landslide acceleration by timber harvesting is avoidance of slide susceptible areas. Old debris avalanche and flow scars are visible on aerial photos, but a more accurate evaluation of slide susceptibility can be made from a slope gradient map, which can be used to delineate potential slide areas and plan cutting patterns likely to cause the least slope disturbance. (Helmers-Forest Service)

Identifiers: Fluvial sediment measurement.

A description is given of modern techniques and equipment used to plan and make sedimentation measurements on natural streams. First, typical examples are given of sedimentation characteristics such as distribution of sediment with distance above the bed and variation of concentration with time and position in the stream cross section, for the purpose of illustrating some of the problems of sediment measurement. Equipment available is then described for obtaining suspended load concentration, bed load discharge and bed sediment samples. Next, the planning is outlined for making measurements at a cross section to obtain the sediment discharge of a stream and the procedure is presented for making the necessary calculations based on measured data. Finally the method of obtaining long-time records of sediment discharge is considered. This includes the determination of the frequency of making measurements in order to achieve the desired accuracy. The report is intended for the use of engineers not familiar with sediment measurement techniques on streams. (Knapp-USGS)

SEDIMENT MEASUREMENT TECHNIQUES: F. LABORATORY PROCEDURES,
Geological Survey, Washington, D.C.
Harold P. Guy.
Prepared for Task Comm on Prep of Sedimentation Manual, Comm on Sedimentation, Hydraul Div, ASCE. ASCE Proc, J Hydraul Div, Vol 95, No HY5, Pap 6757, p 1515-1543, Sept 1969. 29 p, 7 fig, 5 tab, 21 ref.

Descriptors: *Sediments, *Laboratory tests, *Sampling, Measurement, Particle size, Particle shape, Turbidity, Bed load, Suspended load, Logging (Recording), Instrumentation, Chemical analysis, Sedimentology, Settling velocity.
Identifiers: Sedimentation tubes, Sediment measurement.

A description is given of the technique and apparatus used in laboratory measurements usually made in connection with field sedimentation investigations. The expected and needed accuracy and reliability of measurements is first discussed. The various methods for determining sediment concentration in samples and forms for logging sample and laboratory data are presented. A number of methods for determining particle size and particle size-distribution are then described. These include the visual accumulation tube method and the bottom withdrawal tube method developed in recent years by several U. S. Government agencies as well as classical methods such as sieving and the pipet method. The final section deals with the less common measurement such as determination of the content of organic matter in sediment samples and dissolved solids in the water of the samples. The report is intended for the use of engineers not familiar with laboratory sediment measurements. (Knapp-USGS)

CONTEMPORARY NONMARINE SEDIMENTATION IN SOVIET CENTRAL ASIA,
Tulsa Univ., Okla.
Parke A. Dickey.
Amer Ass Petrol Geol Bull, Vol 52, No 12, p 2396-2421, Dec 1968. 26 p, 10 fig, 11 tab, 76 ref.

Descriptors: *Sedimentation, *Reviews, *Bibliographies, *Sedimentation rates, *Sedimentary basins (Geological), Provenance, Sediment yield, Deposition (Sediments), Geology, Sediment transport, Sediment distribution, Sediment load.
Identifiers: *Soviet Central Asia, Nonmarine sedimentation.

In Soviet central Asia sediments are being deposited in a wide variety of nonmarine environments. This is an area containing large inland seas similar to those that must have been present in the U.S. several times in the geologic past. Many ancient rock units were formed in epicontinental seas under similar conditions. The Caspian Sea is a huge lake of brackish water on whose margins are deltas of rivers, some draining tectonically active and other tectonically stable areas. Sands, muds, carbonates, and evaporites are being deposited in the sea, and their areal patterns can be related both to bathymetry and oceanography. East of the Caspian is a desert, partially covered by recent windblown sand. Rivers from high mountains on the south flow onto the desert, depositing broad areas of fine-grained, fluvial sand and silt. The Aral Sea is a smaller inland lake with two important deltas and a variety of bottom sediments. The recent sediments have been studied by Russian geologists and oceanographers for more than 30 years. Their work is described in several monographs and many technical articles, and a review of their work is presented. (Knapp-USGS)

AUTOMATIC BED DATA ABSTRACTING USING A HYDRAULIC SCALE MODEL (FRENCH),
Department of National Hydrology (France).
J. P. Lepetit, and M. Hariguillie.
Elec De France, Bull Dir Etud et Rech, Ser A, No 3, p 133-148, 1968. 16 p, 11 fig, 3 ref.

Descriptors: *Model studies, *Erosion, *Silting, Charts, Instrumentation, Application equipment, Topography, Bedrock, Transportation, Suspended load, Sedimentation.
Identifiers: Hydraulic scale model.

An automatic streambed charting method using hydraulic model data is described. This method is also suitable for recording changes taking place between two successive surveys of erosion and silting and for calculating the volume of material moved. A bed probe covering the whole model collects the data which are converted to numerical form and transferred to a suitable IBM tape. This tape is processed by a computer after which a microfilm curve plotter generates bed charts giving constant sedimentation and erosion lines. The computer programs and instructions for their use are included. (Gabriel-USGS)

ON THE NATURE OF THE PERIODICITY OF WAVES ON THE SURFACE OF A NONCOHESIVE MEDIUM (A CRITICAL REVIEW OF THE TURBULENCE HYPOTHESIS),
B. A. Shulyak.
Transl from Okeanologiya, Akad Nauk, SSSR, Vol 8, No 6. Oceanology, Vol 8, No 6, p 785-791, 1968. 7 p, 2 fig, 1 tab, 21 ref.

Descriptors: *Sand waves, *Ripple marks, *Sedimentary structures, Currents (Water), Winds, Turbulence, Channel morphology, Model studies, Hydraulic models, Turbulent flow, Vortices, Mathematical studies, Equations, Sands, Silts, Sediments, Sedimentation.
Identifiers: *Waves (Noncohesive media).

The turbulence hypothesis of the formation of periodic waves, including dunes, ripple marks, etc. on the surface of a noncohesive medium is subjected to critical examination. It is shown that observational determinations of the relationship between periodicity and properties of the particles as well as the generation of waves under reverse motion conditions are not compatible with the tur-

bulence hypothesis. A mechanism for the generation of periodicity in wave-induced ripples is advanced. This has been described in previous papers by the author and it has been recently confirmed for ripples in a channel. (Knapp-USGS)

GEOMORPHIC EFFECTS OF FLOODS IN THE ORERE RIVER CATCHMENT, EASTERN HUNUA RANGES,
Auckland Univ. (New Zealand). Dept. of Geography.
C. F. Pain.
J Hydrol, New Zeal, Vol 7, No 2, p 62-74, 1968. 13 p, 4 fig, 1 tab, 24 ref.

Descriptors: *Erosion, *Floods, *Geomorphology, Debris avalanches, Landslides, Mass wasting, Soil erosion, Vegetation effects, Canyons, Cloudbursts, Flood damage, Sediment yield, Slopes, Storms, Topography.
Identifiers: *New Zealand.

The supply of sediment to the channel network and the movement of this material down channel during high-intensity, low-frequency rainstorms is discussed with special reference to the Orere River catchment, New Zealand. Differences in channel form and process in forested and grassed catchments are noted. Under forest, debris flows are important in first-order channels where they remove infill from the channel bed and destroy vegetation beside the channel. Under grass these effects are not so marked. Slope failure under forest contributes vegetation, including large trees, which form debris dams in low-order channels. This rarely occurs under grass. Aggradation behind these obstacles slows down sediment transport, so that under forest the movement of material down channel is intermittent, while under grass it appears to be a relatively steady process. Evidence is presented to show the importance of low-frequency, high-intensity rainstorms as geomorphic factors. These storms cause marked slope failure and a catastrophic increase in debris supply to the channel network. It is suggested that concepts of magnitude and frequency of geomorphic forces need to be modified for areas where slope failure contributes most of the debris to the channel network. (Knapp-USGS)

SEDIMENT RATING CURVES IN EPHEMERAL STREAMS,
Agricultural Research Service, Tucson, Ariz.
Kenneth G. Renard.
Trans Amer Soc Agr Eng, Vol 12, No 1, p 80-85, Jan-Feb 1969. 6 p, 6 fig, 4 tab, 9 ref.

Descriptors: *Ephemeral streams, Hydrology, Sampling, Sediments, Time, *Sedimentation, Arizona, Arid lands, Semiarid land, Suspended sediments, Storms, Runoff, Surface runoff, Watersheds (Basins), Hydrometeorological station, *Sediment production, Gaging stations, *Sediment concentration, Soil erosion, *Stream erosion.
Identifiers: *Sediment rating curves, *Sediment samplers, Multiple regression, *Sediment-water relationship, Walnut Gulch Watershed (Ariz).

A sediment-sampling program was conducted on an ephemeral stream of the Walnut Gulch experimental watershed in Arizona in 1963-1964. Sediment concentration in an ephemeral stream, where runoff is generated from only a portion of the contributing watershed, is related to several independent variables indicative of the flow and hydrologic conditions at the time of the sample. Although a large amount of unanswered variability remains, the multiple-linear-regression technique answers some problems of a sediment-rating curve for semiarid ephemeral streams. Sediment concentration is not predictable using a simple additive equation involving coefficients of the independent variables involved. A better relationship is a multiplicative equation involving products of the independent variables with different exponents. Lapse time from the beginning of flow at the sampling station and the instantaneous discharge at the time of sampling were the 2 most important variables for predicting sediment concentration. Other variables were important in reducing the unexplained variance, but were more inconsistent between the stations considered in the analysis and were important rather for the sand, silt, or clay fractions of the total concentration.

REDUCED SODIUM EXCHANGE CAPACITY IN UNSATURATED FLOW,
Technion - Israel Inst. of Tech., Haifa; and Ministry of Agriculture, Tel Aviv.
R. S. Mokady, and E. Bresler.
Soil Sci Soc Amer Proc, Vol 32, No 4, p 463-467, July-Aug 1968. 5 p, 7 fig, 2 tab, 11 ref.

Descriptors: *Ion exchange, *Soils, *Unsaturated flow, *Aqueous solutions, Electrolytes, Anisotropy, Ion transport, Leaching.
Identifiers: Ion exchange capacity (Soils).

The effective or apparent cation exchange capacity (E.C.) in flow through sandy-soil columns is reduced as the moisture content reduces. From experimental data it can be inferred that unsaturated flow may render the soil anisotropic for ion diffusion. In any case the leaching pattern appears as if some of the sites for ion exchange are not readily accessible under unsaturated flow. (Knapp-USGS)

TRITIUM IN THE EQUATORIAL ATLANTIC CURRENT SYSTEM,
Miami Univ., Fla. Inst. of Marine Sciences.
H. Gote Ostlund, Murice O. Rinkel, and Claes Rooth.
J Geophys Res, Vol 74, No 18, p 4535-4543, Aug 20, 1969. 9 p, 6 fig, 2 tab, 16 ref. NSF Grants GP-1446, GP-3353, GP-5096.

Descriptors: *Tritium, *Atlantic Ocean, *Currents (Water), Sampling, Analytical techniques, Sea water, Salinity, Water temperature, Air circulation, Water transfer, Underflow, Equipment, Instrumentation.
Identifiers: *Equatorial Atlantic current.

This article describes improved sampling and analytical techniques for detection of ultra-low specific activity of tritium in sea water. Tritium data, salinity, and temperature as recorded by the Equalant III expedition of 1964 are presented. Negligible tritium penetration was found below the areal thermocline. Tritium-salinity relations support the concept that molecular exchange constitutes a major portion of the air to sea tritium flux. A time scale of a few years seems reasonable for transfer of distant surface water to the salinity and current cores of the Equatorial Atlantic undercurrent. (Gabriel-USGS)

INTERACTION OF DETRITUS WITH HIGH-MOLECULAR-WEIGHT COMPONENTS OF DISSOLVED ORGANIC MATTER IN SEA WATER,
Akademiya Nauk URSR. Inst. of Biology of the Southern Seas.
K. M. Khaylov, and Z. Z. Finenko.
Oceanology, Vol 8, No 6, p 776-785, 1968. 10 p, 7 fig, 14 ref. Transl from Okeanologiya, Akad Nauk, SSSR, Vol 8, No 6.

Descriptors: *Water chemistry, *Organic matter, *Solutes, *Sediments, *Sea water, Detritus, Chemical reactions, Absorption, Microorganisms, Aquatic microorganisms, Biodegradation, Nutrients.
Identifiers: *Macromolecular organic matter.

The physicochemical (sorption) and biochemical (microorganism-conditioned) interaction of surface-active macromolecular substances, recently

detected in sea water, with natural detritus and with organic matter in suspension are examined. In experiments with microorganism-populated natural detritus, it was shown that enzymatic hydrolysis of sorbed macromolecules takes place at the detritus surface, accompanied by sorption of fresh macromolecules from solution. As a result, a steady flow of material may exist in the 'dissolved marine organic matter - detritus' system. Under experimental conditions, the rate of this flow is about 3% of dissolved sea water macromolecules per day. It is suggested that a definite portion of the dissolved organic matter of sea water is brought into the food chain by consumption of detritus by filtering organisms. (Knapp-USGS)

BIOLOGY AND ECOLOGY OF NITROGEN.
California Univ., Davis.

Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program, National Research Council. National Academy of Sciences, Washington, DC, publisher, 1969. 165 p, 10 fig, 36 tab, 310 ref. Proceedings of Conference California Univ, Davis, 28 Nov-1 Dec 1967.

Descriptors: *Nitrogen, *Nitrogen cycle, *Nitrogen fixation, *Physiological ecology, Nutrients, Nutrient cycling, Plant physiology, Symbiosis, Legumes, Fertilizers, Ecosystems, Crops, Productivity, California, Soils, Tropical regions, Grasslands, Dunes.
Identifiers: Biogeochemistry, Nutrient sources, Food production, Nitrogen balance, Brazil, Chile, Rhizobium, Nitrogen sources (Industrial), Nitrogen sources (Biological).

This report embodies the deliberations of a conference called to establish priorities for research and to consider means to improve coordination of studies in connection with the effect of nitrogen (N) on organisms and their environments, particularly as these relate to global food production. Scope of the technical considerations is indicated by subjects of individual contributions, which have been abstracted separately: biogeochemistry of N; marine N-cycle; symbionts of N-fixing plants; inputs for maximum productivity; significance of N-balances for nitrification; N-storage in California ecosystems; N-economy in grasslands and dunes; effects on soil productivity of N from legumes and crop residues; N-fixation by Chilean rhizobia and their symbiosis with legumes; inoculation of Brazilean legumes; nonsymbiotic N-fixation in tropics; importance of nonsymbiotic organisms in N-economy of tropics; and physiology of Rhizobium-legume symbiosis. In addition to details of technical deliberations, report includes a summary, findings, and recommendations; appendices encompassing a prospectus for comparing biological N-fixation with industrial sources, and a list of participants is also included. (See also W70-00278 thru W70-00290). (Eichhorn-Wisconsin)

THE BIOGEOCHEMISTRY OF NITROGEN,
California Univ., Davis. Dept. of Soils and Plant Nutrition.
C. C. Delwiche.
Biology and Ecology of Nitrogen, p 10-15, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 1 fig. Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967.

Descriptors: *Nitrogen, *Nitrogen fixation, *Nitrogen cycle, *Photosynthesis, Ammonia, Nitrates, Nitrites.
Identifiers: *Biogeochemistry, *Food quality, Nitrogen (Industrial).

A general discussion of biology and ecology of nitrogen, or, more precisely, of the effect of nitrogen on organisms and environment. The report stresses the need for an exact appraisal of the relative potential significance of symbiotic, nonsymbiotic, and industrial nitrogen fixation as related to the industrial application of photosynthetic reactions and the quality of produced crops. (See W70-00277). (Wilde-Wisconsin)
W70-00278

THE NITROGEN CYCLE IN THE SEA,
Washington Univ., Seattle. Dept. of Oceanography.
R. C. Dugdale.
Biology and Ecology of Nitrogen, p 16-18, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program, National Academy of Sciences, Washington, DC, publisher. 9 ref. Proceedings of Coneerence, California Univ, Davis, 28 Nov-1 Dec 1967.

Descriptors: *Nitrogen cycle, *Oceans, *Tropical regions, *Nitrogen fixation, *Kinetics, Phytoplankton, Zooplankton, Turnovers, Cyanophyta, Ureas, Eutrophication.
Identifiers: *Euphotic zone, *Marine deserts, Michaelis-Menton formula, Isotope-dilution measurements, Glycine, Algal blooms.

The use of nitrogen-15 suggested that the bulk of combined nitrogen (N) in deep sea waters is present as nitrate. The active N-cycle is largely confined to the upper layer of several hundred meters. Maximum activity is in the euphotic zone where phytoplankton consumes nitrates and ammonia released by zooplankton and bacteria. Nitrate accounts for 30% of N in productive regions, but for only 1% in 'deserts' of tropical seas. Kinetics for algal uptake of ammonia give estimate for Michaelis-Menton constant, K - 1 microgram-atom N/liter. Turnover time for ammonia in productive surface waters is about 40 hours; that of nitrate, about 50 hours. Combined N is provided by fixation of blue-green algae, particularly by Trichodesmium spp, forming heavy blooms and delivering as much as 0.32 kilogram N/hectare/day. Low oceanic oxygen levels, attaining less than 0.3% saturation, induce substantial denitrification. Uptake of labeled urea and glycine can be demonstrated, and some algae can use a variety of organic N-sources. (See W70-00277). (Wilde-Wisconsin)
W70-00279

NITROGEN-FIXING PLANTS AND THEIR SYMBIONTS,
South Dakota State Univ., Brookings. Dept. of Bacteriology.
R. M. Pengra.
Biology and Ecology of Nitrogen, p 19-24, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program, National Academy of Sciences, Washington, DC, publisher. 14 ref.

Descriptors: *Nitrogen fixation.
Identifiers: *Plants (Nonleguminous), *Symbionts, *Leaf nodules, Phychotria bacteriophila, Klebsiella rubiacearum, Cross-inoculation, Aerobacter, Streptomycete endophytes, Fungal endophytes, Myrica, Alnus, Casuarinales, Ceanothus, Elaegnus, Rhamnus.

The nonleguminous plants capable of utilizing molecular nitrogen (N) include species of Alnus, Myrica, Casuarinales, Ceanothus, Elaegnus, Rhamnus, Hippophae, and Shepherdia. N-fixation in Phychotria bacteriophilia is accomplished by leaf nodules harboring Aerobacter (Klebesiella rubiacearum). Claims have been made that certain pines in association with fungus or fungal endophyte utilize molecular nitrogen. The streptomycete endophyte in the parenchymal cells of roots of Alnus glutinosa is believed to comprise three evolutionary forms: hyphal, vesicular, and bacteroidal. No streptomycete endophyte has been thus far isolated. Cross inoculation has been shown between species of Alnus and the family of Elaegnaceae. In all cases N-fixation required the presence of molybdenum. (See W70-00277). (Wilde-Wisconsin)
W70-00280

INPUTS FOR MAXIMUM PRODUCTIVITY,
California Univ., Davis. Dept. of Agronomy.
R. S. Loomis.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 25-30, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program, National Academy of Sciences, Washington, DC, publisher. 2 fig, 5 ref.

Descriptors: *Nitrogen fixation, *Legumes, *Productivity, Crop response, Cereal crops, Biomass.
Identifiers: *Symbionts, *Nitrogen (Industrial), Photosynthates, Resistance (Nitrogen), Ratios (Nitrogen:Carbon).

Maximizing the production of photosynthate is not always synonymous with optimizing the output. Canopies capable of a rapid photosynthesis must be coupled with plant types whose biomass consists largely of useful products. A key feature of new cereals is their tolerance to an abundance of nitrogen (N). Symbiotic N-fixation is accomplished at the expenditure of photosynthate and involves a direct drain on productivity, particularly pronounced when low-value legumes are rotated with high-value crops. Industrial nitrogen and nonsymbiotic N-fixation do not tax the energy material within the produced crops. (See W70-00277). (Wilde-Wisconsin)
W70-00281

SIGNIFICANCE OF THE NITRIFICATION REACTION IN NITROGEN BALANCES,
Tennesse Valley Authority, Muscle Shoals, Ala.; and Iowa State Univ., Ames. Dept. of Agronomy.
R. D. Hauck, and J. M. Bremner.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 31-39, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 10 ref.

Descriptors: *Nitrification, *Nitrogen cycle, Volatility, Denitrification, Leaching, Fertilizers, Inhibitors, Coatings.
Identifiers: *Nonphytotoxic chemicals, *Nitrogen loss, *Nitrogen retention, Chemodenitrification, 2-chloro-6-pyridine, 'N-serve', Inhibitors (Nitrification), Fertilizers (Organic).

The volatilization, denitrification, and leaching losses of nitrogen (N) are reduced by the use of fertilizers of limited solubility or biological degradation, such as magnesium ammonium phosphate, crotonylidenediurea, isobutyridenediurea, and ureaforms. The same goal is achieved by coating fertilizers with waxes, paraffins, acrylic resins, vinyl acetate, latex, gums, etc. An increase in the recovery of fertilizer N is sought by employing nonphytotoxic nitrification inhibitors, including thiourea, cyanamide, mercapto compounds, pyridine, and triazine derivatives. Studies indicated that 2-chloro-6- (trichloromethyl)-pyridine reduces the leaching and volatilization losses of fertilizer nitrogen. (See W70-00277). (Wilde-Wisconsin)
W70-00282

NITROGEN STORAGE OF SEVERAL CALIFORNIA FOREST SOIL-VEGETATION SYSTEMS,
California Univ., Berkeley. School of Forestry.
Paul J. Zinke.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 40-53, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 1 fig, 4 tab, 7 ref.

Descriptors: *Biomass, *Nitrogen, *California, *Ecosystems, *Forests, Soils, Precipitation.
Identifiers: *Sierra Nevada (California), Chaparral microforest, Ponderosa pine, Douglas fir, Redwoods, Granite, Andesite, Site index, Forest litter.

Storage of nitrogen (N) was determined in chaparral, mixed coniferous, and redwood ecosystems. The relative level of N-enrichment of either soil or plant tissues was influenced by the nature of vegetative cover. Increase in precipitation augmented the N-content of forest ecosystems. The total amount of N ranged from 200 grams/square meter in the chaparral microforest to 2,750 grams/square meter in redwoods. Mixed conifers showed intermediate values. About 11 percent of N of ecosystem occurred in trees of redwood forests. (See W70-00277). (Wilde-Wisconsin)
W70-00283

THE NITROGEN ECONOMY OF GRASSLAND AND DUNE SOILS,
Oak Ridge National Laboratory, Tenn. Radiation Ecology Section; and Colorado State Univ., Fort Collins. Dept. of Agronomy.
Roger Dahlman, Jerry S. Olson, and Kenneth Doxtader.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 54-82, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 3 fig, 9 tab, 59 ref.

Descriptors: *Nitrogen cycle, *Grasslands, *Ecosystems, Prairie soils, Systems analysis, Model studies.
Identifiers: *Shoot-root turnover, Income-loss balances, Steppe soils, Missouri prairie, Dune soils, Meyer's quotient, Lang's quotient, Transeau's quotient.

A preliminary model of nitrogen (N) cycle for a native grassland ecosystem is presented. Available results suggest that an appreciable fraction of nitrogen is returned in available form by the shoot and root turnover. Mineralized nitrogen from these sources is nearly adequate to satisfy the minimum requirements of higher plants. Because evaluations of nitrogen inventory and microbial transformations are incomplete or inadequately estimated, authors conclude that further progress in systems analysis of N-cycle depends upon completion of field studies bearing on transformations. (See W70-00277). (Wilde-Wisconsin)
W70-00284

EFFECTS OF NITROGEN FROM LEGUMES AND CROP RESIDUES ON SOIL PRODUCTIVITY,
California Univ., Davis. Dept. of Agronomy.
W. A. Williams.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 83-89, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 2 tab, 13 ref.

Descriptors: *Nitrogen, *Nitrogen cycle, *Legumes, *Decomposing organics, *Soil structure, Mineralization, Corn (Fields), Cotton, Crops, Fertilization.
Identifiers: *Crop residues, *Decomposition (Aerobic), *Decomposition (Anaerobic), *Soil fertility, Cowpeas, Nitrogen release, Nitrogen immobilization.

The nitrogen content needed for decomposition of straw under anaerobic conditions is about one-third of that required for decomposition of crop residues in aerobic environment (0.54% versus 1.5%). Rice crop residues in flooded soils are apt to release rather than to immobilize nitrogen during decomposition. High-nitrogen residues which decay very rapidly have a short-lived effect on soil structure and are of little benefit to the crop that follows incorporation. (See W70-00277). (Wilde-Wisconsin)
W70-00285

AN INVESTIGATION OF THE NITROGEN-FIXING ABILITY OF NATIVE CHILEAN RHIZOBIA STRAINS AND SOME PROBLEMS RELATED TO THEIR SYMBIOSIS WITH SEVERAL LEGUMES,
Concepcion Univ. (Chile). Departamento de Microbiologia.
Raul Zemelman.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 90-100, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, Publisher. 5 tab, 18 ref.

Descriptors: *Nitrogen fixation, *Legumes, Symbiosis.
Identifiers: *Phosphorus fixation, *Microbial strains, Trifolium pratense, Trifolium subterraneum, Medicago sativa, Chile, Rhizobium meliloti, Rhizobium trifolii.

Greenhouse and field trials revealed no effective native Chilean strains of Rhizobium meliloti in symbiosis with Medicago sativa. More than 30% of the native strains of Rhizobium trifolii were effective with Trifolium pratense and 11.5% with T subterraneum. More than 300 U/phosphorus pentoxide/hectare (unit of application not defined otherwise in report) were needed for establishment of symbiosis in soils having a high capacity for phosphorus fixation. (See W70-00277). (Wilde-Wisconsin)

Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 101-113, 1969. Production Processes Subcommittee (E R Lemon, Chairman) US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 3 fig, 6 tab, 12 ref.

Descriptors: *Legumes, *Fertilizers, Trace elements, Sulfur, Nitrogen, Potassium, Phosphorus, Aluminum, Manganese.
Identifiers: *Brazil, *Rhizobium, *Microbial strains, State of Rio Grande do Sul (Brazil), Toxicity (Aluminum), Toxicity (Manganese).

Authors stress the importance of the selection of suitable strains of Rhizobium for nitrogen-fixation and adjustment of soil fertility by application of lime, nitrogen, phosphorus, sulfur, and trace elements. High content of potassium, as well as toxicity of aluminum and manganese, depress the effect of inoculation. (See W70-00277). (Wilde-Wisconsin)

NONSYMBIOTIC NITROGEN FIXATION IN TROPICAL SOILS,
Johanna Dobereiner.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 114-128, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 8 tab, 25 ref.

Descriptors: *Nitrogen fixation, *Tropical regions, *Soils, Azotobacter, Acid soils, Temperature.
Identifiers: *Nitrogen fixation (Nonsymbiotic), *Beijerinckia, Derxia, Azotobacter paspali, Paspalum notatum, Sugar cane, Acid soils (Tropical), Thermal optima, Carbon sources.

Acid tropical soils harbor at least six nonsymbiotic bacteria which have a capacity of fixing from 12 to 30 milligrams of nitrogen (N) per gram of carbon source. The growth-promoting effect of Beijerinckia indica and Azotobacter paspali was particularly pronounced. The rate of N fixation depended on temperature, A paspali and Derzia spp requiring from 33 to 37 deg C. (See W70-00277). (Wilde-Wisconsin)

IMPORTANCE OF NONSYMBIOTIC ORGANISMS IN THE NITROGEN ECONOMY OF TROPICAL SOILS,
Instituto Agronomico, Campinas (Brazil).
Francisco da Costa Verdade.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of Nitrogen, p 129-152, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 4 tab, 128 ref.

Descriptors: *Nitrogen fixation, *Nitrogen cycle, *Tropical regions, *Soils, Leaching, Erosion, Fertilizers, Rain water.
Identifiers: *Nitrogen fixation (Nonsymbiotic), *Beijerinckia, *Soils (Tropical), Sao Paulo State (Brazil), Climate-nitrogen function, Lateritic (Feralitic) soils, Photochemical fixation of N, Rice, Sugar cane, Grasses, Brazil, Nitrogen (Sources), Nitrogen (Crop removal), Terra roxa soils.

In spite of a prolonged cultivation, certain types of terra roxa soils fail to respond to application of nitrogen (N) fertilizers. The author assumes that the consumption of N by crops is compensated by nonsymbiotic N-fixing organisms. A possibility of inoculation with bacteria of the genus Beijerinckia is suggested as a means of increasing the yield of rice, sugar cane, and grasses. (See W70-00277). (Wilde-Wisconsin)

PHYSIOLOGY OF THE SYMBIOSIS BETWEEN RHIZOBIUM AND LEGUMINOUS PLANTS,
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
Martin Alexander.
Proceedings of Conference, California Univ, Davis, 28 Nov-1 Dec 1967. Biology and Ecology of

Nitrogen, p 153-156, 1969. Production Processes Subcommittee (E R Lemon, Chairman), US Nat Committee for International Biological Program. National Academy of Sciences, Washington, DC, publisher. 10 ref.

Descriptors: *Physiological ecology, *Legumes, Alfalfa.
Identifiers: *Rhizobium, *Antimetabolites, *Coconut water, *Symbiotic specificity, Alpha-picolinic acid, Alpha methylglutamic acid, Saccharomyces carlsbergensis, Inositol, Niacin, Gum-producing strains, Benzene-hexachloride, Seed extracts (Alfalfa), Growth regulators, Nodulation.

Nodulation of excised roots of alfalfa was enhanced by extracts of alfalfa seed. Coconut water exerted a similar effect on excised roots of several legumes. Purification of coconut water on activated charcoal yielded a fraction effective in the nodulation bioassay test. This fraction of 4000-fold purification appears to be effective at concentrations from 1 to 0.1 parts per million and may be considered as a growth hormone or growth regulator. The antimetabolite alphapicolinic acid prevented nodulation of birdsfoot trefoil, but had no effect on the growth of the plant. Benzene hexachloride and alpha-methylglutamic acid inhibited nodulation of excised bean roots, but not the root development. Pyridine-3-sulfonate increased nodulation of bean plants. These effects are reminiscent of the influence of Saccharomyces carlsbergensis. A streptomycin-resistant, phage-sensitive strain of Rhizobium trifolii was able to survive irradiation, but proved to be nonnodulating. (See W70-00277). (Wilde-Wisconsin)

GEOLOGIC AND GEOGRAPHIC CONTROLS UPON THE RATE OF SOLUTE REMOVAL FROM SELECTED COASTAL RIVER BASINS BETWEEN HALF MOON BAY AND DAVENPORT, CALIFORNIA,
Miami Univ., Oxford, Ohio.
A. Dwight Baldwin, Jr.
Proc 3rd Annu Amer Water Resource Conf, Nov 8-10, 1967, San Francisco, Calif, p 548-562, 1967. 15 p, 10 fig, 8 ref.

Descriptors: *Water quality, *Hydrogeology, *California, Aqueous solutions, Water chemistry, Solutes, Provenance, Geology, Runoff, Groundwater movements.
Identifiers: California Coastal drainage basins.

Water samples from 4 coastal streams between Half Moon Bay and Davenport, California, were collected and analyzed to determine the factors governing the rate of solute erosion. Geologic controls upon the dissolved solids content result from the complex petrology and structural geology in this section of the outer Coast Ranges. Between 35 and 40% of the chloride removed yearly enters the basins as fine dust derived from the zone of breaking surf along the coast. In the San Lorenzo watershed, during the water year 1960-61, mean discharge was only 25.8 cfs. Solute load for this water year was 52.5 tons/sq mi/year. During the water year 1958-59, the solute load rose to 515 owing to an increase in mean discharge to 278 cfs. Results of this study indicate that conditions favorable for a rapid rate of solute erosion are those least favorable for a high rate of suspended solid removal. (Knapp-USGS)

DISPERSION IN FRESH WATER PORTIONS OF ESTUARIES,
Drexel Inst. of Tech., Philadelphia, Pa.; and New York Univ., Bronx, N.Y. Dept. of Civil Engineering.
Michael D. Disko, and Erick R. Gidlund.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 563-577, 1967. 15 p, 8 fig, 6 ref.

Descriptors: *Dispersion, *Estuaries, *Fresh water, Currents (Water), Tides, Water level fluctuation, Path of Pollutants, Diffusion, Streamflow, Tidal effects, Mixing.
Identifiers: Estuarine dispersion.

An analysis of an ideal estuary section, using the principles of conservation of mass and momentum together with relationships between velocity and tidal amplitude, results in an equation which predicts the spatial and temporal behavior of the friction velocity. The friction velocity and, hence, the dispersion vary throughout the tidal cycles. Dispersion reaches a maximum value at high or low water slack and decreases as the mean water depth occurs in the estuary. The experimental verification essentially consisted of a series of measurements of the spread of instantaneous injections of fluorescein dye and saline water in order to determine concentration and dispersion patterns in a model estuary. Results from the experimental program show that the average level of dispersion, initially zero at dye injection, gradually rises over a period of two or more cycles until an equilibrium state is reached. Instantaneous dispersion values in the model, however, follow a cyclical pattern predicted by the above analysis of an ideal estuary section. Also, results show that the higher the tidal range or river inflow into the estuary, the larger the dispersion. (Knapp-USGS)

CURRENT SYSTEM IN THE NORTHERN IRISH SEA,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Lab.
J. W. Ramster, and H. W. Hill.
Nature, Vol 224, No 5214, p 59-61, Oct 1969. 3 p, 5 fig, 1 tab, 5 ref.

Descriptors: *Ocean circulation, Ocean currents, Water circulation, Synoptic analysis, Tides, Tidal effects, Oceanography, Tracers, Tracking techniques, Current meters.
Identifiers: *Irish Sea.

Direct measurements were made of the tidal streams in the northern Irish Sea by tracking seabed drifters released near the Isle of Man. A drift toward the south in the center of the area was determined. Current meters were installed by 5 cruises since 1966 and current data obtained are tabulated and mapped. It is suggested that the main deep flow of the Irish Sea is associated with a deep channel in the northwestern part and does not pass east of the Isle of Man as do the surface currents. (Knapp-USGS)

WINTER CIRCULATION IN THE GULF OF ALASKA,
Washington Univ., Seattle. Dept. of Oceanography.
Gunnar I. Roden.
J Geophys Res, Vol 74, No 18, p 4523-4534, Aug 20, 1969. 12 p, 8 fig, 23 ref. ONR Contract 477 (37).

Descriptors: *Water circulation, *Alaska, *Winter, *Estuaries, Seasonal, Thermal stratification, Water temperature, Saline water, Velocity, Mass transfer, Eddies, Atmospheric pressure, Winds, Mathematical studies, Density.
Identifiers: *Gulf of Alaska.

The steady-state winter circulation in the Gulf of Alaska was investigated and related to the main thermohaline features of the Gulf. Vertical stratification consists of three principal layers at depths of 100, 200, and over 200 meters respectively. The total mass transport between the surface and the bottom is about 10 million gr/cm/sec. Counterclockwise eddies are found in the semi-enclosed northern part of the Gulf characterized by its westward water transport. Between latitudes 50 deg and 55 deg N, total transports are predominantly westward and represent return flow from eastward transports further south. In general, the velocity structure with depth often shows a maximum in the halocline, providing a mechanism for the formation of warm and cold water cores which are frequently observed in the Gulf of Alaska. (Gabriel-USGS)

THE CHANNELIZED FLOW OF TURBIDITY CURRENTS WITH APPLICATION TO MONTEREY DEEP-SEA FAN CHANNEL,
Scripps Institution of Oceanography, La Jolla, Calif.
Paul D. Komar.
Work partly supported by Scripps Inst of Oceanography. J Geophys Res, Vol 74, No 18, p 4544-4558, Aug 20, 1969. 15 p, 9 fig, 2 tab, 21 ref. ONR Contract NONR-2216 (23).

Descriptors: *Turbidity currents, *Channel flow, *Estuaries, *California, Coriolis force, Pressure, Velocity, Density, Friction, Canyons, Mathematical studies, Slopes, Pleistocene epoch, Sedimentation rates, Erosion, Sediment discharge.
Identifiers: *Monterey Channel.

Turbidity currents of the Monterey deep-sea channel were investigated analytically and experimentally by using the Chezy equation and setting up an

equation that balances the centrifugal and Coriolis forces against the pressure force that results from the cross-channel surface slope. This balancing equation was utilized for calculation of average velocity curves versus density, the two variables in the equations, and the two principal unknowns of turbidity current flow. The equations were applied to the fathograms of 12 crossings taken along a 100 km stretch of the channel. The channel velocities vary from 600 to 2000 cm/sec under conditions of permissible densities, values comparable to the velocities obtained from ordered sequences of submarine cable breaks. Using velocities deduced from the level height differences, it is found that a reasonable range of Pleistocene slump volumes in the Monterey Canyon is capable of generating channel-full turbidity currents of adequate length and time of passage. Solution of equations under a wide range of sediment discharge rates indicates no substantial erosion of the channel since the Pleistocene. (Gabriel-USGS)

TIDAL MODEL OF NORTHUMBERLAND STRAIT,
Acres (H. G.) and Co. Ltd., Niagara Falls (Ontario).
James E. Cowley.
ASCE Proc, J Hydraul Div, Vol 95, No HY3, Pap 6551, p 827-838, May 1969. 12 p, 13 fig.

Descriptors: *Tidal effects, *Ocean currents, *Water circulation, *Coastal engineering, *Hydraulic models, Water levels, Bridges, Highways.
Identifiers: *Northumberland Strait (Canada), Prince Edward Island (Canada).

A model was made to study the effects of a proposed highway crossing on the tidal circulation of Northumberland Strait between the mainland and Prince Edward Island, Canada. The model represented an area of about 5,000 sq mi. The small model scale and the scale distortion of 100:1 were corrected with empirically derived adjustments. It was concluded that significant changes in tidal levels, tidal currents, and storm surge heights will be avoided if an opening equal to at least 1/3 of the present flow area of the Strait is incorporated in the crossing. Increases in the range of high- and low-tidal levels will be extensive if the Strait is completely closed by a causeway. Experience in operating the model has demonstrated that modern control and measuring systems can accurately reproduce and record tides in a model with a time scale as great as 800. The model was adequate at these scales for investigation of the gross changes in tide impedance which would result from the erection of partial barriers across the Strait. In common with some highly distorted river models, however, the best calibration of this model was achieved by a departure from the theoretical rules for similitude, indicating that a more moderate scale distortion would be required for studies of more subtle phenomena, such as details of long distance circulations or mixing and dispersion of salinity or pollutants. (Knapp-USGS)

THE NEAR-SHORE SHALLOWS OF WESTERN CUBA AND THEIR SEDIMENTS (RUSSIAN),
Akademiya Nauk SSSR. Institut Okeanologii.
V. P. Jenkovich.
Russian original with English summary. Okeanologiya, Moscow, USSR, Akad Nauk, Vol 9, Issue 2, p 256-270, Mar-Apr 1969. 15 p, 8 fig, 19 ref.

Descriptors: *Seashores, *Sediments, *Boreholes, Erosion, Sands, Algae, Calcium carbonate, Silts, Forests, Peat, Tides, Currents (Water), Coral, Runoff, Geomorphology, Mapping, Lagoons, Reef, Topography.
Identifiers: *Cuba, Coastal line of Western Cuba.

The coast of Western Cuba was investigated by using geological, hydrological and borehole data recorded by the Soviet-Cuban expedition of 1965. In many places boreholes revealed surfaces of wind erosion at depths up to 13 meters. The study shows that presence of a certain algae species and some chemically-formed calcium carbonate. Peat layers up to 1 m in thickness are present at the edge of the mangrove forest. Strong tidal currents are responsible for the existence of ridge-like relief in sands and silts of Western Cuba. (Gabriel-USGS)

SOME PECULIARITIES OF THE FORMATION OF TIDAL PHENOMENA IN THE SOUTH CHINA SEA (RUSSIAN),
Meteorological Service of the City of Hanoi (North Vietnam).
Nguyen Ngoc Thuy.
Russian original with English summary. Okeanologiya, Moscow, USSR, Akad Nauk, Vol 9, Issue 2, p 235-249, Mar-Apr 1969. 15 p, 9 fig, 2 tab, 25 ref.

Descriptors: *Tidal waters, *Seashores, *Tides, *Estuaries, Electronic equipment, Hydrologic data, Frequency analysis, Energy equation, Mapping, Gaging stations, Hydrodynamics, Friction, Waves (Water), Velocity, Resonance.
Identifiers: *Tidal phenomena, *South China Sea.

A numerical computation of tidal characteristics of the South China Sea was made by using the Hansen method and an electronic computer (BESM-2M), and disregarding the drag effects. The results of the study were plotted on the maps showing the parameters of tides and tidal currents of the South China Sea. In spite of some shortcomings, the results of the study should be considered as more reliable as compared with the similar results of earlier investigations in the same area. The conditions under which the tidal phenomena of the South China Sea are formed and the reason for the existence of large diurnal tidal components are also discussed on the basis of the analysis of resonance phenomena energy, depth, and other pertinent parameters. Descriptors: *Sediments, *Manganese, *Connate water, Pacific Ocean, California, Iron, Cobalt, Sodium, Diffusion, Oxidation, Reduction (Chemical), Geochemistry, Water chemistry, Oxidation-reduction potential.
Identifiers: *Chemical oceanography, Nickel, Lithium, Enrichment, Nodules (Magnanese), Nodule formation, Deep sea sediments.

Analyses for manganese, nickel, iron, cobalt, sodium, and lithium in the interstitial water of two cores from the California Borderland and six deep-sea cores from the East Pacific Rise showed considerable variation in the concentration of trace elements. Oxidizing near-shore sediments showed marked enrichment in manganese in contrast to sulfide-rich reducing sediments which showed no enrichment when compared to average seawater. Iron and nickel showed the reverse trend. In the deep-sea sediments, concentrations of trace metals were variable, with all except one core showing high enrichments (50-3000 fold) in dissolved manganese, with a maximum concentration of 6.6 parts per million. Nickel and cobalt concentrations followed the same trend, whereas, in near-shore sediments, nickel and iron showed similar patterns; two cores showed 50-fold enrichment in nickel and cobalt. Since concentrations of soluble divalent manganese violated predictions from thermodynamic data, author suggests that solution manganese was present in free as well as in complexed form. Analyses of solid phase of the deep-sea sediments showed manganese to be concentrated in the top layers (0-20 centimeters), apparently supporting the theory of manganese nodule formation in deep-sea sediments by diffusion of manganese from depth to the surface. 03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

BRACKISH WATER PURIFICATION BY BIOLOGICAL FUEL CELL POWERED ELECTRODIALYSIS.
Nebraska Univ., Lincoln.
Wm. A. Scheller, and Carl E. Georgi.
Nebraska Water Resources Research Institute, Technical Completion Report, September 1, 1969. 11 p, 7 tab, 12 ref, append: Biochemical Fuel Cell. OWRR PROJECT No. A-007-NEB.

Descriptors: *Electrodialysis, *Economics, Cost, Brackish, Fresh, Desalination, Nebraska, Water.

Samples obtained from four brackish wells in eastern Nebraska and two NaCl solutions were used in conjunction with a laboratory electrodialysis unit to establish the process parameters necessary for estimating the cost of desalination. Investment and maintenance estimates for a 1000 GPD electrodialysis unit were also obtained. The cost of fresh water (500 ppm total solids) produced from brackish water (980 to 6460 ppm of total solids) was $2.30 to $7.78 per 1000 gallons including a 5 percent cost for investment capital. At a typical rural consumption of 60 gallons per person per day, the above fresh water costs are equivalent to 14 cents to 48 cents per person per day. These figures assume electric power is available at 3.3 cents/kwh, a typical rural Nebraska rate. If the electrodialysis unit were supplied with brackish water from an existing pressurized system and with reduced maintenance costs, the desalinated water costs would be reduced by 57 cents to $1.59 per 1000 gallons, depending on the specific case.

DESALINATION UNDER THE CONDITIONS OF NO WATER DRAINAGE (RUSSIAN),
Tashkent Univ. (USSR).
G. V. Mironicheva.
Akhboroti Izvestiya, Uzbek SSR, Akad Nauk, Issue No 3, p 68-70, 1969. 3 p, 1 ref.

Descriptors: *Leaching, *Saline soils, *Saline water systems, *Drainage water, *Mathematical studies, Soils, Groundwater, Diffusion, Salinity, Porosity, Filtration, Velocity, Water chemistry, Forecasting, Soil chemistry.
Identifiers: Desalination with no drainage.

Desalination of soils with no drainage was investigated by setting and solving a diffusion equation, and using the solution techniques developed by N. N. Verigin, A. Begmatov, and D. F. Shul'gin. Final solutions, obtained by using the Lagrange method, permit the forecasting of salt supply changes in the soil after the end of desalination processes. The analysis of the derived formulas indicates that salt contents increase with depth, and the conclusion is supported by recorded data of soil salinity. (Gabriel-USGS)
W70-00237

CALCULATIONS PERTAINING TO THE DESALINATION OF SALT-CONTAINING FORMATIONS UNDERLAIN BY AN AQUIFER OF GOOD PERMEABILITY (RUSSIAN),
Sredneaziatskii Nauchno-Issledovatelskii Institut Irrigatsii, Tashkent (USSR).
R. V. Savel'yeva, and V. A. Baron.
Akhboroti Izvestiya, Uzbek SSR, Akad Nauk, Issue No 3, p 39-43, 1969. 5 p, 1 fig, 7 ref.

Descriptors: *Leaching, *Groundwater movement, *Soil water movement, *Water quality, *Water chemistry, Mathematical studies, Aquifers, Permeability, Climates, Agricultural engineering, Diffusion, Filtration, Sorption, Streamflow, Porosity, Salinity, Estuaries, Rivers, Fourier analysis, Laplaces equation, Forecasting.
Identifiers: Desalination of salt-bearing formations.

Saline and water regimes of soils and grounds of arid regions were analytically investigated to determine the effects of molecular diffusion, sorption, filtration, thermal diffusion, and pressure. By using the equations given by V. V. Rachniskiy (1964), the Laplace transformations, and the Fourier series, the final equation was derived which by knowing the filtration velocity, determines the mineralization of groundwaters in the area under investigation. By knowing the profile of initial soil salinity, the magnitude of filtration stream, and other parameters (porosity, diffusion, water salinity, overburden thickness), the final formula can be utilized for the forecasting of ground salinity regimes. (Gabriel-USGS)

DESIGN OF CLOUD SEEDING PROGRAM,
North American Weather Consultants, Goleta, Calif.
Robert D. Elliott.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR2, Pap 6600, p 275-284, June 1969. 10 p, 6 fig, 3 tab, 2 ref.

Descriptors: *Cloud seeding, *Weather modification, *Network design, *Meteorological data, *Telemetry, Instrumentation, Statistical methods, Irrigation water, Rainfall, Snow management, Streamflow.
Identifiers: Convection band, Experimental design.

Evaluation of the results of cloud seeding in test projects in mountain areas during the winter season would be speeded by the use of a natural mesoscale unit of observation, the convection band. This creates a requirement for real-time telemetry of observations and remote controlled seeding. The use of the natural sub-unit of a winter storm, the convection band, is illustrated by meteorological examples taken from a design study for a Southern Sierra test program. An examination of historical precipitation data showed that with a reasonable assumption as to seeding effects, this method of testing might show statistically significant results in one year; whereas, the conventional seasonal streamflow comparison would require 26 yr, 13 of them seeded and 13 unseeded. Ultimate operational application of these new concepts is explained. (Knapp-USGS)
W70-00230

3C. Use of Water of Impaired Quality

SEA PLANTS FOR FOOD,
Southampton Univ. (England).
J. E. G. Raymont.
The New Scientist, p 10-11, July 18, 1957. 1 fig.

Descriptors: *Marine plants, *Algae, Chlorination, Sodium compounds, Photosynthesis, Carbon dioxide, Nitrates, Phosphates.
Identifiers: *Phaeodactylum, *Gas effluent, Food production, Southampton University.

A marine algae crop of Phaeodactylum has been experimentally grown but not subjected to thorough chemical analysis which would estimate its food value, or protein produced per nutrient intake. The dry weight of the harvested crop was 1/3 gram per liter culture which was a favorable beginning result. Heat sterilization was the preferred procedure in the filtering and sterilizing steps. A commercial ammonium sulfate was used as fertilizer. Algae growth depended on a strong enough light source and was therefore grown in shallow areas and in the winter by artificial lighting. Carbon dioxide for the photosynthesis was supplied as successfully by effluent waste gases of partially purified waste water as by cylinders. The effluent carbon dioxide is hoped to decrease the need for nitrate and phosphate. (Sherman-Vanderbilt)

ORGANIZATION AND GOVERNMENT OF CITIES-THIRD CLASS.

Ky Rev Stat Ann secs 85.140, 85.150 (1963).

Descriptors: *Kentucky, *Rivers, *Sewers, *Navigation, Legislation, Regulation, Drains, Culverts, River regulation, Docks, Cities, Local governments, Administrative agencies, Taxes, Legal aspects.
Identifiers: Ferries.

The common council, by ordinance, establishes and erects public buildings, public ways, sewers, culverts, and gutters, and promotes and regulates navigation on any navigable river within or adjoin-

ing the city. The council licenses, taxes, and regulates ferries across any river within the limits of the city. It also erects wharves, docks, and landings and regulates stationary anchorage and mooring of vessels and rafts. (Moulder-Florida)

JOINT CONSTRUCTION OF WATER SUPPLY.

Ill Ann Stat ch 24, secs 11-126-1, 11-126-3, 11-126-4 (Smith-Hurd 1962).

Descriptors: *Illinois, *Water works, *Water supply, *Reservoirs, Legislation, Legal aspects, Cities, Construction, Maintenance, Contracts, Condemnation, Streams, Water pollution, Jurisdiction, Regulation, Impounded waters, Water sources, Local governments, Pollution abatement, Water pollution control.

Cities may provide a water supply for fire protection and for use by inhabitants by: (1) construction and maintenance of a waterworks system; (2) joint construction of such a system with an adjacent city; (3) procurement of a supply of water from an adjacent city with an existing waterworks system. There is provision for the letting of contracts for the construction of waterworks systems. Cities may acquire property outside their corporate limits for the purpose of constructing, maintaining, or supplying a system of waterworks; similarly, city jurisdiction is extended ten miles beyond its corporate limits for the purpose of preventing pollution or injury to the source of water for the supply of the waterworks. The authorities of each city may make and enforce rules and regulations necessary in the construction and management of its waterworks system and for the use of water supplied thereby. City authorities may also make and enforce regulations necessary for the improvement, care, and protection from pollution of the city's water supply source. The city may charge its inhabitants for water supplied them from the waterworks system. (Keith-Florida)

SOIL AND WATER CONSERVATION DISTRICTS LAW.
Ill Ann Stat Ch 5, secs 106-138.2 (Smith-Hurd 1966).

Descriptors: *Illinois, *Water policy, *Water resources, *Water resource development, Natural resources, Conservation, Legislation, Regulation, Administration, Management, Administrative agencies, State governments, Water, Water conservation, Flood control, Floodwater, Project planning, Recreation.

The Illinois Soil and Water Conservation Districts Advisory Board is established and its organization, powers and duties are delineated. Regulations pertaining to the creation of soil and water conservation districts including petition, notice, and hearing provisions as well as necessary Department of Agriculture findings and determinations are set forth. The Department determines whether the operation of the proposed district is administratively practical. Provisions for a district governing body are set forth and powers of the various districts and their directors, including development and publication of conservation plans and erosion control measures, acquisition of property, cooperation with individuals and government agencies, and powers of suit, are enumerated. Adoption of land use regulations, district consolidation and division regulations, and regutory provisions for formation of subdistricts and district discontinuance provisions are set forth. CONSERVATION PERUSE PROGRESS THROUGH EXPLOITATION,
California Tomorrow, San Francisco, Calif.
Samuel E. Wood.
In Planning 1968, Selected Papers from the ASPO National Planning Conference, San Francisco, p 270-277, May 4-9, 1968. 8 p.

Descriptors: *Conservation, *Natural resources, Economic impact, Technology, Natural resources, Government, Pricing, Population, Pollution, Rivers, Lakes, Pesticides, Government subsidies, Federal government, State government, Local government.
Identifiers: *Economic development, Capital improvement.

The article is concerned with the apparent dichotomy of conservation and economic development. Much of the blame for the current state of resource destruction is placed on the city and county governments. The author suggests that the relative state, local and federal responsibility for resource conservation needs a review. The author feels all federal grants and capital improvement programs should be conditioned on area-wide planning and administration. The federal government should also encourage the states into assuming more meaningful responsibilities for protecting the environment. In addition, the federal government should realign its various programs to effectuate development of sound urban units and electronic-data processing should be fully enlisted in resource conservation. Since water resources often enter conservation issues and problems, this article has relevance to water research dealing with institutional and governmental relations. (Murphy-Rutgers)

SMITH V SPEERS (CONDEMNATION OF PROPERTY FOR CONSERVATION OF ATLANTIC SEA RUN SALMON).

353 A2d 701-705 (Me 1969).

Descriptors: *Maine, *Atlantic salmon, *Fish conservation, *Condemnation, Judicial decisions, Salmonids, Salmon, Anadromous fish, Commercial fish, Conservation, Wildlife conservation, Legal aspects, Administrative agencies, Administration, Fish, Water conservation, Fish management, Fish migration, Flow control, Flow rates, Dams, Hydroelectric plants.

Defendant Commissioner of Inland Fisheries and Game had certain of plaintiff's property, including two hydroelectric dams, condemned for the public purpose of conserving Atlantic sea run salmon. Plaintiff sought a declaratory judgement to determine the validity of the condemnation order alledging among other things that, while the legislature had provided for the conservation of such fish, it had not specifically provided the Commissioner with the power to condemn property for that purpose. The Supreme Judicial Court of Maine, in declaring the taking void, held that because the legislature had not specifically determined that public exigencies require the taking of certain properties for the purpose of regulating the flow of river water for the protection of salmon, the Commissioner had no power to condemn plaintiff's property, and the taking had no effect as to plaintiff and his title in and to the property purportedly taken. FISH AND WILDLIFE RESOURCES.
Ky Rev Stat Ann secs 150.445-150.991 (1963), as amended, (Supp 1968).

Descriptors: *Kentucky, *Regulation, *Fishing, *Fishing gear, Legislation, Administration, Fish, Rough fish, Minnows, Crayfish, Baits, Electrical shocking gear, Explosives, Fish toxins, Commercial fishing, Sport fishing, Nets, Seines, Recreation, Mussels, Poisons.

Regulations pertaining to the use of commercial and sport fishing gear are set forth. Substances that are injurious to fish and aquatic life are not to be used in fishing. No person may use any electrical device or poison for taking fish. Limits on the number and size of fish taken are delineated. Live bait dealers must obtain a license from the Department of Fish and Wildlife Resources. Musseling operations may be carried on only after a license has been obtained from the Department. Possession of nets such as gill nets, trammel nets, illegal seines, and other nets not authorized by the commissioner is prohibited. Regulations pertaining to the taking of water fowl in the state are provided. Revenue bonds may be issued to establish public lakes, and the Department of Highways is authorized under certain conditions to construct lakes. 'Pay lakes' are defined and pertinent regulations are provided. (Moulder-Florida)

A NEW METHOD OF IRRIGATION,
R. L. McWhorter.
Ga B J, Vol 13, No 1, p 114-116, Aug 1950. 3 p.

Descriptors: *Georgia, *Sprinkler irrigation, *Diversion, *Reasonable use, Irrigation engineering, Legal aspects, Damages, Land tenure, Irrigation, Water utilization, Water conveyance, Water consumption, Water law.
Identifiers: Upper landowner, Lower landowner.

Irrigation, however it is accomplished, is a commercial use, and the riparian proprietor is limited to a reasonable appropriation. In order for a riparian owner in Georgia to irrigate his land and not subject himself to a lawsuit, he must only use a reasonable amount of water and must turn that which is not reasonably used back into the main channel before it passes the land of the proprietor below. With the sprinkler system of irrigation being used more and more it is quite conceivable that the courts will be called upon to rule whether irrigation

is legally the same as diversion. Those who contemplate irrigating their lands should get a written agreement from the person below which in effect grants to the upper proprietor the right to take water in such manner. (Heckerling-Florida)

EFFECT OF TILE DEPTH, SPACING, AND CROPPING PRACTICES ON DRAIN DISCHARGE,
Ohio Agricultural Research and Development Center, Wooster; and Agricultural Research Service, Columbus, Ohio.
J. R. Hoover, and G. O. Schwab.
Trans Amer Soc Agr Eng, Vol 12, No 1, p 150-152, Jan-Feb 1969. 3 p, 3 fig, 6 tab, 6 ref.

Descriptors: Drainage, *Drainage systems, *Tile drainage, Wheat, Oats, *Tile drains, Drain tiles, Rainfall, *Discharge (Water), Agronomy, Corn (Field), Crops, Agriculture, *Dishcarge measurement, Depth, Percolation, Permeability.
Identifiers: *Tile spacing.

A tile drainage experiment to determine relationships between tile flow and cropping practices, drain depth, and drain spacing was conducted in Ohio from 1951 to 1966. Moisture for crops was supplied by rainfall. Narrow (30-ft) drain spacings resulted in a higher tile discharge than the wider (60-ft) spacing. Long-season crops resulted in lower tile discharge than crops growing actively during a small portion of the growing season. Narrow drain spacings and a long-season previous crop result in a lower soil moisture content throughout the year, promoting proper soil moisture conditions for tillage, planting, and harvesting operations. Timeliness of tillage and harvesting are some benefits of good drainage and long-season crops. A measure of the degree of drainage obtained by a tile system is given by the probability of occurrence of tile flow rates. The probabilities of flow during March, April, and May are useful for designing tile systems because these are the months of highest tile discharge and also the months when the seedbed must be prepared for row crops. ON THE DISTRIBUTION OF THE FREQUENCY OF RESERVOIR DEFICIT,
City Univ., London (England). Dept. of Civil Engineering.
C. Venetis.
J Hydrol, Vol 8, No 3, p 341-346, July 1969. 6 p, 1 fig, 1 tab, 5 ref.

Descriptors: *Reservoir operation, *Streamflow forecasting, *Water storage, *Probability, Markov processes, Statistical methods, Mathematical models, Distribution.
Identifiers: Reservoir deficit forecasting.

The distribution of the relative frequency of deficit in N years of reservoir operation is examined, treating the reservoir content as a homogeneous, finite Markov chain. This distribution is conditional on the initial state of the system. It is derived from the m-step transition matrices via the waiting and the recurrence time distributions. The theory is applied to a simple numerical example. (Knapp-USGS)

RIPARIAN RIGHTS - REASONABLE USE THEORY.

Ark L Rev, Vol 19, No 2, p 193-194, Summer 1965. 2 p, 5 ref.

Descriptors: *Arkansas, *Riparian rights, *Reasonable use, *Dams, Judicial decisions, Water levels, Rivers, Land tenure, Land use, Remedies, Damages, Riparian land, Bayous, Drainage, Legal aspects, Relative rights.

Plaintiff and defendant, adjoining landowners, operated hunting and fishing enterprises. Defendant constructed three dams which prevented the normal drainage of a bayou onto plaintiff's land. Water entered the bayou from a nearby river when the river reached seventeen feet. However, due to one of the dams, water did enter until the river reached nineteen feet. Plaintiff brought a bill in equity seeking removal of the dam and damages. The chancery court directed removal or lowering of the dam but denied damages. On appeal, defendant was allowed to lower two of the dams. Under these circumstances when one lawful use of water interferes with or detracts from another, an equitable adjustment must be made. The present case clearly commits Arkansas to the reasonable use theory in deciding conflicts of interest between riparian owners. However, because of a paucity of decisions, the court's development of the theory is not extensive. The court in the principal case stated that it would not necessarily adopt all the refinements given the reasonable use theory by decisions of other states and that its interpretations would be developed as occasions arise. (Heckerling-Florida)

NAVIGATIONAL SERVITUDE: AN OLD CONCEPT WITH A NEW LIMITATION,
Robert D. Stein.
Buffalo L Rev, Vol 11, No 2, p 417-423, Winter 1962. 7 p, 43 ref.

Descriptors: *Navigation, *Federal government, *Eminent domain, *Compensation, Judicial decisions, High water mark, Condemnation, Easements, Interstate rivers, Power operation and maintenance, Riparian land, Riparian rights, Value, Land tenure, Land use, Non-navigable waters, United States, Legal aspects.
Identifiers: *Navigational servitudes, *Commerce, *Non-riparian uses, Fast lands.

Under the commerce clause of the Constitution, the federal government has the power of navigational servitude which allows the government to control the navigability of an interstate waterway by regulating its flow. The power of navigational servitude is not a new concept and stems from the early case law giving the government the right to control interstate navigable waterways. There are, however, limitations on the power. It can only be exercised over lands below the high water mark of the stream. If the government takes fast lands or a non-navigable stream, it must use its power of eminent domain and pay the owner just compensation. Recent decisions limit the power under the servitude to the high water water mark. In United States v Virginia Electric and Power Company, 350 U.S. 956 (1956), the government attempted to extend the power of navigational servitude to acquire a flowage easement held by the power company over fast land adjoining a navigable river. The Supreme Court adopted a formula which values the non-riparian uses of the land and then adds a probability factor, the probability of the easement's exercise, to apportion the damages between the fee owners and the easement owner. This case will undoubtedly have a limiting effect on the power of navigational servitude since the court allowed the power company payment for the value of the non-riparian uses of the land, but did not allow the company to be recompensed for the riparian value of the easement. (Heckerling-Florida)
W70-00084

ACCESS BY THE PUBLIC TO A PRIVATE BODY OF WATER FOR RECREATIONAL PURPOSES.

Minn L Rev, Vol 38, p 685-689, 1954. 5 p, 23 ref.

Descriptors: *Minnesota, *Recreation, *Public rights, *Condemnation, Bodies of water, Judicial decisions, Land tenure, Lakes, State governments, Public benefits, Legal aspects, Navigable waters, Prescriptive rights, Hunting, Fishing, Riparian land, Legislation, Land use.
Identifiers: Dedication, Estoppel.

The state of Minnesota petitioned for condemnation of a tract of land adjoining a lake, proceeding under a statute which allowed the state to acquire parking or camping areas adjacent to public waters. The owner of the riparian land contended the lake was not a public body of water. The trial court dismissed the petition and on appeal the dismissal was affirmed. Under Minnesota law, whether or not a body of water is public depends on whether it was navigable when Minnesota entered the Union in 1858. In this case the court indicated that the public might be able to acquire the right to hunt and fish through dedication or possibly through prescription or estoppel even though the lake was not navigable at the time of admission of Minnesota to the Union. Dedication can be implied from certain actions by the owner; however, the cases indicate that the right to hunt or fish cannot be acquired by dedication. Early decisions do not recognize a public right to acquire an interest in realty through prescription. Most jurisdictions now hold that acquiescence by an owner for a period equal to the statute of limitations creates a presumption of either prior dedication or prior condemnation. No decisions have been found which even consider the estoppel aspects of the public right to hunt or fish. The best solution would be a statutory enactment providing that after a period of use by the public, an easement will be presumed to have been dedicated to the public for hunting and fishing. (Heckerling-Florida)
W70-00089

EMINENT DOMAIN - WATERS AND WATERCOURSE'S INTERFERENCE WITH DRAINAGE FROM LAND ON NON-NAVIGABLE TRIBUTARY CAUSED BY GOVERNMENT DAM ON NAVIGABLE RIVER HELD COMPENSABLE UNDER FIFTH AMENDMENT.

Harv L Rev, Vol 61, No 5, p 882-884, May 1948. 3 p.

Descriptors: *Eminent domain, *Drainage, *Compensation, *Navigable waters, Non-navigable waters, Judicial decisions, Dams, Federal government, Damages, Rivers, Tributaries, Construction, Condemnation, Mississippi River, Legal aspects.

Plaintiff's use of his land for farming depended on the drainage of surface and underground waters into a non-navigable stream which emptied into the Mississippi River about a mile below plaintiff's farm. Construction of a dam on the Mississippi by the United States raised the normal water level of the tributary, preventing drainage from plaintiff's land. Plaintiff sued in the Court of Claims on the theory of an implied promise by the United States to pay for private property taken for public use without formal condemnation proceedings. The court held that the injury to plaintiff's land was compensable under the eminent domain clause of the Fifth Amendment. Actions like this must be brought under the Fifth Amendment to recover for the 'taking' of property since the government's sovereign immunity prevents suit in tort. In defining a 'taking,' the courts have been influenced by conflicting desires. On one side there is the feeling that public funds should respond for injuries to individuals by public agencies; on the other side, the courts have tried to avoid discouraging public improvements by burdening them with unpredictable and illimitable liabilities. PROTECTION OF LAKES.
Ind Ann Stat secs 27-601 thru 27-659 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Water management (Applied), *Water levels, *Drainage systems, Water loss, Water level fluctuations, Drainage practices, Dams, Dam construction, Lakes, Riparian rights, Riparian water loss, Lake shores, Water pollution, Construction costs, Fresh water, Assessments, Legislation, Legal aspects, Artificial watercourses.
Identifiers: Penalties (Civil).

The protection of water levels of public fresh-water lakes includes restrictions on unauthorized drainage works, dam and levee construction, and interference with fresh-water outlets and spillways of any lake. The application of this act is restricted to natural and artificial fresh-water lakes. The Department of Conservation is given authority for strict control over all drainage works, lake water level stabilization improvements, and sewage disposal facilities. Procedures are available to lake shore land owners, counties, and the Department to petition the courts for leave to make lake and drainage improvements, the costs of which are to be ultimately assessed against the respective petitioners. (See also W70-00124 thru W70-00127). (McDonough-Florida)
W70-00123

WATER LEVEL PROTECTION.

Ind Ann Stat secs 27-601 thru 27-619 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Water management (Applied), *Water levels, *Drainage systems, Dams, Dam construction, Drainage practices, Levees, Bank protection, Lakes, Flood control, Water loss, Riparian rights, Ditches, Spillways, Fresh water, Lake Michigan, Legislation, Legal aspects.
Identifiers: Injunctions (Prohibitory), Penalties (Civil).

The Department of Conservation must approve any drainage works or change or destruction of any bank, dam, or levee that would change the water level of a public fresh-water lake. The construction of any drainage works within one hundred sixty rods of any fresh-water lake is restricted unless a dam is constructed to protect the water level of the lake. It is unlawful to lower more than twelve inches the level of any lake having more than twenty acres. This act does not apply to city water reservoirs, electrical generator water supplies, or to the waters of Lake Michigan. The Department may employ injunctive relief to restrain unauthorized construction or drainage. Violations of this act are a misdemeanor. (See W70-00123). (McDonough-Florida)
W70-00124

WATER LEVEL PROTECTION.

Ind Ann Stat secs 27-620 thru 27-628 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Water management (Applied), *Water level, *Lake shores, Water pollution, Sewage, Excavation, Drainage, Drainage systems, Dams, Spillways, Flood protection, Landfills, Land forming, Lakes, Ditches, Legislation, Legal aspects, Administrative agencies, Regulation, Construction.
Identifiers: Injunctions (Prohibitory).

The Department of Conservation may prohibit the commencement of any project on any public freshwater lake that will affect or is likely to affect a lowering of the water level. Written approval from the Department must be obtained prior to the encroachment on the lake level or shoreline by excavating, filling in, or otherwise changing the size or contour of a lake. The State Board of Health and/or the Stream Pollution Control Board must give written approval for the construction of sewage disposal facilities for housing developments of five or more lots where such a development is a part of any change in shoreline. The Department shall establish the average normal water level of all lakes, erect appropriate monuments designating the normal average water level, and sponsor the construction of dams, spillways, and control works necessary to maintain that level. The natural resources and scenic beauty of Indiana lakes is a public right. Both citizens and the Department may seek injunctive relief to restrain violations of this act. (See W70-00123). (McDonough-Florida)
W70-00125

WATER LEVEL STABILIZATION.

Ind Ann Stat secs 27-629 thru 27-645 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Riparian rights, *Water levels, *Water management (Applied), Riparian water loss, Construction costs, Costs, Assessments, Lakes, Dams, Bids, Water level fluctuations, Drainage, Drainage systems, Water loss, Legislation, Legal aspects, Administrative agencies, Surveys.
Identifiers: Public need.

When at least twenty percent of owners of land abutting upon or within four hundred forty yards of the shore or water line of any lake of ten or more acres, or when the Department of Conservation or board of commissioners of any county in which the lake is located desire to stabilize or raise the lake level, they may petition the appropriate court. The form and content of the petition must follow the requirements of law and allege a public need. If the petition is granted, a surveyor is hired to supervise the improvement and determine appropriate assessments for the costs of the improvement. Objection to the petition or the assessments must be timely filed. Costs and expenses of the improvement shall come out of the county general fund or the general lake improvement fund. (See W70-00123). (McDonough-Florida)
W70-00126

WATER LEVEL PROTECTION (LAKES).

Ind Ann Stat secs 27-646 thru 27-659 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Construction costs, *Drainage systems, *Water levels, Legal aspects, Dam construction, Ditches, Landfills, Land forming, Costs, Riparian rights, Lake shores, Administration, Lakes, Lake Michigan, Assessments, Accretion (Legal aspects), Legislation, Administrative agencies.
Identifiers: Penalties (Civil).

Each county may establish a general lake improvement fund. The surveyor in charge of a lake improvement project must compute the costs of the project, apportion the costs against the land benefited, establish a time for payment of assessment, and publish notice of assessments as liens on the land. Failure of the surveyor to faithfully discharge his duties is a misdemeanor. Petitions for the construction of drainage works within the proscribed distance of a lake may ask that abutting landowners, the Department of Conservation, or the appropriate county participate in the costs of the project. No accretional rights accrue to riparian owners by the lowering of any lake water level by drainage or by extending the shoreline out into the water by filling without the written approval of the Department. The State Board of Health must approve all proposed sewage disposal facilities. Lake Michigan is not affected by this act. (See W70-00123) (McDonough-Florida)

ARMSTRONG V FRANCIS CORPORATION (REPULSION OF SURPLUS WATER).

20 NJ 320, 120 A2d 4-10 (1955).

Descriptors: *New Jersey, *Repulsion (Legal aspects), *Drainage water, *Reasonable use, Judicial decisions, Riddance (Legal aspects), Surface runoff, Surface waters, Floods, Streamflow, Riparian rights, Percolating water, Natural flow doctrine, Erosion, Flood damage, Diversion, Relative rights, Alteration of flow, Flow augmentation.
Identifiers: Civil law rule.

Plaintiff owned land downstream from defendant. Defendant land developer and contractor caused surface and percolating waters from the developed land to be artificially gathered and discharged into the natural stream. The increase in water flow and the deposit of silt from the greater water volume damaged plaintiff's property. Plaintiff brought an action to compel defendant to pipe this water to a discharge lake below his property. Three rules of liability for the casting of surplus surface water onto the land of another have developed: (1) the common enemy rule allows the landowner unrestricted privilege to rid his land of water; (2) the civil law rule imposes liability on anyone who interferes with the natural flow of water so as to cause damage; (3) the reasonable use rule allows the landowner to make reasonable use of his land even though the flow is altered and causes some harm. The court adopted the last rule and found that the defendant's use of his land was unreasonable when weighed against the harm to plaintiff's property. Defendant was held liable for damages. (Helwig-Florida)

ACCRETION - A NEW SLANT,
Warren M. Salomon.
U Miami L Rev, Vol 17, No 3, p 417-420, Spring 1963. 4 p, 17 ref.

Descriptors: *Florida, *Accretion (Legal aspects), *Land tenure, *Access routes, Judicial decisions, Legal aspects, Beds under water, Gulf of Mexico, Shores, Islands, Boundaries (property), Riparian land, Ownership of beds.

In Ford v.Turner, 142 So 2d 335 (2d D.C.A. Fla. 1962), plaintiff and defendant were owners of adjacent tracts of land on the Gulf of Mexico. The lands were separated by a channel. Over a period of years, plaintiff's land had increased in size, growing out into the Gulf over sovereign land until it extended in front of, but did not touch, defendant's land. The result was that defendant's land was almost completely blocked from the Gulf. The court held that accretions belong to the land to which they are joined, regardless of the fact that they also extend in front of other lands. The law as regards accretions has been settled for a long time. Most courts hold that accretions belong to the owner against whose land they form. Division of accretions is done with an attempt to: (1) keep the same proportional share in the new land that the parties had in the old, and (2) allow each party to retain his access to the water. The court must necessarily give due consideration to the correlative rights of adjoining upland owners. The court in the instant case applied rules of law formerly used only in determining ownership of accretions in rivers, not along the seashore. If the court is correct, ingress and egress rights will now be determined by ownership of the submerged land. (Heckerling-Florida)

TREATIES AND RIGHTS OF TRANSIT ON THE ST LAWRENCE,
H. J. Lawford.
The Canadian Bar Review, Vol 39, No 4, p 577-602, Dec 1961. 26 p, 89 ref.

Descriptors: *Treaties, *International law, *Navigation, *St Lawrence River, St Lawrence Seaway, Great Lakes, Canals, Fishing, Commercial fishing, Transportation, Tariffs, Navigable waters, Navigable rivers, International waters, Legislation, Legal aspects.

Recent announcements indicate that the Canadian government intends to restrict the Great Lakes and St Lawrence coasting trade to vessels of Canadian registry. Current legislation also requires compulsory pilotage on these waters. Such policy statements must be considered in light of Canadian treaty obligations containing national treatment clauses, most-favored nation clauses, and direct grants of navigation and cabotage rights. Treaty provisions concerning freedom of transit on the St Lawrence and Canadian canals and coastal fishing will be seriously impaired if Canada does not intend to respect her international committments. (McDonough-Florida)

EXTENT OF PRIVATE RIGHTS IN NON-NAVIGABLE LAKES,
J. W. Cullis.
U Fla L Rev, Vol 5, No 2, p 166-179, Summer 1962. 14 p, 67 ref.

Descriptors: *Florida, *Riparian rights, *Lakes, *Ownership of beds, Nonnavigable waters, Judicial decisions, Federal government, State governments, Legal aspects, Beds under water, Land tenure, Water users, Public lands, Grants, Navigable waters, Riparian land, Overlying proprietor, Relative rights, Riparian waters, Water utilization.
Identifiers: Common law, Civil law.

With the discovery of oil deposits, title to subaqueous property is growing in importance to landowners whose property borders on lakes. In Florida any determination of the rights to waters or submerged lands depends on the question of navigability. If a lake is 'navigable' under the federal definition of the term, then the bed of the lake is held to have passed to the state on its admission to the Union and the state holds the bed in public trust. If a lake is nonnavigable, the bed may pass freely to private owners. Where land bordering a nonnavigable lake is deeded by the state or federal government, state law determines whether the grant carries title out to the center of the lake. The Florida courts will probably follow the majority view and permit private ownership of submerged land to the center of the lake. As yet the Florida courts have not determined the extent to which a bed owner has the right to use the lake overlying his land. Under the common law he may use only immediately overlying his fee; however, under the civil law approach he may use the entire surface of the lake as long as he does not unduly interfere with the rights of the other proprietors. When the question does arise before the Florida courts, adoption of the civil law view will best serve the interests of Florida. (Heckerling-Florida)

RIPARIAN RIGHTS IN GEORGIA,
William H. Agnor.
Ga B J, Vol 18, No 4, p 401-414, May 1956. 14 p, 54 ref.

Descriptors: *Georgia, *Riparian rights, *Reasonable use, *Non-navigable waters, Prior appropriation, Natural flow doctrine, Alteration of flow, Competing uses, Diversion, Industrial water, Irrigation, Irrigation water, Legal aspects, Municipal water, Natural use, Obstruction to flow, Riparian waters, Water pollution, Legislation, Water policy, Permits, Relative rights.

This consideration of the present status of the law regarding riparian rights in non-navigable streams is based on a review of all of the case and statutory material in Georgia. Emphasis is placed on the right of riparian owners to use the water of streams. Generally, each riparian owner is entitled to a reasonable use of such water so long as this use does not adversely affect the natural course of the stream or the rights of other riparian owners. The varying circumstances in each case are used to determine what use is reasonable. Three theories of water law are discussed: (1) the doctrine of riparian rights; (2) the doctrine of prior appropriation; and (3) reasonable use. Each of these theories has its strengths and weaknesses in relation to the three pressing problems of water law. They are: (1) pollution; (2) use of water for irrigation; and (3) use of water by industry and municipalities. The author believes that the present doctrine of riparian rights in Georgia can be adequately modified to meet these problems and makes basic suggestions as to how this can be accomplished. (Schram-Florida)

NAVIGABLE WATERWAYS.
Ind Ann Stat secs 68-101 thru 68-109 (1961).

Descriptors: *Indiana, *Streams, *Navigation, *Obstruction to flow, Legislation, Legal aspects, Administrative agencies, Riparian rights, Beds, Piers, Docks, Mills, Dams, Aqueducts, Bridges, Barriers, Public benefits, Navigable waters, Navigable rivers, Surface waters, Riparian waters.
Identifiers: *Navigable watercourses, Penalties (Criminal).

Boards of county commissioners may declare any watercourse within their county a navigable watercourse upon petition of twenty-four freeholders. When a petition is made, the commissioners will have the watercourse examined to ascertain whether the watercourse is navigable and of public utility; if so, the watercourse is declared navigable. Twice yearly navigable watercourses are cleared of obstructions under the supervision of the road district supervisor for the district in which the stream is located. Penalties are provided for the obstruction of navigable watercourses. Riparian owners may build structures into navigable watercourses, but not so far out as to obstruct navigation. Mills, dams, aqueducts, viaducts, bridges, and machinery on watercourses will not be affected by designation of the watercourse as navigable. Persons living on or owning property along any watercourse that is navigable for large boats are authorized to hang gates at or near the top of the bank, or across any road leading down the bank and terminating at such watercourse, except within the limits of towns and cities. The Kankakee River is declared a navigable stream. (Keith-Florida)
W70-00191

CHICAGO REGIONAL PORT COMMISSION.

Ind Ann Stat secs 68-301 thru 68-305 (1961).

Descriptors: *Port authorities, *Lake Michigan, *Indiana, *Illinois, Interstate commissions, Great Lakes region, Multiple-purpose projects, Resource development, Navigation, Optimum development plans, Feasibility studies, Transportation, State governments, Programs, Harbors.
Identifiers: Chicago.

The Chicago regional port commission was established to investigate and report upon the feasibility of establishing a permanent interstate port authority within the metropolitan district embraced by the Lake Michigan shore line, with recommendations as to membership of the governing body, proposed method of appointment, duties and powers, jurisdiction, and probable expenses involved in maintenance of such port authority. In addition, the commission was given the authority to study, prepare information, and make recommendations with the ultimate goal of bringing into existence a full development of said district's water transportation facilities so as to lead to a revival of said district as a center of water transportation in realization of the natural advantages of this community. Fifteen thousand dollars was appropriated to pay expenses incurred by the commission. This was to be used to pay the actual expenses of the commissioners and pay for the employment of necessary engineering, legal, and clerical assistants. This act was to take force only upon the passage of equal appropriations by the state of Illinois. (Schram-Florida)
W70-00192

PORT AUTHORITIES.

Ind Ann Stat secs 68-1001 thru 68-1020 (1961), as amended, (Supp 1968).

Descriptors: *Indiana, *Port authorities, *Construction, *Channel improvement, Lakes, Harbors, Construction costs, Bulkheads, Transportation, Inland waterways, Financing, Costs, Taxes, Eminent domain, Right-of-way, Contracts, Bids, Legal aspects, Water law, Legislation, Local governments, Cities, Navigation, Planning, St. Lawrence Seaway.

This is an emergency measure to permit the prompt organization of port authorities to take advantage of the St. Lawrence Seaway project. Municipalities, counties, or both may create port authorities having jurisdiction in all territories of the creating subdivision. Prior to the taking of any municipality's property, a county seeking to create a port authority must compensate the municipality in full in an amount equal to the waterfront investments of such municipality. The port authority is governed by a board of directors. The powers of the port authority include the power to: (1) purchase, construct, sell, lease, and operate docks, warehouses, and other port facilities; (2) improve channels, rivers, and streams necessary to the port; (3) acquire real or personal property; (4) recommend the issuing of revenue bonds to cover costs; (5) sell, lease, or contract for natural or mineral resources of land owned by the port authority; and (6) exercise the rights of eminent domain, right-of-way, easements, and others. The construction and use of port facilities by private enterprise is encouraged. A channel maintenance fund financed by ad valorem taxes of real and personal property may be established upon the approval of the State Tax Commission. (McDonough-Florida)
W70-00194

DAMS AND OBSTRUCTIONS - PROTECTION OF FISH.
Ind Ann Stat secs 11-11-1 thru 11-1112 (1956).

Descriptors: *Indiana, *Dams, *Obstruction to flow, *Fish conservation, Legislation, Legal aspects, Rivers, Streams, Ponds, Reservoirs, Lakes, Fish stocking, Fishing, Cities, Impounded waters, Canals, Outlets, Investigations, Administrative agencies, Regulation, Illinois, Ohio River, Weirs, Nets, Pumps, Lake Michigan, Flow control, Flow, Administration, Fish, Fish management, Water policy, Water conservation.

Identifiers. *Public use, *Natural waterbodies, Penalties (Criminal), Wabash River.

Any person owning, operating or controlling any dam or other obstruction across any watercourse in the state must permit a flow of water through same sufficient to maintain fish in the watercourse below such dam or other obstruction; such persons must also keep a sufficient amount of water in the pond, reservoir, or lake above such dam or other obstruction to maintain fish. The provisions of this act do not apply to water impounded for municipal uses or to the Ohio and specified portions of the Wabash Rivers. Persons violating this act are subject to criminal penalties. It is the duty of the Conservation Department to make appropriate investigations persuant to their power to enforce and administer the provisions of this act. The conservation department may construct and maintain weirs and nets in natural bodies of water to insure that game fish liberated therein will not escape to water not open to the public for fishing. All pumps and machinery used to pump water out of Lake Michigan must be designed so as to prevent the killing of fish. (Keith-Florida)
W70-00195

LEVEE AUTHORITY DISTRICTS.

Ind Ann Stat secs 27-1001 thru 27-1033 (1960).

Descriptors: *Indiana, *Flood control, *Administrative agencies, *Levees, Flood protection, Water control, Drainage districts, Drainage, Local governments, Planning, Financing, Construction, Eminent domain, Legal aspects, Dams, Ditches, Easements, Legislation, Taxes, Dikes.
Identifiers: Penalties (Criminal).

Cities within counties of a specified population range may establish Levee Authority Districts for the purpose of acquiring land and easements upon which to construct, improve, maintain, and regulate levees. Each Levee Authority District is governed by a board having executive and legislative powers for the District. Board members may not hold appointive office, be employed by the District, or have an interest in any contract with or claim against the district. The board may: (1) propose and adopt ordinances; (2) sue and be sued; (3) adopt an annual budget and levy taxes; (4) incur debts; (5) adopt rules and regulations; (6) acquire realty and personalty; (7) sell any unneeded property; (8) construct, maintain and repair levees, dikes, break waters, pumping stations, flood gages, sewers, ditches, and diversion channels as necessary; (9) enter into contracts; (10) exercise the power of eminent domain; and (11) issue general obligation bonds of the district. The construction and operation of levees under this act is declared to be a governmental function of general public necessity. Violations of this act or of regulations and ordinances enacted pursuant thereto are misdemeanor. (McDonough-Florida)
W70-00197

FLOOD CONTROL SYSTEMS.

Ky Rev Stat Ann secs 104.200-104.380 (1963).

Descriptors: *Kentucky, *Financing, *Flood control, *Cities, Costs, Legislation, Regulation, Administration, Flood protection, Dams, Drains, Dikes, Levees, Water control, Diversion structures, Control structures, Economic feasibility.

All fourth class cities may establish a flood control system. The city may acquire necessary land within or without the city by gift, purchase, or condemnation. The city may secure funds by the issuance of bonds payable from the proceeds of an annual property tax and from special assessments. The method of establishing the system, including resolutions, hearings, objections or protests, and adoption of the final ordinance setting up the system is set forth. The system may be constructed by contract or by the city itself. (Moulder-Florida)

DRAINAGE IMPROVEMENT DISTRICTS; REMOVAL OF STREAM OBSTRUCTIONS.

Ill Ann Stat ch 24, secs 11-111-1 thru 11-111-10, 11-111.1-1 (Smith-Hurd 1962).

Descriptors: *Illinois, *Surface drainage, *Drainage engineering, *Obstruction to flow, Legislation, Legal aspects, Drainage districts, Drainage, Cities, Overflow, Rivers, Public health, Taxes, Assessments, Surveys, Construction, Structures, Embankments, Levees, Dikes, Natural streams, Flood protection, Financing, Watercourses, Landfills, Grading, Environmental sanitation, Standing waters.

When a city is wholly or partially subject to overflow and wholly or partially surrounded by levees, dikes, or embankments, to prevent overflow it may: (1) divide the city into improvement districts; (2) fix the grade of the streets or public grounds at any height deemed necessary to give a surface drainage to the river which causes the overflow; and (3) require low lots, blocks, or parts thereof to be filled in such a manner as to prevent water from standing thereon and thus to prevent them from becoming a nuisance or injuriouis to the public health. Methods of survey for cost estimates of necessary construction and of financing are specifically set out. City authorities may remove any obstructions from natural and other watercourses which cause the flooding of any part of the city, regardless of where such obstructions are located. (Keith-Florida)

PEAT AND MUCK DRAINAGE PROBLEMS,
Agricultural Research Service, Athens, Ga. Southeast Watershed Research Center.
John C. Stephens.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR2, Pap 6603, p 285-305, June 1969. 21 p, 13 fig, 23 ref.

Descriptors: *Droughts, *Drainage, *Drying, *Peat, *Muck soils, *Florida, Ecology, Conservation, Swamps, Subsidence, Organic soils, Dehydration, Oxidation, Burning, Land subsidence, Water table, Water level fluctuations, Erosion.
Identifiers: *Everglades.

Drainage of organic soils results in lowering of the surface (subsidence) by shrinkage due to drying, loss of the buoyant force of groundwater, compaction, wind erosion, burning, and biochemical oxidation. The relative effect of each of these factors depends on soil origin, land-management practices, and climate. The total subsidence rate is proportionate to depth of drainage--the lower the water table, the greater the soil loss. In the Florida Everglades the largest losses have been due to biochemical oxidation. With continued subsidence these organic soils will be too shallow for agriculture by the year 2000. Here, drainage has permitted sea water to move inland contaminate the Biscayne aquifer, and has also changed the original ecology of the Everglades area to the detriment of wildlife. Recent water-management programs (1945-68) have ameliorated the consequences of overdrainage. Subsidence of organic soils with drainage occurs worldwide with observed rates up to 3 inches annually. To obtain maximum use of organic soils, drain only those lands that are potentially arable, place drained lands into productive use quickly, and hold water tables as high as crop and human requirements permit. (Knapp-USGS)
W70-00229

MILLS AND MILL DAMS.

Ark Stat Ann secs 35-501 thru 35-526 (1962).

Descriptors: *Mill dams, *Riparian rights, *Flood damage, *Arkansas, Dams, Structures, Mills, Dam construction, Legislation, Damages, Damsites, Fish barriers, Alteration of flow, Canals, Conveyance structures, Overflow, Navigable waters, Engineering structures, Maximum probable flood, Relative rights, Legal aspects, Adjudication procedure.

Any person may erect a dam across a non-navigable watercourse if he owns the land through which such watercourse runs. If water is likely to overflow onto another's land, the person proposing to erect the dam must petition the circuit court for authorization. A jury examines the site and finds estimated damage, type of property that will be inundated, obstructions to fish and navigation, and dangers to health that might ensue. If the builder owns only one side of the stream, he must follow similar proceedings. In addition, he must compensate the owner of land on the opposite side for the equivalent value of one acre of land. This value is determined by the viewing jury. Property-owners subject to damage and the opposite landowner must appear before the court, which considers their testimony together with the inquest returned by the jury in passing on the petition. The order is conditioned upon making provisions for fish passage, payment of damages and valuations, and immediate commencement of work. If the dam is damaged, repairs must be made within three years. The inquest does not bar unforseen damages, and double damages are recoverable if provisions of this act are violated. Similar procedures are followed for cutting a canal through another's property. (Douberley-Florida)

COUNTY LINE BRIDGES.

Ind Ann Stat secs 36-2001, 36-2002 (1949).

Descriptors: *Indiana, *Bridge construction, *Local governments, *Boundaries (Property), Bridges, Repairing, Streams, Legislation, Cost repayment, Construction, Cost allocation, Construction costs, Public benefits.

When public convenience shall require the erection, repair, or purchase of any bridge across a stream forming the boundary-line between two or more counties, the board of commissioners of either county may declare its willingness to aid in such improvement. Whenever the other county or counties' board of commissioners declare a like willingness, such improvement may be begun by agreement between the counties. If any county refuses to aid in such improvements, then the improvements may be made by the willing county alone if in its opinion the public convenience requires it. If the cost of such bridge or repairs does not exceed $10,000, the county making such improvements may recover the amount which the benefited county should have paid had it joined in the improvements. Each county shall be regarded as owner of an interest in any bridge provided for in this section and shall have a voice in regulating the use thereof. (Smith-Florida)

INTERSTATE BRIDGES.

Ind Ann Stat secs 36-2401 thru 36-2469 (1949), as amended, (Supp 1968).

Descriptors: *Indiana, *Bridge construction, *Administration agencies, *Interstate rivers, Legislation, Taxes, Costs, Operating costs, Rivers, Streams, Condemnation, Construction, Operation and maintenance, State governments, Highways, Construction costs, Tax rate, Contracts, Interstate commissions, Interstate compacts, Bridges, Interstate, Cities, Railroads, Financing.
Identifiers: *Interstate bridges, Tolls.

Indiana counties and municipalities bordering on state-line rivers or streams are authorized to cooperate with subordinate divisions of adjoining states in building and maintaining bridges across such waters and to pay one-half the expenses thereof. The act includes provisions for: (1) petitioning, levying of taxes, bonding, and appropriation; (2) creating county bridge commissions; (3) creating temporary and permanent joint commissions formed with commissions of another state; (4) purchasing and condemning lands and rights; (5) changing the location of obstructions impeding work; (6) operating bridges; (7) tolls; (8) bridge construction and control, by county bridge commissions, independent of the authorities of an adjoining state; and (9) disbursements by bridge commissions. The Indiana State Highway Commission is authorized to construct state-line bridges, and provisions are made for: (1) bridge location; (2) estimation of costs and the issuance of bonds; (3) a tax levy; (4) bridge maintenance; (5) tolls; and (6) interstate contracts. Provision is also made for the purchase of state-line bridges by cities for public aid to corporations erecting such bridges and for the use of such bridges by railroad companies. (Marsee-Florida)

INTERSTATE BRIDGES.

Ind Ann Stat secs 36-2422 thru 36-2455 (1949).

Descriptors: *Indiana, *Bridge construction, *Administrative agencies, *Highways, Legislation, Taxes, Costs, Operating costs, Rivers, Streams, Construction, Operation and maintenance, State governments, Construction costs, Tax rate, Contracts, Interstate, Financing, Regulation, United States, Legal aspects.
Identifiers: *Interstate bridges, Tolls.

The Indiana State Highway Commission is authorized to construct and maintain highway bridges over interstate rivers and streams whenever such bridge or any part thereof, including approaches, will be within Indiana. Such bridge may be constructed at any point, subject to the approval of the proper authorities of the United States, and the Commission may build any necessary part of such bridge within the territorial limits of another state. The Commission is also authorized to negotiate and contract with the adjoining state for the procurement of the right to build, maintain, and operate such bridges. The Commission shall submit an estimate of the cost of such bridge to the auditor of the county where the bridge is to be located, and that county shall issue bonds for such construction as provided herein. The county shall also levy an annual property tax to meet the principal and interest of bonds. Subject to a grant of authority from the United States, the Commission shall charge toll for the use of such bridges and shall fix the rates of such toll. The Commission shall also make rules governing the use of said bridges. (Marsee-Florida)

INTERSTATE BRIDGES.

Ind Ann Stat secs 36-2456 thru 36-2469 (1949), as amended, (Supp 1968).

Descriptors: *Indiana, *Bridge construction, *Administrative agencies, *Interstate rivers, Legislation, Taxes, Costs, Construction costs, Rivers, Streams, Condemnation, Construction, Highways, Contracts, Interstate compacts, Bridges, Cities, Railroads, Financing, Local governments.
Identifiers: *Interstate bridges, Tolls.

The Indiana State Highway Commission may cooperate and contract with adjoining states to provide payment for the construction of interstate bridges. Such payment is not to exceed one-half the cost of construction. Any city of Indiana or an adjoining state may purchase shares of stock in any interstate-bridge company or corporation. Any city holding four-fifths of all shares in such company, and unable to agree with the other share owners on the purchase of the remaining shares, may con-

demn and appropriate such shares for public use. Such bridge shall then become the property of such city. Counties and townships wherein an interstate bridge may be located may take stock in or make donations to corporations erecting such bridges, and cities may guarantee the payment of bonds of any such company. All railroads shall have the right to use any bridge constructed under this act, and terms as to toll and rates shall be set by agreement with the company operating the bridge or by the circuit court. To provide for a cumulative bridge fund, county commissioners, town boards, and city councils may levy a tax on personal and real property. (Marsee-Florida)
W70-00377

ENGINEER FOR LEVEE AND DRAINAGE DISTRICTS.

Iowa Code Ann secs 455.12, 455.17, 455.18 (1949), as amended, (Supp 1969).

Descriptors: *Iowa, *Engineering, *Project planning, *Drainage districts, Legislation, Legal aspects, Levees, Administrative agencies, Ditches, Drains, Basins, Public benefits, Surveys, Public health, Settling basins.

The board of supervisors shall appoint a disinterested and competent civil engineer who shall give bond to the county for the use of the proposed levee or drainage district. The engineer shall examine the lands described in the petition and any other lands which would be benefited by said improvement or necessary in carrying out the same. He shall locate and survey such ditches, drains, levees, settling basins, and other improvements as will be necessary, practicable, and feasible in carrying out the purposes of the petition and which will be of public benefit or conducive to the public health, convenience, or welfare. The engineer shall make a full written report to the county auditor setting forth the specifics of his plans. (Heckerling-Florida)
W70-00387

RAILWAY CROSSINGS NEAR MISSISSIPPI RIVER.
Iowa Code Ann sec 478.28 (1949).

Descriptors: *Iowa, *Railroads, *Mississippi River, *Shores, Legislation, Legal aspects, High water mark, Construction, Maintenance, Cities, Administrative agencies.

When in the construction of a railway it becomes necessary to cross another railway near the shore of the Mississippi River, each shall be so constructed and maintained at the point of crossing that the respective roadbeds thereof shall be above high water mark in such river, but where the crossing occurs within the limits of any city or town containing six thousand or more inhabitants, the council or other government authorities thereof may establish the crossing grade. (Heckerling-Florida)

SOMERSET VILLA INC V CITY OF LEE'S SUMMIT (APPORTIONMENT OF FLOOD DAMAGES).
436 SW2d 658-666 (Mo 1969).

Descriptors: *Missouri, *Flood damage, *Overflow, *Damages, Jucidical decisions, Floods, Cloudbursts, Rain water, Runoff, Surface runoff, Obstruction to flow, Natural flow, Artificial watercourses, Drainage, Surface drainage, Legal aspects.
Identifiers: *Apportionment of damages.

During a rainstorm, plaintiff's apartment complex was damaged by flooding allegedly caused by the negligence of a nearby shopping center and by the maintenance of a nuisance by the local municipality. The alleged negligence of the shopping center consisted of allowing a diverted drainage watercourse to become fouled with debris, diminishing the flow of natural drainage from the parking lot. The city was charged with negligently and carelessly maintaining its streets and culverts by permitting weeds and debris to obstruct drainage. In accordance with the lower court's instructions, a general verdict was returned against both defendants jointly. On this appeal, the supreme court reversed and remanded the case for a new trial on the grounds that the city and the shopping center could not be held jointly liable for the entire damage. Quoting extensively from Prosser, the court held that a defendant is liable only for such portion of the total flood damage as may be properly attributed to the negligence of his own acts. (Douberley-Florida)
W70-00389

DRAINAGE DISTRICTS EMBRACING PART OR WHOLE OF CITY OR TOWN.

Iowa Code Ann secs 459.1 to 459.12 (1949), as amended, (Supp 1969).

Descriptors: *Iowa, *Drainage districts, *Cities, Legislation, Drainage systems, Drainage programs, Sewers, Cost-benefit analysis, Cost-benefit ratio, Estimated benefits, Public benefits, Cost allocation, Financing, Assessments, Drainage, Local governments, Legal aspects, Administrative agencies.
Identifiers: Counties.

The board of any county has the same power to establish a drainage district that includes whole or part of a city or town as they have to establish a district outside a city. A district may not be established wholly within the city limits or for sewer purposes. When a city is benefitted by district improvements, the commissioners classify and assess the benefits and serve notice on the city clerk and on the owners of the lots, parcels and railway rights of way assessed. Provisions are made for objections to the assessments. The board or the city council has the same power to issue improvement certificates, drainage bonds, or waivers for benefits to public property as conferred with relation to assessment for benefits to highways. Cities may issue bonds to pay assessments. When all of a city is included in a district and makes up over one-fourth of the district, the city may request that the county relinquish authority and control of the drainage district if drains are needed or used for storm sewer and drainage purposes. The city takes complete control and responsibility for maintenance. (Douberley-Florida)
W70-00390

SENECA PORT DISTRICT.

Ill Ann Stat ch 19, secs 352.14, 354.1-354.4, 364 (Smith-Hurd 1963).

Descriptors: *Illinois, *Administrative agencies, *Navigable waters, *Port authorities, Legislation, Regulation, Riparian rights, Docks, Piers, Bulkheads, Jetties, Bridges, Weirs, Shores, Shorelines, Public rights, Navigation, Water management, Public benefits.
Identifiers: *Penalties (Civil).

Navigable waters are any public waters used or usable for water commerce. The Seneca Port District has the power to issue permits for the following: construction of all wharves, piers, dolphins, booms, weirs, breakwaters, bulkheads, jetties, bridges, or structures over, under, in, or within forty feet of any navigable waters within the district, and the depositing of rock, earth, sand, or other material in said waters. The district is responsible for the prevention or removal of obstructions, the location and establishment of dock and shore lines, and the regulation of navigation and bridges. The district regulates the depositing of refuse or other material near navigable waters. Any structure, fill, or deposit erected or made in any of the public waters within the port district in violation of these regulations is a purpresture and may be abated as such at the expense of the person responsible therefore or modified as the district may direct. (Moulder-Florida)
W70-00393

DRAINS AND LEVEES-CONSERVANCY DISTRICTS.

Ind Ann Stat secs 27-1501 thru 27-1508 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Water conservation, *Water districts, *Administrative agencies, Legislation, Water resources, Water resources development, Water utilization, Water treatment, Wildlife conservation, Water supply, Water policy, Soil conservation, Flood control, Drainage, Waste treatments, Waste disposal, Sewage treatment, Sewage disposal, Recreation facilities, Recreation demand, Federal government, Local governments.

To better meet the serious problems of water management in the state, landowners may organize water conservation districts which have the power to levy taxes and other necessary powers so that maximum beneficial utilization can be made of Indiana's water resources. Districts may be established for: (1) flood prevention and control; (2) improving drainage; (3) irrigation; (4) providing water supply; (5) collecting, treating and disposing of sewage and liquid waste; (6) developing forests, wildlife areas, parks, and recreational facilities; and (7) preventing erosion. These purposes may be accomplished by cooperating with state and federal agencies. Districts may only operate within bounds of the purposes for which they were established, but can add additional purposes by following the procedures provided for the establishment of districts. Cities may be included within a district provided that the majority of freeholders thereof have petitioned to be included. Freeholders desiring the establishment of a district must file a petition with the circuit court of the county containing the most land within the proposed district. Area may be added to a district in the same manner. (Marsee-Florida)
W70-00395

PLANS OF RECLAMATION.
SC Code Ann secs 18-471 thru 18-490, 18-501 thru 18-508, 18-521 thru 18-528 (1962).

Descriptors: *South Carolina, *Land reclamation, *Drainage programs, *Administration, Dikes, Dams, Bridges, Buildings, Eminent domain, Costs, Cost allocation, Cost benefit analysis, Legislation, Reclamation, Roads, Road construction, Drainage districts, Appraisals, Damages, Drainage, Land development, Financing, Loans, Taxes, Administrative agencies, Channeling, Construction.

A plan for reclaiming lands from overflow or damage by water shall be adopted by the board of supervisors of the drainage district, based upon a report from the chief engineer. Three court appointed commissioners shall appraise all lands involved and shall assess the amount of benefit and damage that will accrue to each tract of land. If the costs are found to be excessive, the court shall dissolve the district. The board of supervisors of the drainage district is empowered to finance the administration costs by appropriate taxes and loans. The board may build, excavate, construct, and complete all works needed to maintain the plan of reclamation. In order to effect the plan, the board may: (1) alter any watercourse in any manner; (2) construct and maintain ditches, canals, levees, dykes, dams, bridges, roads, or any other works improvement deemed necessary; (3) remove any fence or building; (4) hold, control, condemn, and acquire any land or water; and (5) construct any hydroelectric plants. If any corporation shall refuse to construct or enlarge its bridge, the board shall proceed to let the work at the corporation's expense. (Smith-Florida)
W70-00396

CONSTRUCTION OF LEVEES AND FLOOD CONTROL PROJECTS.
Ark Stat Ann secs 20-334, 20-336 (1968).

Descriptors: *Arkansas, *Construction, *Flood control, *Eminent domain, Legislation, Land tenure, Cities, Projects, United States, Contracts, Operation and maintenance, Administrative agencies, Railroads, Right-of-way, Condemnation, Damages, Assessments, Legal aspects, Levees, Land use.
Identifiers: Improvements.

Municipal levee and flood control improvement districts may construct and maintain levees and flood control projects under, over, across, and along the waters and lands belonging to the state, along and over public streets and highways, along and across any railroad right-of-way, and on and over any lands belonging to the municipality. The improvement district may enter contracts with the United States for the construction of such levees or flood control projects. The circuit judge of any county shall appoint appraisers to assess damages when private land for such projects is taken by eminent domain. (Heckerling-Florida)
W70-00398

SOIL AND WATER CONSERVATION COMMISSION.

Ark Stat Ann secs 9-118 thru 9-128 (Supp 1967).

Descriptors: *Arkansas, *Administrative agencies, *Water conservation, *Soil conservation, Local governments, Interstate rivers, Interstate compacts, Drainage systems, Irrigation, Flood protection, Legislation, Water supply, Reservoir storage, Industrial water, State governments, Conservation, Flood control, Federal government, Water control.

The Arkansas Soil and Water Conservation Commission assumes the functions and duties of the now abolished Water Conservation Commission and the Water Compact Commission. The Commission also has all the powers and duties of the Arkansas Geological and Conservation Commission that relate to soil conservation and flood control. Among other powers, the Commission has authority to (1) negotiate with adjoining states concerning the protection and use of interstate waters; (2) cooperate with other states' agencies and federal departments to further water and soil conservation and flood protection; (3) cooperate with local organizations and drainage districts in the development and construction of flood control, drainage, and irrigation projects; and (4) cooperate with counties and municipalities in the development of water supply and storage facilities for consumption and industrial use. (McDonough-Florida)
W70-00404

FLOOD PREVENTION.
Ind Ann Stat secs 48-4901 thru 48-4952 (1963), as amended, (Supp 1968).

Descriptors: *Indiana, *Flood control, *Local governments, *Flooding, Flood plain zoning, Flood protection, Levees, Dikes, Streams, Eminent domain, River training, Obstruction to flow, Barriers, Bridges, Costs, Cost-benefit ratio, Cost allocation, Cost sharing, Alteration of flow, Channelling, Construction, Bridge construction, Legislation.

When any street of any city is subject to flooding by a stream bordering upon or running through such city, and when such flooding may be lessened or prevented by altering or changing such stream, construction or enlargement of dykes or levees, removal of obstructions or encroachments on such stream, or the elevation of any bridge, then such city may petition the circuit court in that county to have such corrective action taken. The court shall determine who shall bear the expenses and may appoint two appraisers to apportion the costs among the parties according to the portion of benefit received. Any dissatisfied party may appeal. Any city may seek to have any proposed bridge construction enjoined if flooding may result from such bridge. Any city may petition the circuit court for the creation of flood control districts. Each flood control board is authorized to perform all acts necessary to carry out the purposes stated in the court's decree. Such board's powers shall include the power of eminent domain. (Smith-Florida)
W70-00405

ACQUISITION OF STATE LANDS BY THE FEDERAL GOVERNMENT.
Ark Stat Ann secs 10-1101, 10-1103, 10-1105, 10-1107, 10-1111 (1958), as amended, (Supp 1967).

Descriptors: *Arkansas, *Flood control, *Land use, *Federal government, Migratory birds, Conservation, National wildlife refuges, Irrigation, Fish hatcheries, Hydroelectric plants, Dams, Legislation, Public lands, Watershed management, Channel improvement, Land development, National forests, Condemnation, Navigable waters, Wildlife management.
Identifiers: Land acquisition.

Arkansas consents to United States' purchase of and cedes its jurisdiction to any site or grounds for the erection of any navy yard, custom house, lighthouse, lock, dam, or fish hatchery. When necessary the United States may acquire Arkansas land by purchase, condemnation, or otherwise for the construction of dams, reservoirs, floodways, canals, hydroelectric power plants, channel improvement and channel diversions for the control of floods, irrigation of lands, and the development of hydroelectric power. The federal government may acquire Arkansas forest lands for national forest purposes in cooperation with the state for the protection of navigable stream watersheds. The federal government may establish fish and game regulations in national forest areas; these rules run concurrently with those of the Arkansas game and fish commission. The United States may acquire such lands and waters as the Secretary of the Interior deems necessary in furtherance of migratory bird acts. (McDonough-Florida)
W70-00406

ORGANIZATION OF DRAINAGE DISTRICTS.

Ill Ann Stat ch 42, secs 1-1 thru 1-7 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Drainage districts, *Adjudication procedure, *Jurisdiction, Legal aspects, Ditches, Drainage systems, Administration, Drains, Organizations, Legislation, Administrative agencies.

The county circuit courts have jurisdiction over all matters pertaining to the organization and operation of drainage districts. Petition for the organization of a district must be filed with, and all subsequent proceedings had in, the circuit court of the county wherein the greater portion of the land in the proposed district is located. All districts heretofore organized under prior acts, their assessments and proceedings are declared valid. The commissioners of districts organized under prior law must file a report with the appropriate circuit court for the purpose of transferring jurisdiction over and records of such existing districts to the court. For purposes of this act ditch, drain, drainage district, drainage structures, drainage system, landowner, and sanitary purposes are defined. (Marsee-Florida)

GROUNDWATER GEOLOGY OF ALLUVIAL FAN AQUIFERS LOCATED IN THE WESTERN THIRD OF THE GWYDIR RIVER VALLEY, NEW SOUTH WALES, AUSTRALIA,
Northern Illinois Univ., DeKalb. Dept. of Geology.
Loren T. Caldwell.
Water Resources Bull, Vol 5, No 3, p 3-17, Sept 1969. 15 p, 7 fig, 1 tab, 7 ref.

Descriptors: *Water resources, *Surveys, *Groundwater, *Aquifers, *Alluvium, Water resources development, Irrigation water, Water wells, Water yield, Hydrologic data, Data collections, Water quality, Transmissivity, Stratigraphy.
Identifiers: *New South Wales (Australia), Gwydir Valley, Alluvial fans.

Logs of 118 water wells in the western third of the Gwydir River Valley, New South Wales, Australia were studied to determine the location and extent of good aquifers in an alluvial fan. Well depths, aquifer thicknesses, water yields, and well locations are tabulated, mapped, and correlated. The aquifers consist of sand, gravel, and basaltic alluvium in distributary channels. The deepest of 4 identified aquifers is 75-250 ft deep and has a maximum capacity of 180,000 gph from 30 wells. The other 3 aquifers are shallower and have 45 wells with a total maximum yield of 138,000 gph. The surface expressions of the good aquifers may be used for locating irrigation well sites. (Knapp-USGS)

TECHNICAL ASPECTS OF GROUND-WATER RECHARGING (IN DUTCH),
Dienst der Publieke Werken, Amsterdam (Netherlands).
J. Bardet.
De Ingenieur, No 51, p A758-A762, Dec 20, 1968. 7 fig.

Descriptors: *Ground-water recharge, *Settlement, *Power plants, *Cooling water, Groundwater.

If ground-water is pumped up for cooling purposes, considerable risks are encountered when the subsoil layers are compressible. These risks can be minimized in many instances by judiciously planned recharging methods. As a whole, preliminary investigations, recharging-outfit maintenance and controlling measures are rather expensive. If possible, other methods of cooling, etc., would seem preferable. (Rietveld-Vanderbilt)

W70-00302

4C. Effects on Water of Man's Non-Water Activities

DRAINS AND LEVEES AFFECTING HIGHWAYS.
Ind Ann Stat secs 27-407, 27-408 (1960).

Descriptors: *Indiana, *Highways, *Erosion control, *Slope protection, Drainage, Ditches, Stream erosion, Streams, Overflow, Administrative agencies, Costs, Construction, Construction costs, Jurisdiction, Federal jurisdiction, Levees, Embankments, Roadbanks, Bridges, Eminent domain, Maintenance, Watercourses (Legal), Bank protection, Bank erosion, Legislation, Legal aspects, Navigable waters, Right-of-way, Drainage systems.
Identifiers: *Highway protection.

Governing bodies or state agencies charged with the construction, maintenance, and repair of public highways and bridges may protect same from damage by erosion, wash, slides, change of course or overflow by: (1) changing or restoring the course of any watercourse; (2) protecting the banks or slopes of watercourses by necessary construction work; or (3) constructing walls or levees if practicable or less expensive. When any navigable stream is under the jurisdiction of a federal authority or agency and the proposed work conflicts with that jurisdiction, highway officials must obtain the consent of such agency before commencing work. Maintenance and construction costs must be paid out of the appropriate fund of the agency performing the work. The governing or administrative bodies charged with the control of highways may procure rights of way, property, or interests in land outside the limits of any highway by grant, purchase, donation, or eminent domain. Persons wishing to alter drainage systems along highways must first receive approval from the State Highway Commission of Indiana or the board of county commissioners; this provision does not affect the restoration of existing ditches or drainage systems to their original specifications. (Marsee-Florida)
W70-00011

SOME EFFECTS OF URBANIZATION ON RUNOFF AS EVALUATED BY THORNTHWAITE WATER BALANCE MODELS,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Geography.
Robert A. Muller.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 127-136, 1967. 10 p, 4 fig, 5 tab, 5 ref.

Descriptors: *Rainfall-runoff relationships, *Water balance, *Urbanization, New Jersey, Evaporation, Rainfall, Runoff, Hydrologic budget, Infiltration, Water storage, Flood control.
Identifiers: Thornthwaite method, Raritan River basin (NJ).

In order to gain some understanding of hydroclimatological processes and interrelationships associated with urbanization of drainage basin, water balance methodology including the Thornthwaite potential evapotranspiration and water balance models are applied to the Raritan River basin in New Jersey. The precise objectives are to compare and contrast selected Thornwaite water balance components as calculated by several more or less 'standard' techniques, to demonstrate that potential evapotranspiration and water balance models can be utilized as hydroclimatological controls to obtain first approximations of the consequences of land cover type change or urbanization within a river basin, and to explore briefly generated water balance data based on the assumption of the transformation of a watershed from rural to urban. Calculated runoff takes into account the monthly and seasonal variation of precipitation and soil moisture storage as well as energy availability for evapotranspiration loss. Measured runoff not only includes the climatic variation but in addition the effects of land use change. Hence, the differences between calculated and measured runoff over time should be a measure of the effects of land use change on runoff. (Knapp-USGS)
W70-00057

WATERS--RIPARIAN RIGHTS--PROPERTY IN FLOW OF STREAM.

Colum L Rev, Vol 45, No 5, p 792-795, Sept 1945. 4 p, 23 ref.

Descriptors: *Riparian rights, *Federal government, *Water utilization, *Streamflow, Stream improvement, Navigation, Industries, Damages, Compensation, Judicial decisions, Navigable waters, Non-navigable waters, Easements, Water level fluctuations, Legal aspects, Streams, Hydroelectric plants, United States, Ownership of beds, Water rights.

Power from claimant's hydroelectric plant located on a navigable stream was developed by the fall of water from the artificially raised level of a non-navigable stream entering into the St. Croix, a navigable stream. The level of the St. Croix was raised by the United States to improve navigation, thus causing a loss of power to claimant. The United States Supreme Court held that the economic loss suffered by claimant was not a taking of property for which compensation must be made under the Fifth Amendment. The existence of private property rights in the bed of a navigable stream is determined by the law of the state in which the stream is located. However, these rights are subject to the superior rights, powers, or dominant easements possessed by the federal government. It is well settled that there can be no private property rights in the flow of a navigable stream as against the government. It would seem that if the court had considered the economic loss in the instant case as consequential, the holding would have been more in accord with prior precedents. Moreover, in an analogous situation, the interference with subsurface drainage, the result has also been held consequential. (Heckerling-Florida)
W70-00091

JURGESON V ROMINE (DAMAGES RESULTING FROM OBSTRUCTING THE FLOW OF A CREEK).
442 SW2d 176-178 (Ct App Mo 1969).

Descriptors: *Missouri, *Obstruction to flow, *Flood damage, *Damages, Crops, Streams, Legal aspects, Judicial decisions, Floodwater, Brush, Usufructuary right, Rain, Floods, Relative rights.

Plaintiff sued defendant for damages to growing crops caused by the flooding of plaintiff's crop land. Defendant deposited logs, brush, and other debris in a creek at a place where it flowed across his land. Several months later, plaintiff's crop land, which was adjacent to and upstream from defendant's property, was inundated by flood waters. The defendant appealed the lower court's decision in favor of plaintiff on the basis of instructions to the jury relating to damages. The lower court's instructions did not distinguish the cause of the damages from defendant's act of obstructing the creek and the damages that would naturally ensue from the heavy flooding. The court held that the instructions to the jury should inform them of the necessity of determining whether the damages alleged were caused by the obstruction or the flooding. Defendant could only be liable for damages proximately resulting from his obstructing the flow of the creek. (Holt-Florida)

GIANT FOOD INC V WASHINGTON-ROCKVILLE INDUSTRIAL PARK INC (DAMAGES FROM DRAINAGE).
253 A2d 867-872 (Md 1969).

Descriptors: *Maryland, *Drainage, *Drainage effects, *Drainage practices, Drainage water, Groundwater, Drainage systems, Land management, Paving, Running waters, Soil conservation, Surface waters, Excess water (Soils), Surface runoff, Mudflows, Soils, Silts, Legal aspects, Judicial decisions, Runoff, Floods, Floodwater.
Identifiers: Civil procedure, Demurrers.

This action arose when the original defendants, now third-party plaintiffs, were not allowed to join certain third-party defendants in a suit which was instituted against them by plaintiff Parklawn Inc, a large commercial cemetery in Montgomery County. Parklawn brought the original action to recover damages resulting from third-party plaintiffs' failure to take precautions necessary to prevent an increased run-off of water, dirt, silt, and debris onto plaintiffs' land. Such damage was allegedly caused when the owners of a shopping center complex next to Parklawn failed to make suitable adjustments to the natural drainage system after altering the natural state of the land in building the shopping center. The Maryland Court of Appeals held that, since Parklawn alleged negligence on the part of the defendants who in turn alleged that third-party defendants were liable to them for contribution, the lack of concert ab initio in the negligence which caused Parklawn's damage did not preclude third-party plaintiffs' joining such third-party defendants. The case was reversed and remanded with direction. (Johnson-Florida)

SEWERS AND DRAINS IN CITIES AND TOWNS.

Ind Ann Stat secs 48-3948 thru 48-3950 (Supp 1968).

Descriptors: *Indiana, *Local governments, *Drains, *Sewers, Administrative agencies, Construction, Benefits, Costs, Cost allocation, Cost-benefit theory, cost-benefit analysis.

Whenever the Board of Public Works orders the construction of any local sewer or drain, it shall adopt a resolution to that effect. A hearing will be held, after which the Board shall decide if the benefits to be derived are worth the estimated cost. (Darragh-Florida)
W70-00190

WATER RIGHTS.
Ind Ann Stat secs 27-1401 thru 27-1409 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Water rights, *Water users, *Water allocation (Policy), Preferences (Water rights), Riparian rights, Administrative agencies, Competing uses, Regulated flow, Relative rights, Domestic water, Impounded waters, Equitable apportionment, Industrial water, Irrigation programs, Low-flow augmentation, Water requirements, Reservoir operation, Distribution patterns, Distribution, Water contracts, Stock water, Surface waters, Groundwater, Watersheds (Basins), Beneficial use, Legislation, Reasonable use.
Identifiers: Public waters.

Surface waters of the state must be put to beneficial uses to the fullest extent possible in the interests of the general welfare. Water in any natural body, stream, or lake is a natural resource and public water. Diffused surface water is not public water. Owners of land contiguous to a public watercourse may impound or use diffused surface water for domestic needs when the flow in the stream or lake level is in excess of existing reasonable uses. Entities creating additional stream volumes by releases from impoundments may use such increased flowage, but riparian owners shall have no rights therein beyond normal stream flow. Upon approval of the Indian Flood Control and Water Resources Commission, persons may divert floodwaters for any useful purposes. The Commission shall mediate disputes between users of surface waters and may require reports on the volume of surface and

groundwater used. The Commission may dispose of and sell certain stored water. Surface water, groundwater, diffused surface water, watercourse, watershed, flood water of a watercourse, and water supply are defined. Standards for measurement of flowing and stored water are established. (Marsee-Florida)

AN OPERATIONS RESEARCH APPROACH TO BASIN SEDIMENT CONTROL,
Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Engineering Science.
Erhard F. Joeres.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 261-273, 1967. 13 p, 3 fig, 18 ref, 1 appe .d.

Descriptors: *Sediment control, *Optimization, *Dynamic programming, Sedimentation, Erosion, Economics, Costs, Floods, Damages, Computer programs, Model studies, Mathematical models.
Identifiers: *Sediment control optimization.

An economic investigation was made of the problem of drainage basin sediment control, and an analytical system was developed to optimize control measures to best meet the needs of society. Dynamic programming was used in the optimization because the elements of sedimentation costs are relatively independent of each other, and downstream decisions are influenced by actual operations upstream in the drainage basin. A schematic flow chart describes the optimization process, and the mathematical basis of each step is discussed. (Knapp-USGS)

OUTLINE OF ARKANSAS PLAN ON WATERSHED MANAGEMENT.

Am Forests, Vol 61, No 1, p 17, Jan 1955. 1 p.

Descriptors: *Arkansas, *Watershed management, *Surface waters, *Administration, Riparian rights, Appropriation, Condemnation, Regulation, Permits, Beneficial use, Administrative agencies, Recreation demand, Cities, Industrial water, Agricultural watersheds, Conservation, Administrative decisions, Legislation.

Arkansas follows the riparian doctrine. The riparian owner's right is a vested one and probably cannot be taken except by condemnation. Arkansas' water rights bill is intended to accomplish the following results: (1) declare the public policy to be that title and control of surface waters in excess of domestic needs of riparian owners is in the state; (2) create a water permit system favoring early applicants and those making a beneficial use of such water; (3) exempt domestic use from permits; (4) be flexible enough to permit the water commission to determine whether preference in a given watershed should be given to recreation and conservation of wildlife, municipal, industrial, agricultural, or other beneficial purposes; (5) provide for adequate notice to satisfy due process, and once a right conferred, it will have incidents of ownership similar to those in states following the appropriation doctrine, and (6) provide for adequate judicial review of administrative decisions. (Holt-Florida)

WABASH VALLEY COMPACT.
Ind Ann Stat secs 68-906 thru 68-911 (1961).

Descriptors: *Indiana, *Interstate commissions, *Resources, *Conservation, River basin development, Valleys, Optimum development plans, Interstate compacts, Water resources development, Interstate rivers, Water utilization, Planning.

The Wabash Valley Interstate Commission is created to encourage and facilitate coordinated development of the Wabash Valley. 'Wabash Valley' means the Wabash River, its tributaries and all lands drained by said river and tributaries. The Commission shall have the power to : (A) promote the balanced development of the Wabash Valley; (B) recommend integrated plans and programs for the conservation, development, and proper utilization of the water, land, and related natural resources of the valley; and (C) secure the necessary research and development activities. (Smith-Florida)

WATERSHED CONSERVANCY DISTRICTS.
Ky Rev Stat Ann secs 262.700 thru 262.795 (1963), as amended, (Supp 1968).

Descriptors: *Kentucky, *Administrative agencies, *Watershed management, *Watersheds, Erosion control, Flood control, Sediment control, Water conservation, Multiple-purpose projects, Decision making, Programs, Project planning, Water districts, Legislation, Financing, Condemnation, Tax rate, Assessments, Operating costs, Taxes, Soil conservation, Operation and maintenance.

Subdistricts of a soil conservation district may be formed into watershed conservancy districts and shall constitute a government subdivision of the state and a public body corporate. Their purpose shall be to develop and execute programs relating to water conservation, flood and erosion control, and prevention of floodwater and sediment damage. Provisions for the creation of such a district are outlined. A board of directors is to be elected, and provisions are made for membership, terms, officers, and qualification. The powers of the board, including taxation, acquisition of land, borrowing money, and construction and maintenance of needed structures are detailed. Provisions for an annual budget are included, and procedures for assessing and collecting taxes are provided. The processes for annexing or detaching land from the watershed district are described. A detailed procedural process for executing programs developed by the board is included. (Schram-Florida)

EROSION CONTROL AND IMPROVEMENT OF NAVIGABLE WATERS.
Ind Ann Stat secs 48-5208, 48-5210 thru 48-5219 (1963), as amended, (Supp 1968).

Descriptors: *Indiana, *Lake Michigan, *Erosion control, *Navigable rivers, Docks, Harbors, Navigation, Bank protection, Bank erosion, Erosion, Beaches, Beach erosion, Banks, Lakes, Jetties, Sea walls, River training, Channel improvement, Canals, Navigable waters, Condemnation, Local governments, Basins, Jurisdiction, Legislation, Administrative agencies.

To prevent erosion of the beach, bank, shore or land abutting on Lake Michigan, the board of public works or council of any city or town is empowered to construct proper jetties, groins and seawalls, to cause the shore on the land side of such sea-walls to be filled, and to make improvements as required by law. Any city or town may widen, straighten, or deepen any stream, water-course, canal, navigable stream or lake for harbor, dock, or wharf purposes or to facilitate navigation. Such city may take the necessary land by gift, purchase, or condemnation. In the case of streams or navigable rivers, they shall not condemn a strip more than three hundred feet wide unless necessary to construct a turning basin. Such city or town shall exercise this jurisdiction five miles beyond its corporate limits, except that permission shall be necessary when any other city or town falls within such five mile jurisdiction. Two or more cities may join in such work or in any project to construct a swinging gate or other structure. Where a river and a canal unite, they shall be considered one river. (Smith-Florida)

SPECTROPHOTOMETRIC DETERMINATION OF CHROMIUM WITH XYLENOL ORANGE AND METHYLTHYMOL BLUE,
Missouri Univ., Kansas City. Dept. of Chemistry.
K. L. Cheng.
Talanta, Vol 14, p 875-877, 1967. 3 p, 6 ref. Work supported by Grad School, Missouri Univ, and OWRR, Dept of Interior.

Descriptors: *Analytical techniques, *Chemical analysis, *Spectrophotometry, *Chromium, Laboratory tests, Colorimetry, Chemistry, Color reactions, Indicators, Test procedures.

Identifiers: Xylenol orange, Methylthymol blue, Complex ions.

A new simple and sensitive method for determining traces of chromium is described. Xylenol Orange and chromium (III) form a red complex at pH 3 on heating in boiling water for 20 min. The molar absorptivity is 19,000. No catalytic action of the bicarbonate ion, carbon dioxide, or chromium (II) generated by metallic zinc was observed. Methylthymol Blue is a less sensitive reagent for chromium, the molar absorptivity being 11,500. (Knapp-USGS)

THE FUTURE OF INSTRUMENTATION IN WATER POLLUTION CONTROL,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
James H. McDermott, Dwight G. Ballinger, and William T. Sayers.
Analysis Instrumentation, Vol. 6, p 97-104, 1969. 1 tab, 3 fig, 13 ref.

Descriptors: *Instrumentation, Management, Planning, Sanitary engineering, *Surveillance, *Water pollution control.

Public recognition of the fact that our water resources are limited has led to a stepped-up program for preserving and enhancing the quality and value of this natural resource. This is reflected in recent Federal and state legislation and in the size of the national clean-up program. Concomitant to this program is the need for field, laboratory, and aerial instrumentation capable of evaluating and controlling waste sources and the waters receiving these wastes. Automatic instrumentation presently available and that in the future are discussed.

MATHEMATICAL MODELS FOR EXPRESSING THE BIOCHEMICAL OXYGEN DEMAND IN WATER QUALITY STUDIES,
Iowa State Univ., Ames. Dept. of Civil Engineering; and Iowa State Univ., Ames. Engineering Research Inst.
Merwin D. Dougal, and E. Robert Bauman.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 242-253, 1967. 12 p, 4 tab, 13 ref. OWRR Proj No A-001-IA.

Descriptors: *Biochemical oxygen demand, *Mathematical models, *Statistical models, Statistical methods, Oxidation, Oxygen demand, Dissolved oxygen, Water pollution effects, Computer programs, Forecasting.
Identifiers: BOD Models, Monomolecular BOD models.

The development and application of the widely-used monomolecular model for biochemical oxygen demand BOD is reviewed. Results of laboratory BOD studies are used to reveal that the monomolecular model fails to satisfy its fundamental assumptions. Temporal variations in the rate constant and the ultimate BOD value are explored for three types of wastes: (a) raw domestic sewage, (b) final effluents from various waste treatment processes, and (c) contents of an agricultural waste lagoon. Two different mathematical models for BOD are presented which statistically are superior to the monomolecular model. These models may be useful in future studies of stream water quality and in the determination of stream assimilative capacities. (Knapp-USGS)

INVENTORY OF RADIONUCLIDES IN BOTTOM SEDIMENT OF THE CLINCH RIVER EASTERN TENNESSEE,
Geological Survey, Washington, D.C.
P. H. Carrigan, Jr.
Geol Surv Prof Pap 433-I, 1969. 18 p, 14 fig, 5 tab, 20 ref.

Descriptors: *Path of pollutants, *Radioactive wastes, *Tennessee, Radioisotopes, Sediments, Alluvium, Radiochemical analysis, Water pollution sources, Water pollution effects, Sampling, Surveys.
Identifiers: Oak Ridge, Clinch River (Tenn).

An inventory has been made of the radionuclides associated with bottom sediment in the lower Clinch River. The reach included in this inventory extends 21 miles from the mouth of the river to the mouth of Whiteoak Creek. The source of the radionuclides in the sediments was the release of low-level-radioactive waste waters from the Oak Ridge National Laboratory into Whiteoak Creek basin and thence into the river via Whiteoak Lake. Results of the inventory indicate that the following quantities of radioactivity were associated with the bottom sediment in July 1962: 150 curies of cesium-137; 18 curies of cobalt-60; 16 curies of ruthenium-106; at least 10 curies of rare earths; and 2.9 curies of strontium-90. Most of the radioactivity was found to be downstream from mile 15; about 95% of the identified radioactivity was in this reach. Maximum concentration of radioactivity occurred near the mouth of Whiteoak Creek. A high proportion of cesium-137 (21%), rare earths (about 25%), and cobalt-60 (9%) released to the river are retained in bottom sediment of the study reach. Retention of ruthenium-106 and strontium-90 is minor--less than 1% each. (knapp-USGS)

LAKE MICHIGAN POLLUTION AND CHICAGO'S SUPPLY,
Department of Water and Sewers, Chicago, Ill.
Hyman H. Gerstein.
J American Water Works Association, Vol 57, p 841-857, July 1965. 7 fig, 7 tab.

Descriptors: *Lake Michigan, *Water supply, Intakes, Nutrients, Quality control, Treatment facilities, Filtration, Sewage, Coliforms, Eutrophication, Odor, Ammonium compounds, Activated carbon, Chlorine, Phenols, Oil wastes, Hydrogen ion concentration, Fluorides, Alkyl benzene sulfonates, Wind velocity, Taste, Coagulation, Plankton, Monitoring, Temperature, Detergents, Phosphorus compounds, Diatoms, Biochemical oxygen demand, Dissolved oxygen, Color, Dissolved solids, Biodegradation, Algae, Iron, Sulfates.
Identifiers: *Pollution, *Chicago (Ill), Cook County (Ill), Calumet River (Ill), Pools, Wind direction, Tabellaria, Fragilaria, Asterionella, Filter clogging, Stephanodiscus hantzschii, Stephanodiscus binderanus, Cladocera, Water masses, U S Public Health Service, Great Lakes-Illinois River Basins Project, Indiana Harbor Ship Canal.

Although no sewage and industrial wastes are discharged along 30 miles of Chicago's lake front, gross pollution exists in the southern end of Lake Michigan. Data over 40 years reveal quality at the intakes, and, from 1950 to 1964, illustrate pollutional trends. A general increase of eutrophication indicators and increase in number and intensity of periods when pollutants seriously affected the intake at the South plant appear in the last ten years. Slugs of wastes may have abnormal odors, like those of oil refinery wastes diluted with lake water. Since 1948, samples have been collected one day each week at established points. Pollutional pools, influenced by wind-induced lake currents, were observable in a series of taste and odor incidents. The principal agent in treatment for removal of taste and odor is activated carbon. In treating highly polluted waters, application of chlorine sufficient to decompose ammonia-nitrogen may not adequately destroy the bacteria, whereupon bacteriologically unsafe water may result. Increasing plankton growth necessitates more frequent washing of filters; increased growth of filamentous algae together with appearance of new species of diatoms have caused additional problems with filters. Author presents, as practical and desirable, a series of criteria for quality of Chicago's water supply. (Jones-Wisconsin)

PHYSICAL, CHEMICAL, BACTERIAL, AND PLANKTON DYNAMICS OF LAKE PONTCHARTRAIN, LOUISIANA,
Louisiana State Univ., Baton Rouge.
Daniel H. Stern, and Michele S. Stern.
Louisiana Water Resources Research Inst Tech TR-4, Sep 1969. 60 p, 2 fig, 47 tab, 33 ref. OWRR Proj A-019-LA.

Descriptors: *Limnology, Sline lakes, Storm runoff, *Chemical properties, Physical properties, *Ammonia, Nitrification, Nitrates, Nitrites, Dissolved oxygen, Turbidity, Phosphates, Nutrients, *Coliforms, *Phytoplankton, Water sports.
Identifiers: *Lake Pontchartrain (La).

Sampling from Lake Pontchartrain between November 1968 and July 1969 shows that storm water from canals in Orleans and Jefferson Parishes degrades the water quality and disturbs the biorhythm of the aquatic microbiota. Especially after heavy rains, the increase in coliforms renders nearshore water and certain beaches unsafe for primary water sports. Phytoplankton, whose growth increases owing to nutrients in the storm runoff, add to the bottom organic materials when they die because the light available for photosynthesis has been reduced by turbidity. Bottom organic sediments stirred up by wave action during storms not only cause the turbidity but also furnish food for new planktonic growth. Thus the filling of the lake is hastened. The relationship between the total and fecal coliforms was not consistent. Recommendations include: counting of fecal coliforms to obtain a truer indication of pollution; prohibition of primary water sports at certain beaches after summer rains; careful regulation of proposed storm-water chlorination owing to the presence of ammonia, which retards disinfection and because of possible unreacted chlorine, which will disrupt the natural food cycle; and basin-wide cooperation to halt further pollution. PRELIMINARY MASS BALANCE OF BOD ON THREE NEW JERSEY RIVERS,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
William Whipple, Jr.
Water Resources Research Institute, Rutgers University. OWRR Proj B-002-NJ. Oct 1969. 94 p.

Descriptors: *Biochemical oxygen demand, *BOD, *Organic matter, *Water quality, *Organic loading, Oxygen demand, Dissolved oxygen, Oxygen, Oxygen sag, Water pollution, Effluents.
Identifiers: *BOD mass balance, Unknown organic loading, Unrecorded organic loading, Recorded organic loading, Background organic loading.

A preliminary accounting for organic loading of three New Jersey river basins was undertaken, with the intention of finding a measure of gross man-made pollution. The method used is called a BOD

mass balance analysis, being essentially a reconciliation between organic loadings in the streams, as revealed by water quality records, and the proportion of the loadings accountable for by recorded effluents from waste treatment plants. The most important finding is that on none of the three rivers did the recorded effluents account for as much as half of the total pollution in the stream. After subtraction of estimates of probable background loading, the remaining unknown but presumably man made wastes were very large. The implications from the viewpoint of water quality control are serious. (Whipple-Rutgers)

5C. Effects of Pollution

RELATION OF WATER QUALITY TO STRIPED-BASS MORTALITIES IN THE CARQUINEZ STRAIT OF CALIFORNIA,
Geological Survey, Menlo Park, Calif.
William D. Silvey, and George A. Irwin.
Geol Surv Open-file Rep, Mar 20, 1969. 12 p, 1 fig, 2 tab, 4 ref.

Descriptors: *Fishkill, *Striped bass, *Water pollution effects, *California solutes, Dissolved oxygen, Hydrogen sulfide, Toxicity, Morbidity, Industrial wastes, Solutes, Copper.
Identifiers: *Carquinez Strait (Calif).

No direct quantitative relations were found to indicate the cause of striped-bass mortalities in the Carquinez Strait area, California. Several possible causes of the mortalities were considered but could not be proven. Industrial effluents were considered as a possible cause of mortalities, but evidence was not found to show this possibility. Heavy metals (zinc, lead, and chromium) were analyzed but not found in large concentrations. Copper was found throughout the entire estuary in concentrations of about 0.10 mg/l. If copper was the responsible agent, the mortalities would have been widespread throughout the estuary, but they were not. Mortalities did not occur as a result of spawning. The lack of osmoregulatory adaptation to the sharp salinity gradient in Carquinez Strait is not a major cause of the mortalities. One major probable cause of the mortalities was natural hydrogen sulfide production. Large concentrations of biologically produced hydrogen sulfide were found on and in mudflats in Carquinez Strait at the time of the mortalities peak. Although this alone does not prove a direct cause and effect relation, biologically produced hydrogen sulfide, a natural phenomenon, is the most likely cause of striped-bass mortalities in Carquinez Strait. (Knapp-USGS)

THE IMPACT OF ANIMAL WASTES ON WATER RESOURCES ACTIVITIES,
Kansas Univ., Lawrence. Dept. of Civil Engineering.
Raymond C. Loehr.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 314-324, 1967. 11p, 2 fig, 2 tab, 28 ref.

Descriptors: *Farm wastes, *Confinement pens, *Water pollution sources, Waste disposal, Runoff, Water quality, Oxygen demand, Nutrients, Waste disposal.
Identifiers: Animal production industry wastes.

Until recently animal wastes have been considered as part of the natural or background pollution of a region, and uncontrollable. Animal production is changing from small farm operations into large scale industrial enterprises. There is an increasing trend to confine animals within small areas to produce the greatest weight gain in the shortest period of time. Under such conditions, it is not possible for these animals to drop their wastes on pastures where the wastes can be adsorbed by nature without adversely affecting environment. Animal wastes have been shown to be a major source of surface water pollution and have been implicated in several cases of ground water pollution. Some cases of pollution that have been caused by animal wastes and animal production operations are discussed and the trend toward confinement feeding operations and the magnitude of the problem are outlined. The need to consider animal wastes when developing or protecting water resources is demonstrated. On a volume basis, the total animal waste production in the United States exceeds that by the human population by an order of magnitude. (Knapp-USGS)

COMPUTATION OF LONGITUDINAL MIXING OF POLLUTION MATTER IN FLOWS (IN RUSSIAN),
Tallinn Polytechnic Inst. (USSR).
A. M. Aitsam, H. A. Velner, and L. L. Paal.
Sbornik statei po sanitarnoi technike IV, Trudy talinskogo politekhnitcheskogo instituta, seriya A, No 247, p 57-65, 1967.

Descriptors: *Mathematical models, *Turbulence, *Diffusion, *Mass transfer, Water pollution, Self-purification, Water quality, Stream pollution.
Identifiers: Turbulent mixing coefficient.

The basic equation of turbulent mass transfer of nonconservative pollutants was solved by Laplace transformation. The analytical solution obtained was complex, but was simplified and the approach to computation of it evaluated and shown practically. The values of the longitudinal mixing coefficient ascertained in some Estonian streams ranged from 0.1 to 1.0 msq/sec., and the decay coefficient of BOD decomposition rate lay within the interval from 0.1 to 1.0 1/day. The formula which was valid in the first step only for constant flow rate (Q= const.) including the linear dependence of discharge on distance, was used on the case of gradually increased flow rate. (Novotny-Vanderbilt)

COMPUTATION OF WASTE WATER MIXING AT SOME FIGURES OF WASTE LOAD OF FLOWS (IN RUSSIAN),
Tallinn Polytechnic Inst. (USSR).
L. L. Paal.
Sbornik statei po sanitarnoi technike IV, Trudy talinskogo politechnitcheskogo instituta, seriya A, No 247, p 75-89, 1967.

Descriptors: *Mathematical models, *Turbulence, *Mass transfer, Water pollution, Water quality, Stream pollution.

Solution of concentration wave at triangular, trapezoidal, exponential, and periodical waste load figure is based on the one-dimensional equation of longitudinal turbulent mixing of nonconservative matter. This equation containing the time derivative was solved by the Laplace transformation method respecting boundary conditions. (Novotny-Vanderbilt)
W70-00147

THE ENGINEERING CALCULATION OF THE PERMITTED LOADS OF THE POLLUTED WATER FLOWS (IN RUSSIAN),
Tllinn Polytechnic Inst. (USSR).
A. M. Aitsam, H. A. Velner, and L. L. Paal.
Materialy po voprosam samoochishcheniya vodoyomov i smeshcheniya stochnikh vod, Tall Pol Inst, p 87-108, June 7-10, 1965. 9 ref.

Descriptors: *Self-purification, *Oxygen sag, Waste assimilative capacity, Water pollution effects, Water quality, Stream pollution, Mathematical models, Environmental engineering.

Analytical solution of mass balance of either nonconservative or conservative pollutants in streams is presented. This solution is applied on BOD, DO, and conservative pollutants concentration changes, and was recommended for the water quality computation of small streams in Estonian SSR. The values of k (1), according to the kind of waste waters discharged into these streams, are tabulated and in the same way the values of Fair's factor f are computed. The solution takes into account the gradually increased flow rate and an additional BOD load. Practical examples and comparison with measured data of a small river basin are given. (Novotny-Vanderbilt)
W70-00148

COMPUTATION OF OXYGEN BALANCE OF WATERS POLLUTED BY WASTE WATERS (IN RUSSIAN),
Tallinn Polytechnic Inst. (USSR).
A. M. Aitsam, H. A. Velner, and L. L. Paal.
Sbornik statei po sanitarnoi technike I, Trudy talinskogo politekhnitcheskogo instituta, seriya A, No 212, p 103-129, 1964. 25 p, 9 fig.

Descriptors: *Waste assimilative capacity, *Oxygen sag, *Self purification, Water quality, Stream pollution.

The Streeter-Phelps formula for dissolved oxygen computation in small streams is criticized and a new differential equation of oxygen balance taking into account the dilution rate of waste in stream is proposed. On this basis it was stated that the Streeter-Phelps formula was valid only if waste waters discharged into rapidly flowing waters. The most critical point from the standpoint of the dissolved oxygen content is the reach of steam just below the waste effluent discharge. The field observation of some small streams in Estonian S.S.R. were used as a proof of validity of the proposed mathematical model. (Novotny-Vanderbilt)

THE MIXING OF WARM WATER FROM THE USKMOUTH POWER STATIONS IN THE ESTUARY OF THE RIVER USK,
Central Electricity Generating Board, Portishead (England). Research and Development Dept.
C. M. De Turville, and R. T. Jarman.
Int Journal Air and Water Pollution, Vol 9, p 239-251, 1965. 9 fig, 1 tab, 9 ref.

Descriptors: *Diffusion, Thermal power plant, Estuary, Thermal pollution, Cooling water, Mixing, Waste dilution.
Identifiers: Thermal water flumes, Diffusion coefficient, River temperature, Bridge-amplifier circuit, Ebb tide, Turbulent diffusion, Lateral diffusion, River Usk.

The temperature and flow of water in the River Usk estuary adjacent to the two power stations were measured during the hours around low water in a series of boat surveys. Analysis of the measurements made on the ebb tide showed that (a) the current was constant from 120 min before low water until the flow reversal occurred, (b) the flow reversal took 20 min on a spring tide (47 ft, 14 m) and was longer on a neap tide, (c) the warm water was bounded on each side with cool water and mixed laterally with it, and (d) the lateral diffusion coefficient was approximately 20000 cm sq./sec, which is similar to that found in oceans, if the scale length is taken to be the effective width of the estuary. (Ross-Vanderbilt)

EFFECTS OF HEATED DISCHARGES ON THE TEMPERATURE OF THE THAMES ESTUARY - II,
Water Pollution Research Lab., Stevanage (England).
A. L. H. Gameson, H. Hall, and W. S. Preddy.
Combustion, Vol 32, No 7, p 37-45, Jan 1961. 7 fig, 9 ref.

Descriptors: *Estuaries, *Heat transfer, Thermal pollution, Discharge (Water), Tidal effects, Mixing.
Identifiers: *Heated discharges, Thames Estuary, Tidal mixing, Temperature distribution.

This paper discusses rate of exchange of heat, derives equations for heat transfer and considers application of the methods used. Heat entering the estuary is dispersed by tidal mixing and displaced toward the sea by the flow of land water. The movement of the water and the mechanism by which the excess heat is lost is explained. Diagrams are given showing the distribution of water after periods of one, two, and three tides using various representations of symmetric mixing. The effects of radiation, evaporation, conduction, and convection on heat exchange are discussed. The four processes which occur in the estuary during the dispersion and cooling of a heated effluent are also discussed. (Ross-Vanderbilt)

CORRELATION BETWEEN PHOTOSYNTHESIS AND LIGHT-INDEPENDENT METABOLISM IN THE GROWTH OF CHLORELLA,
Tokugawa Inst. for Biological Research, Tokyo (Japan).
H. Tamiya, T. Iwamura, K. Shibata, E. Hase, and T. Nihei.
Biochimica et Biophysica ACTA, Vol 12, p 23-40, 1953. 13 fig, 3 tab, 6 ref.

Descriptors: *Chlorella, *Correlation analysis, *Photosynthesis, *Metabolism, Light intensity, Chlorophyll, Spores, Aerobic conditions, Temperature, Volume, Phosphorus, Nitrogen, Nutrients, Carbon dioxide, Respiration, Inorganic compounds, Oxygen, Anaerobic conditions, Growth rates, Life cycles, Growth stages.
Identifiers: *Growth, *Chlorella ellipsoidea, 'Dark cells', 'Light cells', Transformation, Interconversion, Nascent dark cells, Active dark cells, Autospores.

In culture, Chlorella cells assume two distinct forms, 'dark cells', smaller in size, richer in chlorophyll content and stronger in photosynthetic activity than the other, the 'light cells'. When illuminated, dark cells grow, with a substantial increase in mass, and turn into light cells; the latter, when ripened, bear autospores which are eventually set free, becoming individual dark cells. Transformation of light cells into dark cells involves no increase of cell mass and occurs only under aerobic conditions, either in light or dark. Dark cells freshly born from light cells are smaller in size and contain less chlorophyll than 'active' dark cells, into which the former turn rapidly under influence of light. In transformation of dark cells into light cells the main thrust is photosynthesis. Transformation of light cells into dark cells involves a light-independent and aerobically endergonic anabolic metabolism, although the transformation, in light, is accompanied by some photosynthetic processes. Authors found that, under weak light, the rate of growth is exclusively determined by photosynthetic processes, whereas light-independent metabolic processes become more or less significant in determining over-all growth rate in strong light. Formulae are constructed describing the processes. (Jones-Wisconsin)

DEATH OF A LAKE,
David C. Flaherty.
Quest, Vol 6, No 4, p 7-15, 1968. 9 fig.

Descriptors: *Lakes, *Algae, *Eutrophication, Oligotrophy, Nutrients, Water temperature, Dissolved oxygen, Fishkills, Limnology, Algal toxins, Algal control, Trace elements, Washington, Nuclear powerplants, Water pollution effects, Phosphorus, Nitrogen.
Identifiers: *Cultural eutrophy, *Nutrient balance, *Lake aging, Nutrient sources, Water sampling, Algal growth, Oxygen depletion, Nuclear activation techniques, Rock Lake (Wash), Williams Lake (Wash), Channeled Scablands (Wash), Washington State University.

Algae are the primary producers which initiate the food chain in lakes leading up to fish and man. In normal lakes, a rough balance exists between incoming nutrients, algal numbers, and their predators. However, this balance is upset by man's influence, hastening change from oligotrophic to eutrophic conditions. Detrimental effects of large numbers of undesirable algal forms, include oxygen depletion resulting in fishkills; flavor, odor, and color in water supplies; induced corrosion and slime in industrial water supplies; and endangering of other aquatic and terrestrial life forms from toxic substances. Studies conducted by Dr. William Funk, Washington State University Civil Engineering professor, on Rock and Williams Lakes in the Scablands basalts of eastern Washington are described. The basalts are relatively low in nitrogen and phosphorus, and decompose slowly, with consequent low natural nutrient income. However, these lakes are endangered by human activities. Present studies measure dissolved oxygen, temperature, light penetration, algal species, and concentrations of various elements including phosphorus and nitrogen. Nuclear activation techniques are used to detect trace elements which Dr. Funk suspects may have a critical role in algal growth. (Ketelle-Wisconsin)

Descriptors: *Primary productivity, *Streams, *Laboratory tests, Respiration, Environment, Photosynthesis, Oxygen, Trophic level, Light intensity, Ecology, Lotic environment, Biomass, Flow rates, Depth, Dissolved oxygen, Algae, Velocity, Water quality, Dissolved solids, Hydrogen ion concentration, Temperature, Nitrogen, Nutrients, Organic matter, Pigments, Chlorophyll, Diffusion, Cyanophyta.
Identifiers: Community, Specific conductance, Species, Melosira varians, Synedra ulna, Oedogonium, Phormidium retzii, Surface diffusion rate.

Six laboratory streams were used to study primary production and community respiration in simple communities under different environmental conditions. A photosynthesis-respiration chamber was developed which can be used to relate primary production to various environmental conditions and to verify direct measurement of primary production in laboratory or natural streams. Gross primary production in laboratory streams under 6000 lux of illumination ranged from 2.4 to 4.7 grams oxygen/square meter/day. Community respiration ranged from 1.6 to 4.2 grams oxygen/square meter/day. Ratios of photosynthesis to respiration usually varied between 1.0 and 2.0. Illumination intensity was approximately linearly related to primary production in range, 0-4000 lux, maximum photosynthetic rates obtaining at about 21,000 lux. Communities developing on the substrate were seeded naturally by species entering streams through the water supply. Composition of plant communities remained surprisingly constant, usually varying only in relative abundance of different species. The diatoms, Melosira varians and Synedra ulna consistently dominated; Oedogonium spp were sometimes very abundant during summer. Genera of blue-green algae were ubiquitous, frequently growing attached to sides of troughs, near the air-water interface. (Jones-Wisconsin)

SOME ASPECTS OF THE EUTROPHICATION OF WATER,
Water Pollution Research Lab., Stevenage (England).
Morlais Owens, and Gavin Wood.
Water Research, Vol 2, p 151-159, 1968. 3 fig, 2 tab, 17 ref.

Descriptors: *Eutrophication, *Nutrients, Cyanophyta, Fishkill, Reservoirs, Surface drainage, Fertilizers, Detergents, Sewage effluents, Industrial wastes, Lake Erie, Water pollution sources, Water pollution effects, Phosphorus compounds, Nitrogen compounds, Subsurface drainage.
Identifiers: *Great Britain, Nutrient removal, Nutrient concentrations, Nutrient sources, Algal blooms, Oxygen depletion, Flowing water, Eutrophication evaluation, Algal nutrient requirements, Surface-active materials, Lake Washington (Wash), Zurichsee (Switz), Potomac River (D C), Great Ouse (England), Lee River (England), Thames River (England), Oscillatoria rubescens, Anabaena flos-aquae, Water Pollution Research Laboratory (England).

Authors describe symptoms of eutrophication and evaluate the extent of enrichment and associated technical and economic problems. Increasing applications of fertilizers to land and greater use of detergents are partially responsible for higher concentrations of nitrogen and phosphorus in rivers of Great Britain. In the last ten years, amounts of nitrogenous fertilizers applied to agricultural land in Britain have doubled with consequent greater contributions of inorganic nitrogen to rivers from land drainage. Authors suggest, from indirect evidence, that approximately 50% of phosphorus in sewage effluents is derived from detergents. A nutrient balance sheet for a portion of the Great Ouse was constructed to determine the contribution of sewage effluents to the supply of major nutrients in the river. It indicated that while sewage effluents add only a small proportion of the total nitrogen, silicon, chloride, and sulphate, they are responsible for most of the phosphorus. Because of increased demands on water supplies, information on proportions of nutrients derived from various sources is important to base decisions on economically sound remedial action, e. g. establishment of treatment works for nutrient removal. CHARACTERISTICS OF HYPERTROPHIC LAKES AND CANALS IN CITIES,
State Zoological Inst. and Museum, Hamburg (West Germany). Hydrobiological Station.
Hubert Caspers.
International Association of Theoretical and Applied Limnology, Proceedings, Vol 15, p 631-638, Feb 1964. 2 fig, 2 tab, 13 ref.

Descriptors: *Lakes, *Eutrophication, *Canals, *Cities, Biological communities, Sewage, Detritus, Tubificids, Plankton, Diatoms, Cyanophyta, Phytoplankton, Rotifers, Chlorophyta, Copepods, Cycles, Chlamydomonas, Algae, Zooplankton, Fish, Chrysophyta, Seston, Self-purification.
Identifiers: *Hypertrophic waters, Hamburg (Germany), Chironomids, Cladocera, Aphanizomenon flos-aquae, Stephanodiscus hantzschii, Didinium, Paramecium, Phacus, Glenodinium, Cryptomonas,

Ciliata, Asterionella formosa, Recolonization, Alster Lake (Germany), Germany.

Alster Lake in Hamburg, Germany, is an example of a typical urban lake and demonstrates the special conditions in city waters, which are specialized habitats and where hydrobiological status can be more readily analyzed than complex sites of 'healthier' waters. Urban waters may constitute a restricted facies of eutropic water where destruction of original communities is typical and no new equilibrium develops. Rather, the relationship between buildup and breakdown of nutritive material, between producers and consumers, is always in a state of temporary equilibrium, and is constantly in danger of becoming unbalanced. The original community loses its most important zone of regeneration, the submerged plants along banks; bottom fauna is burdened with anaerobic processes resulting from inflow of detritus, leaving only a few species whose mass development is inhibited. The surviving plankton tends to instability and extreme variations from year to year. Nevertheless, there are certain definite and regular events which make urbanized waters a unique experimental situation, since the restricted facies of eutrophic water affords us limnological insight into forced production processes and their ecological effects. Author believes that conditions in urban waters improve when plants recolonize the banks. (Jones-Wisconsin)

CHANGES IN LAKE WASHINGTON FOLLOWING AN INCREASE IN THE NUTRIENT INCOME,
Washington Univ., Seattle. Dept. of Zoology.
W. T. Edmondson.
International Association of Theoretical and Applied Limnology, Proceedings, Vol 14, p 167-175, July 1961. 5 fig, 1 tab, 12 ref.

Descriptors: *Nutrients, *Productivity, Nuisance algae, Sewage effluents, Phosphorus, Eutrophication, Washington, Lakes, Water pollution effects.
Identifiers: *Lake Washington (Wash), *Lake changes, *Nutrient concentration, *Nutrient budget, Potential nutrient concentration, Areal income (Nutrients), Lake volume, Mean depth, Dilution, Oscillatoria rubescens, Madison lakes (Wis), Cedar River (Wash), Zurichsee (Switz), Turlersee (Switz), Greifensee (Switz), Paffikersee (Switz), Aegerisee (Switz), Fureso (Switz).

A dense bloom of Oscillatoria rubescens in 1955 prompted a study of Lake Washington to determine effects of a growing human population on lake eutrophication. One phase was an engineering survey made to establish the magnitude of sewage effluent and other sources of nutrients. Increases in nutrients from 1950-1955 were small compared with limnological changes. In order to compare the nutrient status of various lakes, a simple numerical basis of comparison of nutrient rate supply from outside sources is desirable. Systems which incorporate a consideration of the potential concentration of nutrients in lakes are preferable to those relating only income to area. Potential concentration can be related to the areal income and the mean depth of the lake as follows: areal income/mean depth=potential concentration (grams/square meter/meter=grams/cubic meter). The present work deals with only a portion of the problem--comparison of income of phosphorus among lakes. The author presents computations for several lakes in Wisconsin and Europe in addition to Lake Washington, also shows graphs of areal income plotted against potential concentration. Results of such calculations indicate that potential concentration is more closely related to algal standing crop than is the areal income. (Ketelle-Wisconsin)

THE DIATOMS OF A CORE FROM ESTHWAITE WATER,
Bristol Univ. (England). Dept. of Botany.
F. E. Round.
New Phytologist, Vol 60, p 43-59, 1961. 12 fig, 2 tab, 14 ref.

Descriptors: *Cores, *Diatoms, Sediments, Eutrophication, Plankton, Muds, Lake mud, Bioindicators.
Identifiers: *Esthwaite Water (England), English Lake District, Asterionella, Melosira,Cyclotella, Tabellaria.

The diatom flora of a core taken from the center of Esthwaite Water has been analyzed qualitatively and quantitatively. Five periods of deposition have been characterized by indicator species and variations in diatom productivity. The most recent brown lake muds (0-150 centimeters) contain Asterionella, Melosira, Cyclotella, and Tabellaria. Comparison with the present-day diatom flora suggests that a transition to eutrophic conditions, detected in late Post-glacial time, is still occurring. The main diatom zones show good association with the zoning derived from pollen analysis. (Bortleson-Wisconsin)

ISOLATION AND CULTURE OF TOXIC STRAINS OF ANABAENA FLOS-AQUAE (LYNGB.) DE BREB.,
National Research Council of Canada, Ottawa (Ontario).
P. R. Gorham, J. McLachlan, U. T. Hammer, and W. K. Kim.
International Association of Theoretical and Applied Limnology, Proceedings, Vol 15, p 796-804, February 1964. 1 fig, 3 tab, 22 ref.

Descriptors: *Algae, *Toxicity, *Cultures, *Isolation, Limnology, Public health, Physicochemical properties, Genetics, Bacteria, Peptides, Environmental effects, Heterogeneity, Iron, Manganese, Waterfowl, Cyanophyta.
Identifiers: *Anabaena flos-aquae, *Strains, Phycologists, Veterinarians, Microcystis aeruginosa, Endotoxin, Fast-death factor, Dosage, Species susceptibility, Anabaena Lemmermannii, Ottawa (Ontario), Burton Lake (Saskatchewan), Humboldt (Saskatchewan), Mice, Morphological characters, Tris.

Toxic waterblooms of planktonic blue-green algae have puzzled phycologists, limnologists, veterinarians, and public health officials for more than 80 years. The authors of this paper succeeded in isolating toxic and non-toxic strains of Anabaena flos-aquae from a toxic bloom in Burton Lake, Saskatchewan. Of fourteen strains isolated in 1960 and 1961, eight were toxic and six non-toxic. They showed, for the first time (although long suspected), that this alga can be poisonous. The fast-death factor produced is often secreted into the surrounding water. This and other properties of Anabaena very fast-death factor indicate that it is different from Microcystis fast-death factor. One sample collected in 1960 contained a very fast-death factor, killing mice in one to two minutes after intraperitoneal injection with a minimal lethal dose. Death was preceded by symptoms of paralysis, tremors, and mild convulsions. The salt concentrations giving best growth of one strain of Anabaena flos-aquae in unialgal culture bear little resemblance to those of the lake water from which it was isolated. Interesting changes in growth habit (gradual loss of colonial habit and filament coiling) were observed in culturing Anabaena flos-aquae, illustrating how variable some morphological characters can be. (Jones-Wisconsin)

CONTRIBUTION TO THE ECOLOGY OF WATER-BLOOM-FORMING BLUE-GREEN ALGAE -APHANIZOMENON FLOS AQUAE AND MICROCYSTIS AERUGINOSA,
Ceskoslovenska Akademie Ved, Prague. Hydrobiological Station.
J. Hrbacek.
International Association of Theoretical and Applied Limnology, Proceedings, Vol 15, p 837-846, Feb 1964. 8 fig, 2 tab, 6 ref.

Descriptors: *Algae, *Cyanophyta, *Ecology, *Eutrophication, Ponds, Reservoirs, Backwater, Fertilization, Nitrogen compounds, Phosphorus compound, Perches, Fish, Diatoms, Carp, Plankton, Metabolism, Biological communities, Daphnia, Nannoplankton, Nutrients, Depth, Domestic animals, Sampling, Nuisance algae.
Identifiers: *Aphanizomenon flos aquae, *Microcystis aeruginosa, Bohemia, Elbe River, Celakovice (Czechoslovakia), Blatna (Czechoslovakia), Cyprinid fishes, Clorococcales, Daphnia pulicaris, Daphnia cucullata, Daphnia hyalina, Daphnia magna, Czechoslovakia.

Knowledge of individual factors which either promote or inhibit water-bloom-forming cyanophytes (blue-green algae), Aphanizomenon flos aquae, and Microcystis aeruginosa is not extensive. This report is based on a comparative study of water-bodies in Bohemia. Ten backwaters in the inundation area of the Elbe River, six fish ponds, and three water reservoirs were sampled at monthly intervals from April to September. In order to examine the relative importance of nitrogen and phosphorus compounds from each of the three categories of water-bodies, the following were selected: one with water bloom consisting of Aphanizomenon with occasionally some Microcystis; one without water bloom, and, insofar as possible, one with Microcystis water bloom. In ponds, backwaters, and reservoirs with and without water blooms, no important differences in content of phosphorus and nitrogen compounds were found. In one bloom-containing reservoir, water showed significantly smaller concentrations of phosphorus compounds than in ponds. An association exists between cyanophytes and Daphnia. Depth had increasing effect on development of water bloom of these two cyanophytes. In ponds, increased fish stock accompanied decreased Aphanizomenon blooms, while in some waterbodies, larger fishstock was associated with development of Microcystis aeruginosa bloom. (Jones-Wisconsin)

PHYTOTOXICITY OF IMIDAZOLINE DERIVATIVES AND RELATED COMPOUNDS,
Wisconsin Univ., Madison. Dept. of Botany.
Seward E. Allen, and Folke Skoog.
Plant Physiology, Vol 26, p 611-624, 1951. 4 fig, 1 tab, 11 ref.

Descriptors: *Phytotoxicity, Agricultural chemicals, Herbicides, Weed control.
Identifiers: *Imidazoline derivatives, 1-isopropyl-4, 4-dimethyl-2-imidazolines.

Certain 1-isopropyl-4,4-dimethyl-2-imidazolines and other structurally related compounds were found to be toxic to seedlings and larger plants. Their toxic action apparently depends upon a ring nucleus containing carbon and nitrogen linked by double bonds, the lack of any polar substituents in the 4-position, and the length of an alkyl group in the 2-position; and may be due in part to their lipophilic properties. In the greenhouse, corn, wheat, and lambsquarter were fairly resistant; soybeans, table beets, peas, and red-root pigweed were moderately sensitive; and wild mustard, and tomatoes were readily killed by applications of a 0.50% spray. Because they are inactivated by contact with soil, these toxic imidazoline derivatives might be useful as pre-emergence herbicides. (Nichols-Wisconsin)

INFLUENCE OF ELECTRIC POWER PLANT ON LIMNOLOGICAL CONDITIONS OF RESERVOIRS (IN GERMAN),
Vysoka Skola Chemicko-Technologicka, Prague (Czechoslovakia).
V. Sladecek, and L. Fiala.
Verh Internat Verein Limnol, XIV, p 619-624, Stuttgart, July 1961.

Descriptors: *Reservoirs, *Stratification, *Limnology, Hydroelectric power, Peak power, Plankton, Phytoplankton, Zooplankton, Epilimnion, Hypolimnion, Thermocline.

The influence of peaking power plant in east Bohemia caused a second transition zone in the Pastviuy reservoir during summer. Therefore, the hypolimnion was divided into two parts. The water from the upper part of the hypolimnion went to the turbines, while the water from the lower part of the hypolimnion was stagnant and mostly anaerobic. The epilimnion and part of the metalimnion were not influenced by peak operating conditions, and thus, biological observations showed that plankton in the reservoir were unaffected. The temperature, D.O. content, and number of plankton in the flow control basin were very low, which was caused by the water discharged from the hypolimnion. (Novotny-Vanderbilt)

BIOCHEMICAL EFFECTS OF COOLING WATER DISCHARGE INTO PUBLIC WATERS (IN DUTCH),
Instituut voor Gezondheidstechniek TNO, The Hague (Netherlands).
J. K. Baars.
De Ingenieur, No 51, p G85-G88, Dec 20, 1968. 3 fig.

Descriptors: *Thermal pollution, *Power plants, *Aquatic life, Ground-water, Nitrification, Oxygen sag, Oxygen requirements, Waste assimilative capacity, Biochemical oxygen demand, Respiration, Aeration, Kinetics.
Identifiers: Fenol.

Thermal pollution of a body of water, as being caused by the disposal of cooling water, has various aspects which under certain conditions can be detrimental to aquatic life. The influence of temperature on the oxygen content of water and its reaction rate with organic materials are major factors. The BOD reaction rate is generally considered to be 4% greater per 1 deg C increase in temperature. Modern power plants have only an efficiency of 33%. The rest of the heat will have to be disposed of. During the summer, as a result of thermal pollution, the oxygen content of the river Thames near Teddington is insufficient for normal aquatic life. Cooling towers can be used in which part of the water evaporates. This results in concentration of organic materials and nitrification, which again can be detrimental to fish life. High temperature increases the rate of breakdown of fenols. If ground-water is used it is generally necessary to add oxygen and remove Fe, H2S, and CO2 before disposal. (Rietveld-Vanderbilt)

THE LIMNOBIOCHEMISTRY OF DEVILS LAKE, NORTH DAKOTA,
North Dakota Univ., Grand Forks.
Joe K. Neel, John W. Vennes, David W. Anderson, James D. Knauss, and Gary L. Buchli.
Completion Report, Sept, 1969. 18 p, 2 fig, 10 ref.

Descriptors: *Saline lakes, Limnology, Nitrogen, Phosphorus, Potassium, Sediments, *Plankton, *Benthos, Midges, Nekton, Salamanders, Bacteria.

Devils Lake, a highly mineralized remnant of a drying larger water body, has a high productivity that is enhanced by municipal wastes. Nitrogen and bicarbonate change with plankton growth and senescence, but this is not apparent for other nutrients. Nitrogen and phosphorus removed from water by phytoplankton are stored in and later released from bottom sediments. Potassium is more critical than nitrogen or phosphorus for algal growth. Sulfate reducing bacteria vary markedly on an annual basis with no significant changes in water chemistry, but nitrifiers and denitrifiers remain rather constant. Benthos m toto was most concentrated in areas with greatest phytoplankton productivity, but this was not true for several species. Midges are the major benthos component. Organic debris incorporated in sediments plays a minor role in benthos distribution. The three most numerous species were influenced by sediment particle size. Tiger salamanders are the most constant and largest nekton element, surviving sporadic oxygen depletions by having adults winter outside the lake. Neotenous forms are subject to 'winter kill', but are present most of the time, developing from eggs in one season. The role of neotenous forms in breeding and conditions governing their development are unknown. Salamanders suffer little predation.

EFFECT OF AN ACID-WATER ENVIRONMENT UPON THE SYNTHESIS OF GROWTH FACTORS (VITAMINS) BY BACTERIA,
West Virginia Center for Appalachian Studies and Development, Morgantown.
H. A. Wilson, and Keister L. Richardson, Jr.
OWRR Proj A-018-WVA. West Virginia Water Research Institute Information Report 1, 1969. 6 p, 9 ref.

Descriptors: *Acid mine water, Bacteria, *Acid bacteria, Water pollution sources, *Sewage bacteria.
Identifiers: *Bacteria growth, pH determinations.

Five bacterial isolates capable of growing in a synthetic medium with no vitamins or growth factors were used. Three of the isolates were obtained from Monongahela River water (an acid mine water-sewage polluted stream) and two from untreated domestic sewage. The minimum growth pH for two isolates was 3.7 and for the others it was 3.5. A synthetic medium was prepared, dispensed, and adjusted either to minimum growth pH or 0.2 unit below the minimum growth pH. To various portions of the medium amino acids, vitamins, fatty acids, peptone, yeast extract, soil extract, sterilized domestic sewage and a hydrolyzed protein were added singly and in combinations. Except for one combination of two additives, no increase in growth occurred at the minimum pH. With this combination better growth occurred at minimum pH level than in the control (no additives) with the five bacteria. There was some indication that one isolate growth was obtained in the presence of the additives at 0.2 pH unit below the previously determined minimum growth pH. pH determinations were made before and after medium modification, and before and after incubation to ensure no incorrect interpretations because of a pH shift.
W70-00312

STUDIES ON THE BLOOD MORPHOLOGY OF THREE ESTUARINE CYPRINODONTIFORM FISHES,
Federal Water Pollution Control Administration, West Kingston, R.I.
George R. Gardner, and Paul P. Yevich.
Journal of the Fisheries Research Board of Canada, Vol 26, 1969, p 433-447.

Descriptors: *Fish hematology, Hematology, *Morphology (Blood), Fundulus heteroclitus, *Estuarine fisheries, Estuarine environment.
Identifiers: *Blood cell morphology, Seasonal variation, Thrombocyte function, Stress indicators.

Specimens of Fundulus heteroclitus, Fundulus majalis, and Cyprinodon variegatus were bled in the field at the site of capture. Blood was obtained during all seasons and in the laboratory at intervals over a 30-day period from specimens held in two types of holding aquaria. The circulating blood elements of these three estuarine species consist of erythrocytes, small and medium lymphocytes, eosinophils, and thrombocytes. The observations were made using both stained and fresh blood preparations. Variations occurred seasonally in the morphology of erythrocytes, eosinophils, and thrombocytes. Cytoplasmic inclusions were visible in erythrocytes prior to, and at the beginning of, the new breeding season. There were changes in the refringent properties of thrombocytic and eosinophilic granules, and cyclic variations in the number of eosinophilic granules. Seasonal variations occurred in the ratio of immature to mature thrombocytes, but there was little overall variation in the ratios of leucocytic cell types. The thrombocytes were characterized by thrombocytic granulation and nuclear indentations. Thrombocytes were capable of altering their form; mature cells formed thrombocytic networks. The concentration of eosinophils gradually increased to 18% above the usual level in Fundulus heteroclitus held 30 days in 20-liter circular aquaria. The eosinophil level remained at the usual 2% specimens held in 189-liter aquaria for the same time period. Values for specimens captured in a natural environment were also 2%. It is therefore plausible to relate the rise in eosinophils with an environmental stress associated with the circular holding containers.

5D. Waste Treatment Processes

MODEL OF OPTIMAL COMBINATION OF TREATMENT AND DILLUTION,
Oklahoma Univ., Norman. Dept. of Civil Engineering and Sanitary Science.
George W. Reid, Leale E. Streebin, Robert Y. Nelson, and O. Tom Love.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, p 339-350, 1967. 12 p, 1 fig, 3 tab.

Descriptors: *Waste treatment, *Waste dilution, *Water quality control, *Optimization, Mathematical models, Systems analysis, Computer programs, Model studies, Costs, Economics, Streamflow, Water temperature, Biochemical oxygen demand.
Identifiers: Waste treatment-dilution optimization.

Models were developed to depict waste dilution flows used with projections of reservoir and treatment costs to provide optimal combinations of low flow augmentation and waste treatment. Projection of municipal and industrial loadings were developed on a nationwide data base using standard statistical methods. The study revealed mean and variances of strength and discharges. A similar study developed treatment efficiency matrices and corresponding treatment costs. These costs reflected scale effects, and were presented in terms of capital, operation, and maintenance costs. A novel technique employing micro and macro models and 'tunneling' procedure was used to disaggregate national values and to provide basin loading level forecasts. Stream input-output models were developed in terms of responses to impressed loads, characterized as biodegradable, nutritional, persistent chemical, and thermal. The models were developed as a function of stream parameters. The loads and stream resources were treated on a basin level in these macro level models. The model provides optimal or least cost combination of waste treatment and dilution. (Knapp-USGS)

ECONOMIC SIZING OF COOLING TOWERS,
Electricity Supply Board (Ireland).
A. G. Kelly, and N. R. Lawless.
Combustion, p 41-47, Aug 1962. 12 fig, 2 tab, 6 ref.

Descriptors: *Cooling towers, Weather charts, Thermal pollution, Thermal powerplants.
Identifiers: *Natural draft towers, Turbo-set heat consumption, Turbo-alternator efficiency, Cooling tower size, Weather analysis.

An accurate method of producing a weather specification for natural draft cooling towers is deduced. A size of cooling tower and condenser is chosen which will give the best value for money invested. The operating cooling water temperatures for every hour of the life of the plant are taken into consideration in the economics of choice of condenser and cooling tower. The analysis showed that the weather conditions are an effective 5 deg. to 7 deg. F more in favor of the tower than was heretofore thought. On first sight this might appear to make it economic to construct smaller cooling towers but, in fact, the opposite is true. Cooling towers give a good return in efficiency for extra investment; because towers are now known to produce colder water (and thus better heat consumption of the turbo-set) when actual average atmospheric conditions are fully analyzed, it is economic to build larger towers than heretofore. (Ross-Vanderbilt)

USUAL APPLICATIONS OF COOLING TOWERS,
Foster Wheeler Corp., San Mateo, Calif.
J. J. Finnerty.
Industrial Water and Wastes, p 187-190, Nov-Dec, 1961. 5 fig, 1 ref.

Descriptors: *Cooling towers, *Thermal pollution, Waste water (Pollution), Heated water, Water reuse.
Identifiers: Counterflow cooling tower, Standby cooling tower, Salt water cooling.

That cooling towers efficiently and effectively conserve water while removing waste heat, both paramount objectives of industry is emphasized. Recent industrial expansion has created new and diverse cooling tower applications, three of which are described, all induced-draft counterflow cooling towers. In the first, salt water, rather than fresh, is cooled in the tower. The second tower, serving a condenser, in effect cools the river from which the circulating water is drawn. In the third application, the tower is used as a process instrument, removing excess heat from a waste flow to enable biological treatment. Details of these applications are given. (Ross-Vanderbilt)

COOLING WATER FOR STEAM ELECTRIC STATION ON TIDEWATER,
Southern California Edison Co., Los Angeles, Calif.
R. W. Spencer, and John Bruce.
Journal of the Power Division, Proceedings of the American Society of Civil Engineers, Vol 86, No PO 3, p 1-26, June 1960. 23 fig.

Descriptors: *Electric power plant, *Cooling water, *Tidewater, Thermal pollution, Calfiornia.
Identifiers: Steam electric station, Steam generating station.

A number of tidewater installations mostly in California are briefly reviewed in lieu of analysis of the detail of mechanical and hydraulic features of cooling water systems. Sites include: Mandalay, El Segundo, Long Beach, Redondo, Huntington Beach, Alamitos, Pittsburgh, Moss Landing, Morro Bay, Hunters Point, Contra Costa, Humboldt Bay, Encina (Carlsbad), Silvergate, Seal Beach, Los Angeles Harbor. Although the availability of cooling water has been a major factor in the selection of plant sites, the designer is usually faced with making a choice of several alternate cooling water arrangements after the site is purchased. There has been a steady improvement in the design of cooling water systems over the past 30 years. Desirable station sites are becoming difficult to obtain in many areas. A variety of methods have been used successfully in meeting operating problems encountered, such as sand movement, marine growth control, and fish destruction. (Ross-Vanderbilt)

ACTIVATED SLUDGE TREATMENT OF CHROME TANNERY WASTES, A Pilot Study of Treating Combined Chrome Tannery Wastes and Domestic Sewage.
Lawrence (A. C.) Leather Co., South Paris, Maine.

Available from the Clearinghouse as PB186 158. $3. in paper copy, .65 cents in microfiche. Water Pollution Control Series, FWPCA Report ORD-5, Sept 1969. 174 p, 48 tab, 36 fig, 13 ref, append. Grant No WPRD 133-01-68. FWPCA Program No 12120.

Descriptors: Pilot plants, Chromium, Sulfides, *Waste treatment, Industrial wastes, *Municipal wastes, Sludge, *Activated sludge.
Identifiers: *Tannery wastes.

The A. C. Lawrence Leather Company tannery at South Paris, Maine is a chrome side upper leather tannery. About 220 people are employed at the tannery and about 2,500 hides are processed each day. The water use at the tannery is about 1.0 mgd. Each day the waste discharged from the tannery contains about 8,500 lbs of 5-day, 20 deg C BOD, 70,000 lbs of total solids, of which about 17,000 lbs are suspended and 53,000 lbs are dissolved. The pH of the wastewater varies from 5.0 to 12.0. The daily waste discharge also contains about 8,000 lbs of calcium, as $CaCO_3$, 300 lbs of sulfides, and 1,800 lbs of chromium. A waste treatment process was developed and tested, in pilot plant scale, for the treatment of the tannery wastes in combination with municipal sewage. The process consisted of the following steps in the order employed; equalizing and mixing of the alkaline and acid wastes; primary sedimentation; carbonation followed by upflow sedimentation; addition of screened municipal sewage; activated sludge treatment and secondary sedimentation of the mixed wastes; and chlorination. The sludges resulting from the treatment of the wastes and sewage were dewatered by centrifuge and were found to be suitable for burial. Design factors for the various steps of the process were developed and are presented in the attached report. Studies were made of the fundamental systems and reactions which form the bases for the processes employed in the pilot plant. The results of the pilot plant investigation indicate that by use of the methods recommended, mixtures of chrome tannery wastes and municipal sewage can be treated successfully. It may be anticipated that by the employment of the methods recommended, that mixtures of tannery wastes and municipal sewage can be treated to remove more than 90 percent of the BOD and suspended solids together with about 65 percent of the total solids. Furthermore, the treatment will remove or convert 99 to 100 percent of the sulfides, remove about 97 percent of the chromium and about 65 percent of the calcium. Chlorination of the effluent will reduce the coliform bacteria concentration to less than 100 per 100 ml. The processes recommended are conventional sewage treatment unit processes, with the exception of carbonation and solids contact sedimentation. Modification of conventional equipment will be necessary to accommodate the special characteristics of tannery wastes. Fine screening will be needed to remove hair. Calcium carbonate incrustation of equipment, especially screens and carbonation equipment, will have to be considered. Extra strength sludge collection and pumping equipment will be needed since the sludges are large in quantity and are denser than sewage sludges.
W70-00163

RECOVERING THE KINETIC ENERGY OF A FALLING LIQUID IN A COOLING TOWER,
Central Electricity Generating Board, London (England). Central Electricity Research Labs.
L. O. Wild.
CEGB Technical Disclosure Bulletin, No 41, Nov, 1964. 3 p, 3 fig.

Descriptors: *Cooling towers.
Identifiers: *Kinetic energy, Velocity component.

This report is based on the work carried out at CEGB, U. K. on the recovery of energy from cooling towers and is useful for typical large cooling towers where water might have to fall 30 feet. If the liquid from a cooling tower is allowed to fall onto a flat surface, all the kinetic energy is dissipated as heat. If a cone is used in place of a flat surface the liquid will run down the surface in radially outward direction and could be collected in a culvert around the base of the cone, but the acquired kinetic energy would be destroyed against the wall of the cone. If the cone is modified so that the semi-angle of the cone is gradually increased as one goes round the surface of the cone then at any point the line of greatest slope is no longer radial but has a circumferential component. The culvert would have a slope and cross-section to suit the flow and velocity required. To maximize circumferential component of velocity the apex of the cone would preferably be at the maximum possible height. (Upadhyaya-Vanderbilt)
W70-00316

REDUCED PUMP HEAD CROSSFLOW COOLING TOWERS,
Central Electricity Generating Board, Leatherhead (England). Central Electricity Research Labs.
D. G. Christie.
CEGB, Technical Disclosure Bulletin, No 106, May, 1968. 3 p, 1 fig.

Descriptors: *Cooling towers.
Identifiers: *Crossflow cooling tower, *Pump head, Thermal design, Pump power.

It is shown that by splitting the packing of a cross flow cooling tower into two sections vertically one above the other, a saving of up to 40% of the tower pumping head can be achieved. It is shown that required pump power in case packing is (40+ Y1+ 1/2 H) W. ft lb/hr and the corresponding value for the single packing is (40+ Y2) W. ft lb/hr. Y2 and Y1 are the height of the tower in non-splitting and splitting the packing, H is head (2-3 ft) required to allow for the flow resistance in downcomer from the upper packing and W is the total water flow in lb/hr through the tower. Taking practical values of 66 and 37 ft. for Y2 and Y1, the saving in pumping head for the split pack tower is 28 ft. The overall packing height must be increased to maintain the thermal performance, but the capital cost of the tower is substantially the same since a thinner packing is technically acceptable. 5E. Ultimate Disposal of Wastes

EVALUATING SANITARY LANDFILL SITES IN ILLINOIS,
Illinois State Geological Survey, Urbana.
Keros Cartwright, and Frank B. Sherman.
Ill State Geol Surv Environ Geol Note No 27, Aug 1969. 15 p, 3 fig, 13 ref.

Descriptors: *Landfills, *Environmental sanitation, *Illinois, *Hydrogeology, Sanitary engineering, Waste disposal, Geology, Groundwater movement, Surface waters, Glacial drift, Aquifers, Aquicludes.
Identifiers: Illinois sanitary landfills.

Criteria for the suitability of sites for sanitary landfill in Illinois are listed and discussed. Both surface water and groundwater must be protected from leachates containing large organic and bacterial loads. Landfills should be located in relatively impermeable material so that leachate movement is retarded. Clay, shale, silt, and glacial till are the most common materials with low permeability in Illinois. At least 30 ft of impermeable material is required between the bottom of a landfill and the shallowest aquifer. Choice of proper site topography is important in avoiding surface drainage contamination. Limestone or dolomite quarries and most sand and gravel pits make poor landfill sites because these materials are usually good aquifers. Swampy areas also make poor sites unless they are properly drained to prevent disposal into standing water. Strip mines, clay pits, and gravel pits containing gravel with a high percentage of natural clay binder (the type that is often used for grading county roads) do make good disposal sites if kept dry. Flat upland areas also are good potential sites if the required natural clay barrier is present above any aquifer. The careful selection of a landfill site will result in a minimum of operating problems and little, if any, danger of groundwater or surfacewater pollution. (Knapp-USGS)

DISPOSAL OF WASTES FROM WATER TREATMENT PLANTS.
American Water Works Association Research Foundation, New York.

Available from the Clearinghouse as PB186 157, $3. in paper copy, .65 cents in microfiche. Water Pollution Control Series, FWPCA Report ORD-2, Aug, 1969. 184 p, 7 tab, 30 fig, 195 ref, subject index. Project No WP1535-01-69. FWPCA Program No 12120 ERC.

Descriptors: *Waste disposal, Waste treatment, *Water treatment, Sludge treatment, Ultimate disposal, Operation and maintenance, *Cost analysis, Regulation, Surveys, *Utilities, Water works.

This report is an intensive study of the disposal of wastes from water treatment plants. The wastes include filter washwater; sludge resulting from coagulation, softening, iron and manganese removal processes; diatomaceous earth filtration; and ion exchange brines. The control of pollution from these wastes is a high priority problem for the water utility industry. A series of four status reports describe in detail what is known of the research, engineering, plant operation, and regulatory aspects of the problem. A special report reviews current technology and analyzes costs of disposal methods, based on data collected from fifteen operating plants. A conference was organized to provide expert evaluation of each report and to extend the data available. Final reports were prepared by committees of conference participants to identify future needs for information in each aspect of the waste disposal problem. These reports recommend substantially expanded programs of research and demonstration. They include extensive lists of specific problems which must be investigated to develop effective and economical technology. Committee reports also recommend establishment of a central service to promote the planning of research and development, and to implement effective programs of new or improved technology. The service would collect, coordinate, and disseminate data on all aspects of water treatment plant waste disposal problems.

CITY OF MARYVILLE V CUSHMAN (RIGHT TO CHARGE FOR SEWAGE DISPOSAL).
249 SW2d 347-356 (Mo 1952).

Descriptors: *Missouri, *Local governments, *Water rates, *Waterworks, Sewage disposal, Sewerage, Utilities, Sewers, State governments, Judicial decisions, Remedies, Legal aspects, Financing.

Pursuant to the authority granted by an act of the Missouri legislature, the city of Maryville combined its waterworks and sewerage systems. In a special election, it chose to issue and sell revenue bonds to defray the cost of improving and extending this combined system. The bonds and interest were to be paid out of the funds collected for the use of the combined system. A group of taxpayers, water users and sewer users filed a petition praying that the bonds be held invalid. Following a decree finding the bonds valid, they appealed. The court affirmed this decree. It held: (1) that respondent could charge for the use of the sewerage system regardless of whether such system had previously been maintained through taxes; (2) that respondent could legally make an owner liable for the water and sewerage services rendered to a tenant on the owner's premises; and (3) that respondent was authorized to discontinue water service upon a failure to pay the fixed charges within a reasonable time. 5F. Water Treatment and Quality Alteration

OCEAN COOLING WATER SYSTEMS FOR TWO THERMAL PLANTS,
Department of Water and Power, Los Angeles, Calif.
L. T. Mariner, and W. A. Hunsucker.
Journal of Power Division, Proceedings of the American Society of Civil Engineers, Vol 85, No PO 4, Aug 1959. 21 fig.

Descriptors: *Thermal power plants, *Cooling water, Design, Construction, Dewatering, Flood protection, Fish repellent.
Identifiers: Los Angeles, Scattergood Steam Plant, Haynes Steam Plant.

Varied problems are compared associated with the design and construction of circulating water facilities for two coastal themal plants to serve the city of Los Angeles. Widely differing locations pose diverse design problems of sanding, erosion, and navigational requirements. Construction dewatering problems are illustrated and discussed. The Scattergood Steam Plant on Santa Monica Bay and the Haynes Steam Plant are compared. The circulating water system for the Scattergood Cooling Plant is designed for cooling the first four power units. Although space is provided for a six-unit plant, it is estimated that there will be major changes in the design of thermal generating units before the last two are required. At the Haynes Plant cooling water will pass through substructures under the San Gabriel River and Pacific Coast Highway into an open channel leading to the plant site. Integrated screening and pumping facilities for the ultimate development are not contemplated for this plant. Each unit or pair of units will have a separate installation for this purpose. (Ross-Vanderbilt)

COMMUNITIES OF OVER 1000 POPULATION WITH WATER CONTAINING IN EXCESS OF 1000 PPM OF TOTAL DISSOLVED SOLIDS.
Black and Veatch, Kansas City, Mo.

Office of Saline Water Research and Development Progress Report No 462, October 1969. 49 p. OSW Contract 14-01-0001-1777.

Descriptors: Chemical analysis, *Water quality, *Municipal water, Domestic water, *Public health.
Identifiers: Substandard quality water supplies, *Total dissolved solids.

The report presents listings by states and by water resource regions of the community water systems, 420 in number for the United States, having reported water supplies with high mineral content. The listings are restricted to communities of population 1,000 or over, and to supplies containing 1000 ppm of TDS or over. For 284 of the communities, all sources feeding into the water supply have over 1000 ppm of TDS. The 420 communities listed represent a 1960 population in excess of 2,770,000. (Bovet-Office of Saline Water)

5G. Water Quality Control

CONTROL OF MINE DRAINAGE WATER,
Pennsylvania State Univ., University Park. Dept. of Mineral Preparation; and Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
Harold L. Lovell, and Bruce E. Jones.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 578-587, 1967. 10 p, 4 fig, 2 tab.

Descriptors: *Acid Mine water, *Water pollution control, Waste water treatment, Neutralization, Ion exchange, Biodegradation, Oxidation, Water pollution treatment, Abatement, Water quality control, Pilot plants.
Identifiers: Acid mine drainage control.

Coal mine drainage creates a stream contamination problem which currently plagues several eastern states. It introduces iron, aluminum, and sulfate ions as well as sulfuric acid into receiving streams and frequently produces unsightly sediments on stream bottoms. These constitute an environment which is generally incompatible with aquatic life, recreational use, and industrial water requirements. Such pollution develops naturally under proper environmental conditions but is enhanced by mining operations. Recently adopted state laws and regulations require immediate and extensive remedial action in certain areas. Corrective approaches to these pollution conditions include prevention of its formation, amerioration, diversion to areas where the contamination might be less innocuous and water treatment for removal of the contaminants. At the present time, one of the approaches being taken by the Pennsylvania State University is the construction of a versatile experimental plant for treating such waters. This plant will be capable of treating half a million gallons of water per day and will utilize 6 separate neutralization flow paths. Such data are essential to obtain the economic information for optimizing design and operational procedures. (Knapp-USGS)

POLLUTION OF STREAMS--SEWAGE DISPOSAL PLANTS.
Ind Ann Stat sec 48-4207 (1963).

Descriptors: *Indiana, *Pollution abatement, *Sewerage, *Pollutant identification, Legislation, Legal aspects, Streams, Sewage disposal, Cities, Rivers, Drainage, Watercourses (Legal), Drainage systems, Public health, Public benefits, Structures, Pumping plants, Specifications, Right-of-way, Investigations, Construction, Financing, Drains, Sewers, Environmental sanitation, Water pollution, Waste disposal, Sanitary engineering.
Identifiers: *Sewage disposal plants.

When the Board of Sanitation Commissioners of any city located on or near any watercourse finds upon investigation that such watercourse is being polluted by sewage or drainage system discharge from such city, it must determine whether the construction of a sewage disposal system is necessary for the public health and benefit. If a new disposal system is deemed necessary, the board prepares maps, plans, specifications, and drawings for the proposed plant together with an estimate of the installation costs of the plant and all structures incident thereto. The board must also prepare a description of all property rights to be acquired in connection with such plant whether such rights are to be obtained by purchase or appropriation. The board must then propose a resolution incorporating the findings of its original investigation as well as all pertinent maps, plans, specifications, and descriptions. The procedures for adoption of the resolution, financing the plant, having public hearings on the resolution, and acquiring the necessary property are all specifically set out. (Keith-Florida)

INTERSTATE WATER SANITATION BOARD.

Ky Rev Stat Ann secs 224.205, 224.210 (Supp 1968).

Descriptors: *Kentucky, *Interstate compacts, *Water pollution control, *Interstate commissions, Legislation, Basins, Rivers, Interstate rivers, Ohio River, Administrative agencies, Legal aspects.
Identifiers: *Water sanitation.

An Interstate Water Sanitation Board is established. The members of the Board shall serve as Kentucky's members of interstate water sanitation control commissions created by compacts to which Kentucky is a party, which compacts are composed of states forming a river basin, and which compacts require a three-member representation from each state. The interstate water sanitation control commissions created by such compacts shall have all the powers provided for in the respective compacts, and all the powers necessary or incidental to the carrying out of the compacts in every particular. Any powers granted to the commissions by this section shall be regarded as in aid of and supplimental to and not as a limitation upon any of the powers vested in the commissions by other laws of this state or by the laws of any of the states party to any of the compacts, or by Congress, or by the terms of the compacts. (Heckerling-Florida)

DUTIES OF THE DEPARTMENT OF CONSERVATION.

Ind Ann Stat secs 60-718 thru 60-720 (1962).

Descriptors: *Water conservation, *Indiana, *Wildlife conservation, *Water pollution control, Legislation, Legal aspects, Drainage, Eminent domain, Lakes, Streams, Springs, Water pollution, Sewage disposal, Regulation, Administrative agencies, Conservation, Navigable waters, Fish, Permits, Beds, Public health, Public utilities, Riparian rights, Riparian land, Right-of-way, Parks, Fish management, Fish conservation, Fish reproduction.
Identifiers: *Penalties (Criminal).

The duties of the department of conservation are: to employ convicts for the purpose of draining lands acquired by the state for parks; to investigate lakes, streams, and springs for the presence of pollution and to prevent further pollution by the promulgation of necessary regulations; to have general charge and supervision of the navigable waters of the state; and to issue permits for the taking of minerals from or under the bed of any of the navigable waters of the state when the operations under such permit will not impede navigation or endanger any public structures or the property of any riparian owner. All lands owned by the state which are adjacent to any lake or stream are placed under the control and management of the department of conservation, except that the state reserves the right to convey rights of way to public utilities. The division of fish and game has the following duties: examination, testing, and carrying out methods for fish and game reproduction; acquisition or construction of equipment for the foregoing duty; and enforcement of wildlife protection laws. (Keith-Florida)

SOME ASPECTS OF THE PROBLEM OF MIXING OF POLLUTED WATER AND SELF-PURIFICATION OF STREAMS (IN RUSSIAN).
Gosudarjtvennyi Geologicheskii Institut, Leningrad (USSR).
A. V. Karaushev.
Materialy po voprosam samoochishcheniya vodoyomov i smeshcheniya stochnikh vod, Tallinn Pol Inst, p 5-27, June 7-10, 1965. 24 ref.

Descriptors: *Turbulence, *Mixing, *Waste dilution, Water pollution, Mathematical models, Hydraulic models, Mass transfer, Waste water (Pollution).
Identifiers: Turbulent mixing coefficient, Wind effect.

Applicability of sediment movement laws to the problems of waste dilution in streams is discussed and a new approach developed. The solution to the waste dilution problems is based on Makkareev's formula of turbulent diffusion in streams. Including wind effect in computation of the turbulent mixing coefficient for reservoirs and lakes is proposed, and an analytical approach presented. Uses of hydraulic models and problems of model similarity for dilution of waste waters in streams are discussed in the end of the paper. (Novotny-Vanderbilt)

PANTHER COAL CO V LOONEY (MINE WATER POLLUTION).

185 Va 758, 40 SE2d 298-305 (1946).

Descriptors: *Virginia, *Acid mine water, *Riparian rights, *Water pollution, Judicial decisions, Acidity, Corrosion, Water pollution effects, Coal mine wastes, Effluents, Mine acids, Mine wastes, Water pollution sources, Reasonable use, Water rights, Riparian land, Acid streams, Mine drainage, Percolating water, Water law.

Plaintiff is lower riparian land owner. Defendant coal company mines upper land upon which the stream flowing through plaintiff's land arises. Seeping and percolating mine water flows naturally into the stream. The mine water contained acids and minerals sufficient to injure and kill vegetation. Plaintiff claims that the stream and water wells located on his land were damaged. An upper riparian owner does not have a legal right to pollute to a material degree the stream running through a lower owner's land. The lower owner has a cause of action only when an unreasonable use of land and water by the upper land owner renders the water flowing into his land unfit for the use for which it had once been suitable and actually put. The court found the defendant not liable because the plaintiff had caused stream pollution himself and was unable to prove what proportion of the pollution was attributable to defendant. (Helwig-Florida)

WATER POLLUTION CONTROL.
Vt Stat Ann Tit 10, secs 901-918 (1958), as amended, (Supp 1968).

Descriptors: *Vermont, *Water pollution, *Water pollution control, *Classification, Legislation, Legal aspects, Recreation, Irrigation, Navigation, Pollution abatement, Reservoirs, Water resources, Permits, Water quality, Drainage, Cities, Rivers, Streams, Ponds, Lakes, Springs, Surface waters, Swimming, Watersheds (Basins), Water utilization, Sewage, Water supply.
Identifiers: Agricultural uses, Penalties (Criminal).

'Pollution' is the placing in the waters of the state of any noxious or deleterious substance which is likely to create a nuisance or which renders such waters harmful to animal or aquatic life or unfit for domestic, commercial, industrial, or recreational uses. The terms 'waters' includes artificial and natural bodies of surface water within the state. Water is classified as follows: class A water is suitable for public supply with disinfection and is of uniformly excellent character; class B water is suitable for bathing, recreation, irrigation, agricultural uses, and is acceptable for public supply with filtration and disinfection; class C water is suitable for recreational boating, wildlife habitat, and other specified uses; and class D water is suitable for power, navigation, transportation of sewage, and other specified uses. To implement compliance with the New England Interstate Water Pollution Control Compact and to effectuate a program for the prevention, control, and abatement of pollution, it is specified which state waters fall into each of the foregoing categories. A permit is required to create or maintain a source of pollution. The manner of the regulation, administration, and enforcement of the classification system is specified. (Keith-Florida)

CHICAGO SANITARY DISTRICT.

Ill Ann Stat ch 42, secs 326, 326aa, 326bb, 329a, 330, 336, 337, 339, 341, 342, 344-349, 351, 352, 354-359 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Sewage treatment, *Drainage systems, *Water pollution, Legislation, Administration, Administrative agencies, Drainage, Municipal wastes, Sewage disposal, Cities, Pollution abatement, Treatment facilities, Channels, Channel improvement, Engineering structures, Sewage, Waste water (Pollution), Assessments, Water resources, Eminent domain, Flood control, Regulation, Permits, Water control.
Identifiers: *Sanitary districts.

The authority of sanitary districts includes jurisdiction over drainage, sewage, and treatment works within their respective territories. Districts are charged with prevention and abatement of pollution by establishing standards, requiring permits for construction of municipal sewage systems and for changed systems, and initiating court action against violators. Financing of projects may be through sale of bonds. Authority of districts includes building docks, highways, bridges, approaches, and other works related to drainage canals and channels, and existing waterways may be improved to facilitate drainage. Districts have the power of eminent domain in most instances and are held liable for all damage caused by improvements. Specifications are made for size and capacity of sewage and drainage watercourses, for restrictions on the type of sewage discharge allowed, and for connecting facilities between districts. Districts which violate the act are subject to court action initiated by the Attorney General. Municipalities are required to share water sources that have been saved from pollution with other cities. There is provision for inspection of new channels. The city of Chicago is organized as a drainage district, and the statutory powers are conferred on the corporate authorities. (Douberley-Florida)
W70-00171

CHICAGO SANITARY DISTRICT.

Ill Ann Stat ch 42, secs 326, 326aa, 326bb (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Sewage treatment, *Drainage, *Sewage disposal, *Pollution abatement, Sewage, Sewage effluents, Waste water (Pollution), Surface drainage, Sewers, Regulation, Permits, Water control, Wastes, Municipal wastes, Waste water disposal, Waste water treatment, Cities, Docks, Water pollution, Water pollution treatment, Impaired water quality, Pollutant identification, Standards, Treatment facilities, Water quality.
Identifiers: *Sanitary districts.

Sanitary district trustees provide for drainage of surface water and sewage as well as for sewage disposal and treatment works. They also establish docks adjacent to navigable drainage channels, establish rates and charges therefore, and control water power which is incidentally created in the construction and use of channels, but do not control water after it passes the district's facilities. The Board of Trustees may prevent pollution of any source of water supply by mandamus or injunction proceedings. The Board may require municipalities to submit plans and specifications for approval before construction of sewers connecting with those of the district. The Board of Trustees determines what discharges constitute pollution and establishes standards within those set by the Sanitary Water Board. The Board has a duty to determine ways and means of removing and abating pollution. A permit from the Board is required for installation of any sewage system that discharges wastes into district waters and for changes in systems of large municipalities. When pollution occurs the Board may order discharge discontinued after notice and hearing. (Douberley-Florida)
W70-00172

CHICAGO SANITARY DISTRICT.

Ill Ann Stat ch 42, secs 329a, 330, 336, 337, 339 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Sewage disposal, *Engineering structures, *Drainage systems, *Sewage, Drainage, Sewers, Financing, Docks, Channels, Canals, Condemnation, Eminent domain, Condemnation value, Right-of-way, Channel improvement, Drainage water, Treatment facilities, Bridges, Cities, Compensation, Highways.

Sanitary districts may construct or improve sewage or drainage systems in a particular locality and finance the improvements through the sale of bonds. Specifications are provided for issuance of bonds. Districts may build and maintain highways along canals and channels where it is necessary to make dock property owned by the district accessible for use. These highways may be conveyed or released to the state. After proper proceedings, districts may condemn and acquire private property which is necessary to make improvements authorized by this chapter. Districts may acquire rights-of-way over public property and may improve any waterway, canal, lake, or other waters, including straightening of watercourses used for drainage. Plans for improvements must be approved by the Department of Public Works and Buildings. Districts may acquire existing sanitary facilities, but only by means other than condemnation. Provisions are made for bridges over certain channels, approaches, viaducts, subways, roadways, and sidewalks. These structures are to be turned over to municipalities if within their corporate limits. Districts are liable for any damage caused by any improvements, provided the district concerned is notified prior to suit. (Douberley-Florida)
W70-00173

CHICAGO SANITARY DISTRICT.

Ill Ann Stat ch 42, secs 341, 342, 344-347 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Channel improvement, *Drainage systems, *Waste water (Pollution), Channel flow, Drainage, Drainage practices, Sewage, Channels, Navigation, Navigable waters, Regulation, Sewers, Waste water disposal, Impaired water quality, Assessments, Taxes, River flow, River regulation.

Any channel or outlet discharging sewage into waters outside the sanitary district which constructed it must be of a specified size and capacity. Discharges must be such that the waters will be free of solids and will not be offensive or injurious to health. The Attorney General may institute suit against any district not complying with the act. Districts may levy an emergency tax if necessary to comply with improvements or changes decreed by the court. Minimum capacity is set for channels that divert Lake Michigan waters into various rivers, and districts have authority to remove obstructions in those rivers to prevent overflowing. Existing power rights are not affected. Channels are under the control of the general government for navigational purposes. Any district may provide for works in the Great Lakes or in connecting watercourses outside its territory for purposes of complying with the act. Districts may agree on terms and conditions for drainage from outside territories into its channels and for use of outside drains or channels. Specifications are established for the united flow from two districts. (Douberley-Florida)
W70-00174

CHICAGO SANITARY DISTRICT.

Ill Ann Stat ch 42, secs 348, 349, 351, 352, 354-359 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Channel improvement, *Flood control, *Drainage systems, *Water control, Cities, Costs, Cost-benefit theory, Cost allocation, Water quality, Water resources, Water supply, Channels, Inspection, On-site investigations, Testing, Condemnation, Eminent domain, Bridges, Cutoffs, Flood routing, Dams, Diversion structures, Water pollution treatment, Right-of-way, Maintenance.

Any municipality whose water source will be saved from pollution by construction of facilities under this act shall provide water to other municipalities as needed at the same rates charged other customers, unless facilities must be built outside its corporate limits and a higher rate is justified. No water or sewage may be admitted to a newly constructed channel before a board of commissioners certifies it to be in accordance with the provisions of this act. Sanitary districts may acquire land by purchase or eminent domain for the widening and deepening of streams which are to be used as channels. Bridges may be constructed where made necessary by such improvements. The City of Chicago is organized as a sanitary district, and the powers conferred by the act are conferred on the corporate authorities. They are authorized to construct a cut-off drain to divert flood water into Lake Michigan and to construct certain dams. Corporate authorities have the power to acquire property and rights-of-way necessary for the maintenance of authorized works. Cost of improvements is defrayed by assessing property within the district that is benefitted by the improvement. (Douberley-Florida)

STRIP MINING.

Ky Rev Stat Ann secs 350.020, 350.050, 350.060, 350.085, 350.090, 350.093, 350.100, 350.170, 350.240, 350.990 (1963), as amended, (Supp 1968).

Descriptors: *Kentucky, *Strip mines, *Mine drainage, *Strip mine wastes, Acid mine water, Cooling water, Fouling, Impaired water quality, Landfills, Mining, Pollutants, Public health, Soil contamination, Waste water, Water pollution sources, Water pollution effects, Seepage, Erosion, Sedimentation, Soil conservation, Drainage systems, Erosion control, Flood protection, Pollution abatement, Permits, Legislation.
Identifiers: *Anti-pollution legislation, Mining regulations, Penalties (Civil), Penalties (Criminal).

A Reclamation Commission was created to rigidly enforce regulation of and supervision of strip mining after findings that unregulated strip mining of coal counteracts efforts for soil and water conservation and causes erosion, pollution, and flooding. The Commission is given broad discretionary power to investigate, research, inspect, and rule upon issues created in this chapter. Permits are made necessary for strip mining in the state and applications for such permits must include a map of the course to be taken by drainage from the mine. If the mining project constitutes a hazard to streams or lakes in the area or is within one hundred feet of any public stream or lake, the permit will be denied. A proposed reclamation plan, including measures to eliminate damages to public property from erosion, pollution, and flooding, must be submitted and carried out by complete backfilling within twelve months after the permit has expired. These same requirements may be adopted for the mining of clay. Penalties, both civil and criminal, are proposed for any violation of the provisions of this chapter. (Schram-Florida)

TENNESSEE RIVER BASIN WATER POLLUTION CONTROL COMPACT.

Ky Rev Stat Ann sec 224.195, 224.200 (Supp 1968).

Descriptors: *Water pollution, *Kentucky, *Interstate compacts, *Tennessee River, Rivers, Water pollution control, Pollution abatement, River basin commissions, Administration, Administrative agencies, Legislation, Legal aspects, Governments, State governments, Water treatment, Standards, Water quality, Water pollution, Regulation, Sewage treatment, Water utilization.

The purpose of this compact is to promote effective control and reduction of pollution in the waters of the Tennessee River Basin through increased interstate cooperation. A district consisting of the area drained by the Tennessee River is created and a commission is established to manage, plan, inspect, render advise, and draft legislation concerning pollution in the river basin. The Commission shall prescribe regulations designed to further this compact. Although no single standard for sewage treatment or water quality will be appropriate for all situations, the Commission shall establish those standards that are best suited to the area involved

and the use of the water. The individual member states will work to establish water treatment programs designed to meet these standards. Also, any state pollution control agency may certify to the commission an alleged violation of the existing standards. After hearing, the Commission shall recommend appropriate measures to the state agency. If the violation does not cease, then the Commission holds further hearings and may order compliance with their findings. These orders may be enforced in the appropriate courts by specific relief suits. (Darragh-Florida)

TORTS - NUISANCE: INTERESTS WHICH WILL SUSTAIN A NUISANCE ACTION,
B. E. Ross.
Ark L Rev, Vol 19, No 3, p 407-409, Fall 1966. 3 p, 28 ref.

Descriptors: *Arkansas, *Riparian rights, *Water pollution, *Commercial fishing, Judicial decisions, Water users, Pollution abatement, Remedies, Damages, Streams, Non-navigable waters, Fishkill, Land tenure, Water pollution sources, Water pollution effects, Water pollution control.
Identifiers: *Nuisance (Public), *Nuisance (Private).

In Carson v Hercules Powder Co, 402 S.W. 2d 640 (1966), plaintiff, a commercial fisherman, had permission from the riparian owners to fish along a non-navigable stream. It was established that defendant polluted the stream, killing the fish, and preventing plaintiff from continuing his fishing. The Arkansas Pollution Control Commission had previously found defendant's pollution to be a public nuisance and had enjoined further pollution. Plaintiff asked for damages and injunctive relief. The trial court held testimony insufficient to justify an injunction and denied damages. The appellate court reversed and remanded, holding plaintiff entitled to damages for loss of earnings and damages to his business. The problem in this case concerns the types of interests which will sustain an action for nuisance. Unless the plaintiff has some interest in the property affected, he may not prevail in a private nuisance action. Any interest which can be deemed a property right will support the action. The action in the principal case might have been sustained on either a private nuisance or private action for a public nuisance theory. The court apparently adopted the plaintiff's contention that he was a tenant at the will of the riparian owners, and therefore had the requisite possessory interest to sustain the action. GROUNDWATER STUDIES--CHICAGOLAND DEEP TUNNEL SYSTEM,
Harza Engineering Co., Chicago, Ill. Water Resources Planning Div.; and Metropolitan Sanitary District of Greater Chicago.
Istavros S. Papadopulos, William R. Larsen, and Forrest C. Neil.
Ground Water, Vol 7, No 5, p 3-15, Sept-Oct 1969. 13 p, 16 fig, 4 tab, 10 ref.

Descriptors: *Water storage, *Hydrogeology, *Storm runoff, *Cities, *Illinois, Waste water treatment, Waste water disposal, Groundwater, Water levels, Seepage, Discharge (Water), Hydrologic data, Aquifers, Pumped storage, Analog models.
Identifiers: *Chicago Deep Tunnel Plan.

The Deep Tunnel System planned by the Metropolitan Sanitary District of Greater Chicago will provide flood and pollution control for the combined sewer areas of the Chicago region. Elements of the Deep Tunnel System that are of main concern to the groundwater resources of the area are the conveyance tunnels and the mined storage reservoir which will convey and store polluted storm-water overflows. The Silurian and the Cambrian-Ordovician aquifers, in units of which these elements will be located, will be protected from any deleterious effects of the System by ensuring that a positive hydraulic head, causing an inward flow, is continuously maintained around the tunnels and the mined reservoir. In the Cambrian-Ordovician aquifer, this necessitates that groundwater levels are maintained by artificial recharge. Extensive groundwater studies were conducted to (1) demonstrate the feasibility of aquifer protection by recharge, (2) determine the needed amounts of recharge water, and (3) estimate the seepage of groundwater into the tunnels and mined reservoir. The studies included field investigations, analog computer analyses and office evaluation of the collected data and analog results. The results indicate (1) the proposed aquifer protection is feasible, (2) the recharge requirements will vary from 1.4 mgd in 1976 to 6.0 mgd in 2010, (3) seepage into the tunnels will be small, in amounts that can be easily controlled. AMMONIA NITROGEN LOSSES FROM STREAMS,
San Diego State Coll., Calif. Dept. of Civil Engineering.
Frank E. Stratton.
J of Sanitary Engineering Div, Proceedings of American Society of Civil Engineers, Vol 94, No SA6, p 1085-1092, Dec 1968. Proc Paper No 6282. 2 fig, 4 tab, 7 ref.

Descriptors: *Ammonia, *Nitrogen cycle, *Streams, Eutrophication, Water treatment, Turbulent flow, Water pollution control, Recirculated water, Water quality, Reclamation.
Identifiers: *Ammonia-nitrogen.

The loss of ammonia gas to the atmosphere due to surface turbulence may account for a significant quantity of ammonia-nitrogen losses from streams and rivers. A recirculating flume with a simulated river bed was used to determine the ammonia loss rate constant for a synthetic river water containing dissolved ammonium. Rate constants (per hour), k, at pH8, vary with temperature according to the relationship, k= 0.048 exp (0.13 (T-20)), where T is temperature (degrees Celsius). At 20 deg C, k varies with pH according to the relationship, k= 0.080 exp (1.57 (pH - 8.5)). According to these data, concentration of ammonia-nitrogen would be reduced 50% in 10.8 hours and 7.4 miles at T=20, pH=8.5; in 0.6 hours and 0.4 miles at T= 30, pH= 9.5. (Jacobs-Wisconsin)

Identifiers: Triazine, Dichlobenil.

Water weeds are posing increasing problems in many countries which depend on water control for development of agricultural, power, and transport resources. The United States, besides having its share of difficulties from water weeds, is also concerned with aquatic weed impairment of increasingly popular recreational aspects of water. Heavy water-weed infestation is expected when fertile land is submerged to form lakes, or when lakes and channels become silted. This problem is accentuated in developed countries by extra plant nutrients reaching water supplies from fertilizer and sewage effluent. Author presents a comprehensive review of the world's literature on aquatic weed control since 1960, to provide a guide to research with primary attention to those plants causing problems in warm environments. The literature citations are grouped as follows: Reviews, Identification, General recommendations, Important water weeds, Chemicals used in aquatic weed control, Control techniques, Biological control, Utilization of water weeds, Toxicology of herbicides to fish, Herbicides residues, and Water and its effect. Author indicates the need for more research in biological control and utilization of water weeds which might be useful in regions without the financial resources to deal with the problem. PROBLEMS OF THE PROTECTION OF WATER IN CONNECTION WITH THE BUILDING OF WATER-POWER PLANTS (IN GERMAN),
P. Nanny.
Wasser- und Energiewirtschaft, No 8-10, p 270-274, 1959.

Descriptors: *Hydroelectric plants, *Water utilization, Water quality, Water pollution effects, Fish management, Groundwater, Vegetation effects, Climatic data, Weather modification, Electric power, Peak power, Low flow augmentation.

The building of hydraulic power stations could have negative influence on (1) water quality and self-purification of downstream section, (2) changes in fish community, (3) groundwater relations, and (4) climatic conditions and vegetation. These aspects can occur if the dam is built for increasing the water level or if the water is removed from a river basin. In the second case, the negative influence is much more important and must be treated properly taking into account the downstream load by waste waters. In this case a survey study on low flow values and waste waters purification is necessary. (Novotny-Vanderbilt)

INCREASE OF PROFIT BY WASTE-HEAT DISCHARGE LOSSES (IN DUTCH).
Algemene Kunstzijde Unie N.V. (Netherlands).
C. G. Booij.
De Ingenieur, No 51, p A749-A758, Dec 20, 1968. 18 fig, 2 ref.

Descriptors: *Economic efficiency, *Thermal pollution, *Coolants, *Power plants, Temperature control, Heat transfer, Cooling towers.
Identifiers: Process industry, Waste-heat production, The Netherlands.

The paper deals with three main aspects of the subject, reviewing waste-heat generation, and use of natural cooling waters, the influence of coolant and process temperatures respectively, on prime cost of product, and measures for reducing waste-heat production. In conjunction with these points, the various aspects of internal as well as external optimization are considered, illustrated by examples and diagrams. The waste-heat production of the Netherlands is estimated for 1966 at 45,000 M.W. A short description of the waste-heat sources is given. The increase during the last ten years of the waste-heat production in the process industry was about 23% per year and for power plants 20% per year. (Rietveld-Vanderbilt)

COMBINED CONDENSER COOLING SYSTEM UPS PLANT AVAILABILITY,
Tennessee Valley Authority, Knoxville.
Gordon L. Ford.
Power Engineering, Vol 71, No 1, p 40-42, Jan 1967. 3 fig.

Descriptors: Thermal pollution, Water temperature, *Cooling towers.
Identifiers: *Stream temperature, *Cooling towers, Counterflow and crossflow type towers, Paradise Steam Plant (T.V.A.).

The Paradise Steam Plant being built by T.V.A. has a cooling system which will increase the availability of the earlier two units and will end heat rejection to the river during the summer, thus meeting adequately the thermal stream pollution criterion. The operation of the earlier two units during low flow period was limited according to stream temperature. The yearly average temperatures are 57.3 F dry bulb and 52.2 F wet bulb. On this basis, the optimum condenser-tower combination was determined to be that which would provide 72 F average temperature water at a condenser flow of 715 cfs, and a cooling range of 27.5 F. Hyperbolic natural draft cooling towers were chosen because they will discharge moisture-laden air over four hundred feet above the ground, which eliminates ground fog or recirculation of air through the towers and because of the additional advantage of low maintenance and operating cost. Descriptors: *Indiana, *Administrative agencies, *Rivers, *Streams, Maintenance costs, Maintenance, Bridges, Tunnels, Banks, Flow, Flow control, Obstruction to flow, Water pollution, Pollution abatement, Water pollution control, Bank protection, Banks.

The Board of Park Commissioners shall have the power to keep rivers, streams, and waterways that run through or bound park property open and free of pollutants. The Commissioners shall maintain the banks, build levees, control flow, and promulgate rules and regulations concerning said waterways. They shall construct any necessary dams, bridges, viaducts, or tunnels. They may require owners of real estate bounding on said waters to remove any pollutants from their banks or waters. The failure of property owners to comply empowers the Commissioners to remove such pollutants and to certify the cost of removal to the county treasurer who will assess the cost to the property involved. Identifiers: *River valley commissions, River valleys, Interstate waters, Minimum standards.

The Ohio River Valley Water Sanitation Compact is enacted and entered into by the state. Kentucky is within the Ohio River drainage basin. Each of the party states pledges its cooperation in the control and abatement of pollution of waters common to two or more states. A sanitation district and a sanitation commission are created. Selection procedures for and the qualifications of commissioners are provided for as is the administration of the commission. The guiding principle of the compact is that pollution by sewage or industrial wastes originating with a party state shall not injuriously affect the various uses of the interstate waters. Minimum standards are set for the treatment of sewage and waste. The commission is empowered to promulgate rules and regulations for administering and enforcing the foregoing provisions. The commission will survey, study, and report on ways to reduce pollution and, in so doing, will confer with all interested agencies. The commission will draft and recommend to the governors of the signatory states uniform legislation dealing with pollution problems within the district. The commission will consult with and advise any party having particular problems connected with water pollution, particularly with regard to the construction of treatment plants. (Keith-Florida)

NORTH SUBURBAN SANITARY SEWER DISTRICT V WATER POLLUTION CONTROL COMM'N (WATER POLLUTION CONTROL STANDARDS).
162 NW2d 249-259 (Minn 1968).

Descriptors: *Minnesota, *Water pollution control, *Sewage, *Standards, Administration, Pollution, Stream pollution, Water quality control, Water pollution treatment, Water pollution, Effluents, Cities, Impaired water quality, Pollution abatement, Sewage effluents, Potable water, Administrative decisions, Judicial decisions, Administrative agencies, Legal aspects.

The Water Pollution Control Commission was created to investigate pollution of the waters of this state, to establish reasonable pollution standards, to make reasonable orders requiring the discontinuance of the discharge of sewage or other wastes into any waters of the state, and to issue, deny, or revoke permits for the discharge of sewage. Respondent Sewer District was created to deal with sewage problems unique to its district. Pursuant to its powers and duties, the district planned for an outfall of effluent 1.1 miles downstream from the main water intake of the city of Minneapolis. The Commission has held that the possibility of contamination due to human failures and unusual natural conditions warrants a standard prohibiting such outfall. The district argues that the possibility of contamination is so remote that the standard is unreasonable and invalid. The trial court was justified in finding the standards unreasonable and exceeding the Commission's statutory powers. The prohibition was absolute and without reference to the purity of the effluent, and it was unreasonable to accept the probability that effluent would ever reach the water intake. These standards were only invalid as applied to these facts. (McFerrin Smith-Florida)

SANITATION DISTRICTS.
Ky Rev Stat Ann secs 220.010-220.540 (1963), as amended, (Supp 1968).

Descriptors: *Kentucky, *Administrative agencies, *Environmental sanitation, *Sewage districts, Sanitary engineering, Water pollution, Waste disposal, Eminent domain, Condemnation, Construction costs, Financing, Taxes, Project planning, Stream improvement, Sewers, Public health, Water pollution control, Legislation, Legal aspects.

The Commissioner of Sanitation Districts is vested with jurisdictional power and authority to establish sanitation districts within any county. Upon petition by freeholders or municipalities within a proposed sanitation district, the Commissioner may establish a sanitation district in order: (1) to prevent and correct pollution of streams; (2) to regulate the flow of streams for sanitary purposes; (3) to clean and improve stream channels; and (4) to provide for the collection and disposal of sewage and other liquid wastes. A board of directors governs the operation of each sanitation district. Each board has authority to (1) prepare plans for the construction or improvement of sanitation projects; (2) hold, encumber, and control by purchase or condemnation any real or personal property within the district; (3) contract and be contracted with; (4) levy certain annual taxes; (5) issue negotiable sanitation district bonds; and (6) do those things necessary to carry out the purposes of the district. (McDonough-Florida)

SANITATION DISTRICTS.
Ky Rev Stat Ann secs 220.010-220.130 (1963), as amended, (Supp 1968).

Descriptors: *Kentucky, *Water pollution control, *Administrative agencies, *Sewage districts, Stream improvement, Eminent domain, Condemnation, Environmental engineering, Environmental sanitation, Streams, Sewers, Laterals, Siphons, Waste disposal, Channel improvement, Legislation, Legal aspects, Liquid wastes, Cities, Local governments.

The state Director of the Division of Sanitary Engineering of the Department of Health also acts as the Commissioner of Sanitation Districts. He has the power to establish sanitation districts to prevent stream pollution, to clean streams, and to provide for the collection and disposal of sewage and liquid wastes. Sixty percent of freeholders within a proposed district or any municipality not of the first class may petition the Commissioner to establish a district. Municipalities within the proposed district may decide whether city property will be included within the district. Upon notice of the petition and a favorable investigation, the Commissioner may declare a sanitation district. Objection to the proposed district must be timely. The sanitation district is a political subdivision of the state with perpetual existence and powers: (1) to sue and be sued; (2) to contract and be contracted with; (3) to incur liabilities; (4) to exercise the right of eminent domain; (5) to assess and levy taxes; (6) to issue bonds; and (7) to do other acts to carry out the purposes of the district. The certificate establishing the district is binding on all district realty. (McDonough-Florida)

SANITATION DISTRICTS.
Ky Rev Stat secs 220.140-220.350 (1963), as amended, (Supp 1968).

Descriptors: *Kentucky, *Administrative agencies, *Sewage districts, *Project planning, Environmental sanitation, Contracts, Eminent domain, Condemnation, Sanitary engineering, Water pollution, Sewage, Stream improvement, Construction, Laterals, Siphons, Bids, Operation and maintenance, Water pollution control, Legislation, Legal aspects, Regulation, Control.

A sanitation district is governed by a board of directors which has all the powers of the district and controls all the affairs and property of the district. The board has the power to: (1) adopt necessary rules and regulations for the proper management and construction of sanitation projects; (2) hire an engineer and attorney; and (3) prepare and execute plans approved by the State Board of Health for the construction and improvement of sanitation projects. After a district is established, no person or corporation may install or construct any sewage facility without the approval of the board and the state Board of Health. The board is limited to operations aimed at the construction and maintenance of projects including: (1) the improvement of any stream, watercourse, or body of water receiving sewage; (2) the construction and maintenance of laterals, trunk sewers, intercepting sewers, and other disposal works; (3) the acquisition by purchase or condemnation of any real or personal property within the district; and (4) the contracting for sanitation service for wastes produced outside the district. Installation or operation contrary to this chapter constitutes an abatable nuisance. (McDonough-Florida)
W70-00401

SANITATION DISTRICTS.
Ky Rev Stat Ann secs 220.360-220.540 (1963), as amended, (Supp 1968).

Descriptors: *Kentucky, *Administrative agencies, *Financing, *Sewage districts, Costs, Construction costs, Taxes, Water pollution, Sewers, Sewage disposal, Project planning, Eminent domain, Environmental sanitation, Condemnation, Sanitary engineering, Legislation, Legal aspects, Cities, Maintenance costs, Rates.
Identifiers: Annexation.

The board of directors of a sanitation district may levy up to three annual taxes to cover initial costs. The board may issue negotiable warrants and sanitation district bonds to defray costs of construction and property acquisition. The bonds are not subject to taxation and are payable solely from sanitation district income but are not to be considered debts of the district within the meaning of the state constitution. Holders of district bonds have a statutory lien on all sanitation district property. The board determines reasonable rates and compensation or rentals to be charged for the use of sanitation facilities, but all rates must be uniform within a given class of users. A district may petition the commissioner of sanitation districts to annex additional territory to the existing district. Specified sized cities having their own sanitation systems may petition to annex part of or all of an existing sanitation district. (McDonough-Florida)

Descriptors: *Planning, *Project planning, *Critical path method, *Scheduling, Control, Timing, Water resources development.
Identifiers: Project Evaluation and Review Technique.

The techniques of network planning and scheduling are now firmly established as management tools in business and industry. By means of network diagrams showing time, phase, and cost relations, the techniques facilitate efficient scheduling and managing of projects of any size or complexity. The two most common methods of network planning and scheduling are PERT (Program Evaluation and Review Technique), which was developed by the U.S. Navy for use in the evaluation a review of development projects, and CPM (Critical Path Method), which was developed by International Business Machines and E. I. du Pont de Nemours and Co. The original versions of CPM and PERT differ in that CPM requires two time estimates, both related to cost, and PERT requires three time estimates related to probability. For planning and evaluation of water resources studies and construction projects, a simplification of the two systems requiring only one estimate (normal time) is ideally suited. (Knapp-USGS)

Descriptors: *Indiana, *Surveys, *Water rights, *Water resources, Water resources development, Water management (Applied), Water conservation, Ground water, Surface waters, Water utilization, Flood control, Pollution abatement, State jurisdiction, Legislation, Legal aspects, Planning, Projects, Federal government, Resource development, Interagency cooperation, Administrative agencies, Federal government.

A study committee is hereby appointed and directed to make a comprehensive survey and study of water rights and water management, including surface and ground waters in Indiana. The committee shall contain, among others, members representing the state flood control and water resources commission, the department of conservation, the board of health, and the pollution control board. The committee shall submit biennial reports to the legislature. State agencies are to cooperate with the committee in its efforts if requested. The state flood control and water resources commission, the board of health, and the water resources division of the department of conservation are authorized by the Water Resources Research Act of 1965 to conduct applied research in their respective areas for solution of problems involving the beneficial development, use, and management of the state's water resources. The need for additional knowlege is urgent in such areas as drainage of streams, meandering characteristics of alluvial streams, climatic effects of evaporation losses from impoundments, and mapping of the location and availability of ground water. The agencies are to report to the water resources study committee and are authorized to cooperate with other state agencies and the federal government. (Kelly-Florida)

Descriptors: *Mathematical models, *Optimization, *Multiple-purpose reservoirs, *Reservoir operation, Recreation, Municipal water, Water supply, Hydroelectric power, Irrigation water, Flood control, Navigation, Sport fishing, Systems analysis, Dynamic programming.
Identifiers: *Pattern search.

A fairly realistic nonlinear model of a water reservoir system with multiple uses was developed based on available data, and the optimum of the system based on the developed model was determined by the combined use of dynamic programming and pattern search techniques. Both the simplex search and the Hooke and Jeeves pattern search were used. Modeling and optimization can treat complex inequality constraints. The benefits or losses resulting from urban water supply, hydroelectric power generation, irrigation, and recreation are taken into account in the profit function. Other uses such as flood control, navigation, and fish and wildlife enhancement are considered indirectly by the use of inequality constraints. It is concluded that the optimization-research approach can treat a water resource allocation problem involving complex inequality constraints. (Knapp-USGS)

Water Resources Bull, Vol 5, No 3, p 50-56, Sept 1969. 7 p, 2 tab, 3 ref.

Descriptors: *Water resources development, *Project planning, *Evaluation, *Risks, *Economics, Flood control, Damages, Costs, Project life, Cost allocation, Cost-benefit analysis, Feasibility, Optimum development plans, Probability.
Identifiers: Project feasibility.

Factors that influence the acceptability of the expected-value criterion are examined in evaluating a method of handling risk or uncertainty in decision-making where damages from unusual physical occurrences such as hurricanes or floods must be considered. These factors are the project duration and the problem of obtaining accurate estimates of the probability of occurrence for different sizes of natural disasters. The problem of estimating accurate probabilities of occurrence for different sizes of natural disasters is not as great as it might appear and in most situations will not defeat the usefulness of the method. The time span during which the project is expected to exist has greater implications for the usefulness of the expected value criterion. For projects with a continual or long-term existence, the expected value approach appears highly applicable. However, it becomes less applicable for projects that are short-term in nature. The basis for distinguishing short- and long-term projects is presented. (Knapp-USGS)

CONCEPTUAL PROBLEMS IN WATER-QUALITY ECONOMICS,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
William Whipple, Jr.
Jour San Eng Div, ASCE, Vol 95, Oct 1969. p 3, Discussion of Proc Paper 6005 by W C Ray and W R Walker, June 1968.

Descriptors: *Benefits, *Water quality, *Optimum development plans, Public health, Recreation, Economic decision making, Value.
Identifiers: *Water quality benefits, Recreation benefits, Home environment, Working environment.

Without economic evaluation of water quality, there is no way to determine whether or not a given water quality standard represents an optimum situation. Ray and Walker consider benefits under headings of recreation, public health and aesthetic values. Methods of evaluating recreation benefits are now fairly well developed. Public health values are apt to remain intangibles, except for low standards that are not considered among debatable alternatives in the U.S. Aesthetic benefits is too narrow a concept for remaining benefits, which include improvements in both home environment and working environment. Although, as Ray and Walker point out, FWPCA officials in the past have moved slowly in this field, the Water Resources Council has expressed a government policy in favor of evaluating water quality benefits. The Ohio Valley Interstate Commission is hereby created to promote comprehensive planning for the optimal use of the Ohio River Valley's human and natural resources. The term 'Ohio Valley' means the Ohio River, its tributaries and all land drained by said river and tributaries, to the extent that they lie within the party states. Each party state may have seven commissioners. The commission shall have the power to: (a) promote the balanced development of the valley by certain procedures of recommendation and publication; (b) recommend integrated plans and programs for the conservation, development, and proper utilization of the water, land, and related natural resources of the Ohio Valley; (c) secure the necessary research and developmental activities; (d) make recommendations for appropriate action to the party states and the federal government. RECENT DEVELOPMENTS IN FISHING METHODS AND EFFECTS OF MANAGEMENT ON EFFICIENCY,
Dayton L. Alverson.
In Biological and Economic Aspects of Fisheries Management, College of Fisheries and the Department of Economics of the University of Washington at Seattle, p 142-147, Feb 17-19, 1959. 7 p.

Descriptors: *Management, *Fisheries, Salmon, Competition, Regulation, Trawling, Technology, Fish management, Fish attractants, Fish conservation, Productivity.
Identifiers: *Economic growth, Shrimp, Cod trawlers.

Fishing is one aspect of water resources which has experienced a large growth in technology since the end of World War II. The author gives the causes of this growth and some of the improvements resulting from it. The effect of these improvements is studied with special emphasis on the deficiencies of the United States in this area. Regulations in the area have not been what might have been hoped for and have been detrimental to the fishing industry in many situations. Management of ocean fisheries has been wrong in attempting to control production by controlling efficiency. The international position of world fisheries is in a very competitive status and inefficiency cannot be tolerated. (Murphy-Rutgers)

ALTERNATIVE USES OF THE NATURAL ENVIRONMENT,
Economic Development Administration, Washington, D.C.; and Vermont Univ., Burlington.
Harvey A. Garn, and Gene Laber.
In Planning 1968, Selected Papers from the ASPO National Planning Conference, San Francisco, p 262-270, May 4-9, 1968. 9 p, 10 ref.

Descriptors: *Conservation, *Environment, Economic impact, Industrial production, Income, Water pollution, Fishing, Costs, Deterioration, Social values, Income analysis.
Identifiers: *Social accounting system, Market system, Income distribution, Social benefits, Social costs.

The article argues from the premise that in order to achieve over-all increases in per capita income, some natural resources, including, of course, water resources, must be expended. It stresses the need in general for a full social accounting system for intelligent decision-making with explicit recognition of possible distribution objectives. It also deals specifically with the special circumstances which surround the question of resource use in low-income regions. The social accounting system is needed especially to deal with the classic externality problems encountered as well as some complex income distribution implications. In addition, many of the outputs lack market values. Some interesting suggestions are also made for the use of natural resources in low-income regions as an integral part of the larger topic of resource allocation stressed here. Water resources planning is concerned with most of the same problems. (Murphy-Rutgers)

FLOOD CONTROL BENEFITS AND THE TENNESSEE VALLEY AUTHORITY,
Georgia State Coll., Atlanta, Ga. School of Business Administration.
James E. Hibdon.
Southern Economic Journal Vol XXV, No 1, p 48-63, July 1958. 16 p.

Descriptors: *Flood control, Economic evaluation, Taxes, Government, Economic analysis, Benefits, Economic justification, Costs, Dam, Statistics, Flood damage, Flood plain, Welfare economics, Pricing, Indirect benefits.
Identifiers: *TVA, *Flood losses, *Land value.

The author raises questions concerning the accuracy of the flood control benefits provided by the TVA. Flaws are demonstrated to exist in the assumptions on which the estimates were based and indicate that the estimates are exaggerated. The flood control program may be justified economically but proof of the justification would require a better determination of the value created as well as a test of its adequacy relative to the costs. The author also questions the subsidy which accrues to bondholders who gain the benefits of increased productivity but do not pay the costs of flood control. The application of a levy against land as a feasible means of exacting payment from beneficiaries of flood control programs is proposed. (Murphy-Rutgers)

6D. Water Demand

WATER-USE AND WATER-RIGHTS POLICY IS CHANGING,
J. A. Johnson.
J Soil Water Cons, Vol 14, No 1, p 3-6, Jan 1959. 4 p.

Descriptors: *Water policy, *Water rights, *Water users, *Southeast U. S., Legislation, Reasonable use, Public benefits, State governments, Judicial decisions, Legal aspects, Water law, Political aspects, Riparian rights, Planning, Storage, Beneficial use, Water demand, Water resources, Water allocation (Policy), Water demand.

Eastern states are taking a new look at water problems and water-rights policies. State legislatures and water-user organizations are attempting to educate the public to these problems. Studies have been instituted in an attempt to evolve water policies which will meet modern needs. Water policy may be defined by the legislature in one broad act and usually goes as far as the people are ready to act. Water policy, to be fully effective, must be acceptable to the people or users to which it applies. In years past water-rights policies and laws were for the most part court-made. Water users wanting more adequate protection for their investments and more specific rights of use pushed for a change in water policy. Formal action began in the early 1950's in the Southeast. The direction of change has been toward beneficial use, conservation of supplies, encouragement of seasonal storage, and restrictions upon waste and unreasonable methods of use. Southeastern states have adopted in their new laws one or more aspects of the western system. An example is the general declaration of reasonable beneficial use found in a number of eastern statutes. The water-use needs and water problems of this entire section of the country have changed materially in recent years. Such adjustments as prove necessary can be made with benefit of a vast background of experience existing in all states. (Heckerling-Florida)

WATER RIGHTS AND OUR EXPANDING ECONOMY,
C. E. Busby.
J Soil and Water Cons, Vol 9, No 1, p 65-69, Jan 1954. 5 p.

Descriptors: *Water rights, *Water utilization, *Water law, *Water resources development, Reasonable use, Prior appropriation, Riparian rights, Administration, Water demand, Water management (Applied), Water conservation, Water allocation (Policy), Water consumption, Judicial decisions, Damages, Legal aspects, Groundwater, Water supply, Water conservation.

Recently some states have experienced a considerable expansion in water use by agriculture, industry, towns, and cities. As a result, competition and conflicts have arisen, especially during periods of great water demand and limited water supply. These conflicts of interest over water are not new. The system of water rights and administration in the eastern states is very different from that in western states where life is directly or indirectly dependent on water. These systems differ in three basic areas: (1) the emphasis placed upon beneficial use and conservation of water, (2) the emphasis placed upon security for and encouragement of investments in water development and use, and (3) the emphasis placed on statewide and local administrative responsibility for guiding water development and use. All three policies are emphasized in the West, but not in the East. Some of the most vital questions of policy which need examination are: (1) the use and damage aspects of water, (2) water law and administration in general, (3) rights to water in the air, and (4) rights to water on the ground. The present water law found in the East was developed by the courts over one hundred years ago and is in need of modification along lines consistent with present water and related land capabilities. (Heckerling-Florida)

A STATE STATUTE TO POVIDE CONTROLS FOR EQUITABLE DISTRIBUTION OF WATER.
Harv J Legis, Vol 4, No 3, p 399-419, Jun 1967. 21 p, 70 ref.

Descriptors: *Legislation, *Administrative agencies, *Water resources development, *Future planning, Administration, Decision making, Riparian rights, Prior appropriation, Optimum development plans, Resource allocation, State governments, Water allocation policy, Water users, Permits, Water policy, Water resources, Water supply.
Identifiers: *Equitable water distribution.

This article proposes a statute to deal with the imminent water shortage facing the eastern half of the United States. Citing the inefficiency of both the riparian and prior appropriation theories, the article proposes an administrative system. A discussion of the background and perspective of the proposed statute, including constitutional problems, precedes the body of the statute. The statute contains eight articles. Article one contains definitions of terms. Article two sets forth a declaration of policy and standards which calls for the development, utilization, and control of all water resources to effectuate the maximum public benefit. Articles three and four establish a Water Resources Board with jurisdiction over all water resources in the state. A broad variety of powers and duties, consistent with the purposes of this legislation, are detailed. Article five requires permits for the use of water. A detailed system to insure that all water is distributed equitably and beneficially is provided, and procedures for applications, hearings, fees, and judicial review are outlined. (Schram-Florida)

WATER LEGISLATION,
Edward Hamming.
Economic Geography, Vol 34, No 1, p 42-46, Jan 1958. 5 p, 11 ref.

Descriptors: *Legislation, *Water law, *Water utilization, *Riparian rights, Reasonable use, Prior appropriation, Surface waters, Percolating water, Land tenure, United States, Water rights, Groundwater, Legal aspects, Water demand State governments, Water resources, Overlying proprietor, Public rights, Flow, Water supply.

With the demand for water in the United States constantly increasing there is a need for state regulations defining and delimiting the rights of individuals and corporations in utilizing this resource. There are two basic doctrines of water use: the riparian or common law rule and the prior appropriation doctrine. The fundamental differences between the two doctrines have caused a long history of litigation and have brought about drastic modifications in water rights legislation. The riparian doctrine applies to both surface and underground waters. In the former case it is aimed at maintaining an unrestricted flow of water in surface streams; in the latter case the owner of the overlying land has the absolute ownership of percolating water existing in his land. Recent trends put groundwater on the reasonable use basis or apply the same principles of use and administration to groundwater as are applicable to surface waters. The trend is toward appropriation, which calls for effective public control. Any change in water legislation must be based on scientific research, for efficient utilization of the water supply may be had under either the riparian or appropriation doctrines, provided the governing principles are well defined and applied. Descriptors: *Water resources development, *Administration, Water allocation, Local government.

The problem of the scarcity of water is, on a national scale, not an unfavorable overall balance position, but a liquidity problem. Usually the quantity of water should be sufficient if carefully controlled and distributed on a national and regional level. Firstly, this management will have to be one of the bases of the overall national planning and the annexed regional planning especially in relation to (1) industrial activity and (2) the location of power plants. Secondly, management of surface- and groundwater should be closely co-ordinated and in most cases even integrated. Thirdly, this co-ordinated management should balance all interests concerned and should have means at its disposal in order to compensate interested parts. Finally, a strongly co-ordinated management will have to curtail the historically grown autonomy of boards on lower level, either by reorganizing their tasks in the framework of the new national structure, or by winding up these boards and transferring their tasks. Descriptors: *Domestic water, *Water pollution, *Water supply, Water pollution control, *Municipal water, *Recreation, Swimming, Boating, Fishing, Potable water, Aesthetics, Public health, Bacteria, Coliforms, Streptococcus, Water quality, Water treatment.
Identifiers: Public Health Service, Bacteria control, Virology.

Public pressure for water-based outdoor recreation is growing in the United States. Because of heightened interest, increasing attention is being given to the possibility of using public water supply sources for recreation. Five studies were made in various locations to determine the impact of water-based recreation on water quality. These studies indicated that little or no deterioration in bacterial water quality occurs at the water supply intake when recreation is permitted in or around public

water supplies. In cases where some rise in indicator organism density occurred, it was localized within the high recreational use areas and the bacterial content at the water supply intake was within the limits that permit removal by existing water treatment technology. Problems of aesthetics and loss of control of utility property, and concern over a slight deteriorating trend in water quality will probably make the decision a local matter, causing utilities to proceed cautiously in opening their reservoirs for recreation. MCCUE V CARLTON (TITLE TO ACCRETIONS).

399 Ill 11, 76 NE2d 435-438 (1947).

Descriptors: *Illinois, *Accretion (Legal aspects), *Boundaries (Property), *Riparian land, Judicial decisions, Bank erosion, Erosion, Avulsion, Boundary disputes, Sedimentation, Stream erosion, High water mark, Riparian rights, Rivers, River beds, Water law, Streams, Legal aspects, Land forming.
Identifiers: Adverse possession.

Plaintiff owned land on a river, the deed to which granted title to the shoreline of the river. Defendant owned land adjacent to plaintiff. Defendant's deed excluded title to any land lying below the highest high water mark. Both parties claimed title to land formed by accretion and by recession of the river on one side. They both claimed by adverse possession. Plaintiff brought an action to confirm title and to enjoin trespassing by the defendant. The court held title to be in plaintiff. Accretions to riparian land held under a claim of adverse possession or by color of title go with the land to which they are attached. To acquire land formed by accretion there must be a natural and actual continuity to the land of the riparian owner. Defendant's land, because of the exception in his deed, was not riparian, and he could have no title in accretions. The court found that the evidence confirmed that title to the accretion was in plaintiff by adverse possession. (Helwig-Florida)

EMINENT DOMAIN AND WATER LAW,
Richard S. Harnsberger.
Neb L Rev, Vol 48, No 2, p 325-455, Jan 1969. 131 p.

Descriptors: *Eminent domain, *Water law, *Condemnation, *Compensation, Legislation, Legal aspects, Public benefits, Highways, Water policy, Water resources development, Damages, United States, Riparian rights, Navigable waters, Cities, Water supply, Regulation, Judicial decisions, Water allocation (Policy), Watercourses (Legal), Condemnation value, Dams, Streamflow, Multiple-purpose projects.

The doctrine of eminent domain has played a unique role in the attainment of social and economic goals in the United States because it permits property to be taken rather easily from private persons for public uses and purposes. Today condemnation procedures are particularly significant tools in urban renewal projects, municipal and state expressways, national interstate and defense highways, multipurpose water development undertakings, sewerage, and flood control works. One of the most troublesome legal questions growing out of the eminent domain doctrine is whether the government should be required to pay compensation for particular property taken or damaged by this action. This article examines that question generally and in the context of selected situations in water development and allocation. (See W70-00071 thru W70-00082). (Heckerling-Florida)
W70-00070

THE NATURE AND SCOPE OF THE EMINENT DOMAIN POWER,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 327-342, Jan 1969. 16 p.

Descriptors: *Eminent domain, *Public rights, *Damages, *Compensation, Federal government, Adjudication procedure, Judicial decisions, State governments, Construction, Condemnation, Legal aspects, Land tenure.
Identifiers: Reserved rights, Sovereignty.

The power of both state and federal governments to acquire private property for a public or a semipublic use is well recognized and is theoretically explained as either a 'reserved right' or a power inherent in 'sovereignty'. Under the 'reserved right' theory, the state is the presumed original owner of all property and subsequent private ownership is deemed subject to the prerogative of the sovereign to resume possession whenever the best interests of society require. By definition the sovereign power of eminent domain applies only to a taking for a public use and does not exist if the proposed use is private. Any private use is therefore without either sovereign or constitutional authority. The concept of public use is given a broad definition in eminent domain proceedings. As distinguished from public purpose, the extent of public necessity for the construction and location of an improvement is a legislative question and not subject to judicial review. In addition to prohibiting the taking of property for private purposes, the due process clause of the Constitution requires that eminent domain, as an exclusively legislative prerogative, be authorized by action of the legislature. The due process clause imposes safeguards in favor of the property owner including just compensation and trial by jury. (See also W70-00070). (Heckerling-Florida)
W70-00071

EMINENT DOMAIN AND POLICE POWER,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 342-354, Jan 1969. 13 p.

Descriptors: *Eminent domain, *Compensation, *Public benefits, *Land tenure, Legal aspects, Judicial decisions, Condemnation value, Damages, Standards, Regulation.
Identifiers: *Police powers.

The general concepts governing eminent domain and the police powers cut across many types of decisions and become significant when determining whether compensation is payable. When private property is taken for public use under the power of eminent domain, the owner is entitled to receive just compensation. Conversely, if a restriction upon the utilization of property is merely a proper exercise of the government's police power, no compensation is due. Compensation is payable whenever an owner is physically dispossessed, but only consequential damages occur where there is no dispossession. This test fails to demonstrate the method of reasoning and merely places the problem in terms which are no more helpful and only one step removed from the primary terms, police power, and eminent domain. It has come to be recognized that there is only a difference in degree between non-compensable damage to a property owner under the police power and a deprivation of property rights under the power of eminent domain. Some authorities take the position that no compensation is payable where a regulation forces an owner to bear the external costs or burdens of his private activities, but that compensation should be paid when benefits accrue to the community. (See also W70-00070). (Heckerling-Florida)

PRIVATE UNDERTAKINGS AS PUBLIC USES,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 354-366, Jan 1969. 13 p.

Descriptors: *Eminent domain, *Public benefits, *Water utilization, *Judicial decisions, Legislation, Riparian rights, Local governments, Jurisdiction, Condemnation.
Identifiers: Constitutions.

Theoretically, property taken by eminent domain should be put strictly to public use. Even though a legislature approves a project as a public one, the ultimate decision as to whether the use is in fact public, rests with the courts. There is no exact definition of the term 'public use', and most courts make no effort to formulate one. Water is so important in arid states that many constitutions have provisions for its utilization. Constitutional provisions take several different forms. In the western states, the existence of water preference provisions may also affect the right of eminent domain. Generally, preference provisions manifest a policy to favor certain uses of water and are enacted as either constitutional or statutory provisions. Several western states allow a private person to exercise eminent domain to acquire property for his own exclusive use. Since public needs obviously must be determined in relation to environment, local conditions are an important factor in any jurisdiction which considers public benefit or advantage in determining whether private utilization of condemned property is for a 'public use'. (See also W70-00070). (Heckerling-Florida)

MUNICIPAL WATER SUPPLIES,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 366-377, Jan 1969. 12 p.

Descriptors: *Eminent domain, *Cities, *Municipal water, *Riparian rights, Judicial decisions, Compensation, Condemnation value, Riparian land, Public benefits, Damages, Natural flow doctrine, Reasonable use, Jurisdiction, Land tenure, Value, Water supply, Diversion.

Towns and cities are everywhere empowered by either statute or state constitution to condemn private water rights to secure water for public or domestic uses, and this effectively gives them a preference to use water on condition that the owners are compensated. The amount a municipality must pay when condemning water rights depends upon local water law. The 'natural flow' riparian doctrine is extremely wasteful in that it gives every riparian owner the right to have stream waters flow uselessly into the sea. It has been replaced in many jurisdictions by a 'reasonable use' riparian doctrine. The reasonable use doctrine allows riparian owners to divert such water as they may reasonably use to satisfy the natural demands for water upon their riparian property. The usual measure of damages under the riparian doctrine for the taking of water is the depreciation in value of the riparian land. When a municipality condemns property to obtain a new source of water supply, a problem arises as to how the landowner should be compensated. Should he be compensated according to the market value of his land or according to the value to the municipality. The courts are divided on this question. (See also W70-00070). (Heckerling-Florida)
W70-00074

CONDEMNATION FOR PUBLIC PROGRAMS,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 377-388, Jan 1969. 12 p.

Descriptors: *Eminent domain, *Condemnation, *Public benefits, *Federal government, Judicial decisions, Watercourses (Legal), Riparian rights, State governments, Streamflow, Beds, Beds under water, Navigable waters, Navigation, Docks, Bridges, Compensation, Flood control.
Identifiers: Navigational servitude.

Controlling floods, canalizing channels, developing watersheds and river basins, and stabilizing watercourses for downstream purposes are programs primarily undertaken by the federal government. States have not entered into these areas to any significant degree. One of the most important delegated powers of the federal government relating to water is the commerce clause. A watercourse is subject to the power of Congress if navigable in its natural condition. Riparian owners have a number of special rights which are recognized by state laws as being inseparably connected to the land. Just compensation is due when they are taken for public uses. Activities by riparian proprietors and the United States frequently interfere with uses the other wants to make of the stream flow or the beds. Under a number of court decisions, a riparian owner's rights are qualified by the federal navigation servitude whenever his property is located in the bed of a stream below high water level. He is entitled to no compensation for distruction of: a submerged bed, access to water, wharves and other structures, bridges over the watercourse, or rights in the flow of the water. (See also W70-00070). (Heckerling-Florida)
W70-00075

THE 'RIVER' CASES,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 388-410, Jan 1969. 23 p.

Descriptors: *Eminent domain, *Judicial decisions, *Federal government, *Condemnation, Compensation, Alteration of flow, Diversion, Water level fluctuations, Water rights, Land tenure, Water law, Flood control.
Identifiers: *Inverse condemnation.

The liability of the government for artificially changing the level of the water and for backing up or changing the direction of flow has been considered in numerous cases in the period from 1871 to 1950. These cases arose chiefly from governmental flood control activities. Physical seizure of water rights by the United States may be accomplished by either a physical invasion of land or an upstream interference with the water flow. The ability of the United States to appropriate property by physical seizure, rather than by direct condemnation, has produced many major decisions in eminent domain law. Injunctive relief is rarely granted. The 'river' cases are important precedents for determining what kinds of property rights may be successfully asserted in seeking compensation for condemnation against the United States. Supreme Court decisions are persuasive authority in state courts. (See also W70-00070). (Heckerling-Florida)
W70-00076

PROBLEMS OF VALUATION AND THE MILLER RULE,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 410-415, Jan 1969. 6 p.

Descriptors: *Eminent domain, *Condemnation value, *United States, *Compensation, Judicial decisions, Land use, Condemnation, Reclamation, Projects, Value.

Many complex problems arise in attempting to define and measure just compensation, and opinions differ over the proper methods to be used in establishing the value of the property taken. The almost universally accepted formula is fair market value of the property at the time of the taking. Potential utilization of the property by the owner is a relevant factor, but special value to the condemnor may not be made a part of the award. Large public works such as reclamation projects often involve hundreds of thousands of acres of land. To protect the government from paying for the increased value resulting from its own activities, the so-called Miller rule specified that if property is 'probably within' the scope of the project from the time the government is committed to the undertaking, even though ultimately it might not be taken, any increase in value due to the project is excluded. (See also W70-00070). (Heckerling-Florida)
W70-00077

THE 'POSSIBILITY OF COMBINATION' RULE; EFFECT OF FEDERAL WATER POWER ACT ON PRIVATE RIGHTS,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 415-422, Jan 1969. 8 p, 19 ref.

Descriptors: *Eminent domain, *Federal Power Act, *Riparian rights, *Compensation, Judicial decisions, Federal government, State governments, Condemnation value, Land use, Navigable waters, Legal aspects.

The majority of the decisions reveal that private owners have been confronted with a number of legal hurdles in their efforts to obtain compensation from the government. Generally, the rule is that if the property under consideration must be consolidated with other properties to make it suitable for a special use, such special use cannot be considered in the valuation unless the possibility of affecting the necessary combination is so likely that market value is affected. Under the Federal Water Power Act rights under state law to use the water of a navigable stream are not abolished. When the United States delegates its power by granting a license under the Federal Water Power Act, the license must pay for damage to private riparian rights even though the riparians would have been unable to recover from the federal government for the same harm. (Heckerling-Florida)
W70-00078

NON-COMPENSABILITY OF LOCATIONAL VALUES ATTRIBUTABLE TO USE OF THE FLOW,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 422-434, Jan 1969. 13 p, 36 ref.

Descriptors: *Eminent domain, *Condemnation value, *Compensation, *Navigable waters, Judicial decisions, Federal government, Streamflow, Regulation, Riparian rights, Legislation, Navigation, Flood control, Watercourses (Legal), Legal aspects, Water law.

When the United States exercises its navigation easement, riparian lands on a navigable watercourse can gain no value from possible uses of the water which an owner might have made. An owner is not entitled to compensation for location values attributable to uses, actual or potential, which are dependent upon use of the water or access to it. Federal statutes provide that when land is taken for a river improvement, compensation is to be reduced by any special and direct benefits conferred by the project upon the owner's remaining land. No rights attach to the flow of a non-navigable tributary when Congress exercises its power to control floods in aid of navigation on a navigable main stream. Riparians on both navigable and non-navigable streams hold their property subservient to the power of Congress to regulate and improve navigable waters of the United States. The power is applied when Congress specifies the waters which it believes are necessary in aid of navigation. The Supreme Court has denied compensation for the value of riparian lands attributable to the flow of a navigable watercourse. (Heckerling-Florida)
W70-00079

SUMMARY OF SERVITUDE DECISIONS RELATING TO COMPENSABILITY,
Richard S. Harnsberger.
IN Eminent domain and water law. Neb L Rev, Vol 48, No 2, p 434-435, Jan 1969. 2 p, 11 ref.

Descriptors: *Eminent domain, *Judicial decisions, *Federal government, *Compensation, Condemnation value, Navigable waters, Non-navigable waters, Navigation, Water levels, Riparian land, Tributaries, Watercourses (Legal).
Identifiers: *Servitudes.

In reviewing the servitude cases several important factors stand out. First, the servitude is not co-extensive with the power of the United States over the country's watercourses under the commerce clause. The navigation power today extends to watercourses navigable in fact, those which are non-navigable but can be made navigable by artificial improvements at a reasonable cost, and non-navigable tributaries. Second, recovery against the Government is more likely if the level of the water in the watercourse is raised. Third, there have been few recoveries against the Government between 1871, when compensation was awarded for flooding riparian uplands and 1950, when recovery was permitted for the backing up of a non-navigable tributary onto riparian property. Fourth, the principal compensable situation arises when work done by the United States for improvement of navigation causes water to permanently overflow lands above ordinary high water mark. Fifth, the Government incurs no liability for activities in aid of navigation when these are carried on between the ordinary high water marks of navigable stream beds; but when the Government exercises its power over navigable streams and thereby causes interference or injuries to private property on non-navigable tributaries, compensation is payable. (Heckerling-Florida)
W70-00080

THE SERVITUDE DOCTRINE; THE DOCTRINE UNDER ENGLISH LAW,
Richard S. Harnsberger.
IN Eminent Domain and Water Law, Neb L Rev, Vol 48, No 2, p 436-442, Jan 1969. 7 p, 25 ref.

Descriptors: *Eminent domain, *Navigable waters, *Federal government, *Public rights, Judicial decisions, Compensation, Water law, Legal aspects, Riparian land, Non-navigable waters, Federal jurisdiction, Fishing, Tidal waters.
Identifiers: Servitude doctrine, Commerce, Common law.

Awarding compensation to riparians on non-navigable streams for damages when water in the main channel is lawfully raised to improve navigation relieves them from bearing part of the cost of the federal project. A review of decisions leads to the conclusion that the Supreme Court is not confident about how the servitude doctrine became the 'raison d'etre' of plenary federal power over the nation's watercourses. It has been stated the the source of the power arises from: (1) the commerce clause of the Constitution; (2) the fact that persons acquiring property on navigable streams have had 'ample notice over the years that such property is subject to a dominant public interest'; and (3) the common law of England. A comparison between the servitude doctrine and the English law gives persuasive weight to the conviction that the doctrine has its roots in antiquity. Under English law the King controlled navigable watercourses and treated then as his own. English waters later became classified either as public or as private. Fishing and navigation rights existed in connection with English waters and the submerged beds. Crown rights in tidal waters could be conveyed only with the permission of Parliament. (Heckerling-Florida)
W70-00081

THE COMMON LAW RIGHT OF THE PUBLIC TO NAVIGATE IN PRIVATE WATERS; STATUS OF STATE CREATED RIGHTS,
Richard S. Harnsberger.
IN Eminent Domain and Water Law. Neb L Rev, Vol 48, No 2, p 442-455, Jan 1969. 14 p.

Descriptors: *Eminent domain, *Public rights, *State jurisdiction, *Navigable waters, Navigation, Federal government, Judicial decisions, Water-

courses (Legal), Compensation, Irrigation, Consumptive use, Water law, Legal aspects, Tidal waters.
Identifiers: *Navigational servitude.

A public right to navigate was recognized in the American Colonies. After adoption of the Constitution, the federal government became the preserver of the privilege of free passage. The United States Supreme Court made certain basic modifications of the common law to accommodate the conditions and topography of the country, but the concept continued that waters navigable in fact were public as to use. At the state level, power may be exercised either under the doctrine that the ownership of water is held in trust for the people or under the doctrine of navigational servitude. A subcommittee of the American Bar Association reported that the servitude doctrine has inhibited the development of waterfront areas over navigable waters by private enterprise. Another important problem relates to the effect of the servitude upon diversions for irrigation, municipal supplies, and other consumptive uses. Congress may exercise less than its entire power and in the past has frequently recognized state law. In recent years, numerous efforts have been made to subject the federal government to state water law. In view of the plenary power of the United States, the matter of compensability is almost entirely a matter of Congressional policy. (See also W70-00070). (Heckerling-Florida)

HIGHWAYS, BRIDGES, AND FERRIES-PROVISIONS FOR PARTICULAR COUNTIES.

SC Code Ann secs 33-1467, 33-1469, 33-1485, 33-1705, 33-1711, 33-1741, 33-1758, 33-1783 (1962).

Descriptors: *South Carolina, *Highways, *Bridges, *Local governments, Road construction, Right-of-way, Legislation, Manpower, Engineering personnel, Labor, Personnel, Rivers, Culverts, Regulations, Bridge construction, Bridge design, Transportation, State governments, Civil engineering, Costs, Financing, Legal aspects.

The governing body of Charleston County may sell any rights-of-way, roads, or bridges standing in the name of the county. Such governing body may pass regulations to prevent improper drainage pipes from being placed along county roads and shall insure adequate drainage along all county roads. The bridge fund of Cherokee County shall be expended in maintenance of bridges and culverts in various townships. The governing body of Hampton County shall not let by contract the construction or repair of any bridge which can be done by a chain-gang force. Anyone operating a vehicle who damages a bridge in Horry County shall report the fact immediately or be subject to a fine. The governing body of Lancaster County shall have authority over all highways and bridges and may construct new ones as needed. The county shall, by the chain-gang or other means, keep all highways and bridges in proper repair. One mill of the 5 mill levy on property shall be for the construction of permanent bridges which shall be constructed of reinforced concrete or steel. No one shall close a road, bridge, or ferry in Lexington County without the permission of the governing body. (Helwig-Florida)

LOMBARD PARK DIST V CHICAGO TITLE AND TRUST CO (AUTHORITY TO MAP FLOOD PLAIN ZONING).
IN Eminent Domain and Water Law. 245 NE2d 298-303 (Ill App Ct 1969).

Descriptors: *Illinois, *Flood plain zoning, *Geologic mapping, *Condemnation value, Judicial decisions, Zoning, Regulation, Flood plains, Geomorphology, Building codes, Legal aspects, Mapping, Contours, Maps, Data collections, Surveys, Condemnation, Eminent domain, Compensation.

In a condemnation proceeding, a map was introduced to show that the property in question was in a flood plain area where residences could not be built. The map was admitted as an official public document and an exception to the hearsay rule. Generally, public records come within the exception if required either by statute or authorized to be maintained by the nature of the office, and if they concern matters to which the official charged with preparation could testify if called as a witness. The map in question was a study of a wide array of hydrologic data to evaluate the depth and frequency of flooding and was prepared by the U. S. Geological Survey. The court held that admission of the map was prejudicial to the judgment and reversible error. There was no showing of statutory authority to determine flood plains nor was it incidental to examining geological structure and mineral resources. The legend on the map did not include the property in question within the plain of overflow, nor was the data proven to be sufficiently reliable or such that the preparing official could have testified as to its nature. (Douberley-Florida)

UNITED STATES V MORAN TOWING AND TRANSP CO (LIABILITY FOR OBSTRUCTION OF NAVIGABLE WATERS).
409 F2d 961-963 (4th Cir 1969).

Descriptors: *Navigable waters, *Damages, *Federal government, *Remedies, Judicial decisions, Legal aspects, Maryland, Legislation, Navigation, Harbors, Docks, Costs, United States.
Identifiers: *Drydocks, Obstruction of navigation.

In calm seas and clear weather defendant's floating drydock took on water and foundered while under tow. The wreck obstructed navigation, and the United States took action to recover cost of removal from the owner and towing company. The district court found for the United States on grounds that the drydock was not a 'vessel' or 'craft' under the scope of 33 USCA section 409, which relieves the owner of liability unless the sinking is intentional, and held that the owner was responsible for removal. This court reversed, holding the drydock to be within the meaning of section 409. On appeal, the Supreme Court found that in addition to the in rem rights conferred by section 409, the United States had a right in personam to recover for removal of a vessel negligently sunk and remanded the case to consider this aspect. The court here remanded the case to hear evidence relevant to the negligence issue and to make new findings. Because of the then existing interpretation of section 409, the negligence issue had not been adequately considered by the district court in its initial determination. (Douberley-Florida)

IOWA NATURAL RESOURCES COUNCIL V MAPES (INJUNCTIVE ABATEMENT OF AN UNAUTHORIZED STREAM OBSTRUCTION).

164 NW2d 177-180 (Iowa 1969).

Descriptors: *Iowa, *Streamflow, *Natural flow, *Obstruction to flow, Channel flow, River flow, Channels, Diversion, Dams, Levees, Routing, Streams, Water law, Administrative agencies, Abatement, Flow control, Riparian rights, Riparian land, Legislation, Civil engineering, Judicial decisions, Legal aspects.
Identifiers: Injunction (Mandatory), Nuisance.

Defendants, riparian owners, built a dam which together with a new channel straightened a branch of a river flowing through their property. They did the construction without making the necessary statutory application. Plaintiff Iowa Natural Resources Council sought a mandatory injunction prohibiting defendants from maintaining the obstruction on the basis that the requisite permission had not been obtained for the dam's construction. The trial court dismissed the action. The supreme court affirmed, holding that the Council failed to establish the necessary statutory nuisance so as to entitle it to relief by injunctive abatement. Failure to comply with the statute requiring permission to construct a dam will not per se require injunctive abatement without a clear showing of a nuisance or other situation that requires an injunction. BOERNER V MCCALLISTER (NAVIGABLE STREAMS).

197 Va 169, 89 SE2d 23-28 (1955).

Descriptors: *Virginia, *Navigable rivers, *Ownership of beds, Judicial decisions, Boundaries (Property), Navigable waters, Rivers, Streams, Riverbeds, Navigation, Non-navigable waters, Riparian rights, Streambeds, Water law, Fishing, Saw log test.
Identifiers: Trespass, Navigable in fact, Injunctions (Prohibitory).

Defendant trespassed on plaintiff's land to fish in a non-navigable stream. Plaintiff's title to the land was originally granted by the crown and included title to the stream bed, there being no law at the time to prevent the conveyance of river beds. Plaintiff sought to enjoin defendant from trespassing and from fishing in the river. Defendant contended that the river was navigable in fact and open to public use. Beds of non-navigable streams are owned by the riparian owner. The question of navigability is factual. The test being whether the stream is susceptible of being used as a highway for commerce. The burden of proving navigability is upon the one asserting such. The court held that a showing of one unsuccessful effort to float logs during a flood did not carry the burden of proof. The landowner was held to be entitled to a permanent injunction. (Helwig-Florida)

CONDEMNATION BY COUNTY OR CITY FOR FLOOD CONTROL.
Ky Rev Stat Ann sec 104.010 (1963).

Descriptors: *Kentucky, *Flood control, *Cities, *Condemnation, Legislation, Judicial decisions, Legal aspects, Adjudication procedure, Condemnation value, Land tenure, Real property, Local governments.

Whenever the fiscal court of any county determines that any interest in real property is needed for the purposes of flood control and the fiscal court cannot acquire such interest by agreement with the owners, the fiscal court shall adopt a resolution setting forth the foregoing facts and ordering the condemnation of the required property. The legislative body of any city shall have the same power to condemn real property for flood control purposes as is given to the fiscal court. This section is intended to constitute an alternate method of acquiring property for flood control purposes, in addition to, and not as a substitute for, any other method authorized by law. (Heckerling-Florida)

HESSE V STATE CONSERVATION COMM (IMMUNITY FROM SUITS AGAINST STATE AGENCIES AND SOIL CONSERVATION DISTRICTS).
168 SE2d 293-298 (W Va 1969).

Descriptors: *West Virginia, *Administrative agencies, *Remedies, *Riparian rights, Damages, Land tenure, State governments, Soil conservation, Jurisdiction, Flood protection, Easements, Right-of-way, Access routes, Water law, Dams, Dam construction.
Identifiers: *Soil conservation districts, Injunctions (Mandatory).

Plaintiffs owned land through which a small stream flowed. The state Soil Conservation Committee owned the tract above plaintiffs' land. The Committee granted an easement to the Potomac Valley Soil Conservation District to come upon its land to construct a dam. Since the only access to the dam site was over plaintiffs' land, the Committee obtained a temporary injunction against plaintiffs' interferring with the proposed construction. In order to get heavy equipment to the site, the construction company widened the right of way across plaintiffs' land. Subsequently the court dissolved the temporary injunction and limited the access to the original right of way. Plaintiffs then filed two suits to recover damages and enjoin construction of the flood-prevention dam which plaintiffs claimed would interfere with their lower riparian rights. In answer to certified questions from the court in which the suits were filed, the Supreme Court of Appeals of West Virginia held the Committee to be a state agency having immunity from suit. The court held that the Soil Conservation District could be sued, however, since it was not statewide, but local in scope and nature. The court further found proper venue to be any county within the district. (Harris-Florida)

SUNHILL WATER CORP V WATER RESOURCES COMM'N (REVIEW OF WATER RESOURCES COMMISSION GRANT TO SUPPLY WATER).

301 NYS 2d 935-938 (1969).

Descriptors: *New York, *Water supply, *Administrative decisions, *Permits, Water works, Facilities, Potable water, Water storage, Judicial decisions, Wells, Utilities, Administrative agencies, Water demand, Water policy, Water requirements, Municipal water.

Petitioner, a private domestic water corporation, sought approval from the Water Resources Commission of a plan to supply water to a subdivision. Petitioner's supply system consisted of mains, two 1,000-gallon-per-minute wells, and two 15,000 gallon hydropneumatic storage tanks. The Commission rejected petitioner's plan, concluding that it was not justified by public necessity and that the Suffolk County Water Authority should continue to serve the area with its system of 22 wells, a storage capacity of 5.5 million gallons, water testing facilities, and maintenance crew. On review of the Commission order, the New York Supreme Court held that the conditions attached to the original grant to the Suffolk County Water Authority that they not enter competition with, or parallel the distribution of, any existing waterworks system had not been violated since petitioner was not then in existence or legally assigned to service the subdivision in question. The commission's order was affirmed, and the county water authority was allowed to continue supplying water to the subdivision. (Harris-Florida)

FISH AND WILDLIFE RESOURCES.
Ky Rev Stat Ann secs 150.010-150.025 (1963), as amended, (Supp 1968).

Descriptors: *Kentucky, *Wildlife conservation, *Resource development, *Administrative agencies, Fish conservation, Legislation, Legal aspects, Fish, Wildlife, Resources, Fishing, Dams, Impounded waters, Navigable waters, Regulation, Conservation, Recreation, Eminent domain, Water policy, Water resources development, Natural resources, Wildlife management.
Identifiers: *Wildlife resources, Public waters.

Included among the terms defined are: 'angling', 'impounded waters', 'navigable waters', 'public waters', 'regulation', 'wildlife', and 'fishing.' 'Navigable waters' are any waters within the state under lock and dam. 'Public waters' are all waters within the state flowing a natural stream channel or impounded on a natural stream. The term 'impounded waters' includes any public waters backed up behind a dam including all water upstream from the dam to the first riffle or shoal. It is state policy to protect and conserve wildlife so as to insure a permanent and continued supply of wildlife resources for the purposes of furnishing sport and recreation. The Department of Fish and Wildlife Resources is established to enforce the laws and regulations adopted under this chapter relating to wildlife and will exercise all powers necessarily incident thereto. The administrative organization and workings of the Department are set out; a commission is created to transact the business of the Department. The commission has extensive regulatory powers enabling it to provide for the conservation of the wildlife of the state. (Keith-Florida)

COUNTY BRIDGE CONSTRUCTION.

Ind Ann Stat secs 36-1901 thru 36-1912 (1949), as amended, (Supp 1968).

Descriptors: *Indiana, *Bridges, *Tunnel construction, *Local governments, Bridge construction, Cities, Streams, Legislation, Highways, Repairing, Grading, Construction, Highways, Tunnels, Navigable waters, Financing, Cost allocation.

The board of commissioners of any county shall direct the repair or construction of highway bridges when required by public convenience. The boards may purchase any toll bridge or buy any interest

therein. Whenever any bridge company abandons any bridge or when the right to take toll has expired, the boards may require the bridge and the grade leading thereto to be repaired. The board of commissioners of every county shall cause all bridges to be kept in repair. The boards may build or repair any bridge within the city limits of any city or town, but the rights of such city or town to build or repair bridges are not thereby impaired. The boards may construct a tunnel under a navigable stream in lieu of a bridge. Any county having three or more second class cities may pay up to fifty percent of the cost of repair, reconstruction, or replacement of any damaged bridge which serves as a main means of ingress and egress for such a city, provided fifty percent of such cost is raised by popular subscription. City and county officials may establish a cumulative bridge fund. (Smith-Florida)

FERRIES ON STREAMS BORDERING STATE.
Ind Ann Stat secs 36-2501 thru 36-2513 (1949), as amended, (Supp 1968).

Descriptors: *Indiana, *Regulation, *Permits, *Transportation, Administrative decisions, Administrative agencies, Maintenance, Rivers, Streams, Lakes, Ohio River, Damages, Legal aspects, Legislation, Rates, Local governments, Navigation, Boats.
Identifiers: *Penalties (Criminal), *Ferries, *Ferry regulation.

A license must be acquired from the appropriate county or city officials before any public ferry may be operated on a stream connecting Indiana with any point without the state. Applicants for licenses must post public notice of their application. The respective officials may issue five-year licenses provided the licensee posts a bond which will insure regular ferry service and maintenance. Unlicensed ferriage across the Ohio or Wabash rivers subjects one to pay damages to the licensed ferry unless enumerated circumstances exist. Cities issuing ferry licenses are authorized to fix rates, set rules of operation, and schedule the operations of said ferries. Licenses may be vacated by the cities granting them if cause is shown. Licensees who violate either city or county license conditions shall be guilty of a misdemeanor and subject to a fine upon conviction. (Holt-Florida)

INDIANA STATE TOLL BRIDGE COMMISSION.

Ind Ann Stat secs 36-3002, 36-3004, 36-3005, 36-3006, 36-3006a, 36-3007 (1949), as amended, (Supp 1968).

Descriptors: *Indiana, *Bridges, *Administrative agencies, *Interstate rivers, Administrative decisions, Bridge construction, Rivers, Streams, Legislation, Public benefits, Riparian rights, Investigations, Eminent domain, United States, Condemnation, Interstate, Appropriation.
Identifiers: *Ferries.

The Indiana State Toll Bridge Commission is authorized and empowered to construct and/or acquire by purchase or condemnation highway bridges and their approaches over and across any river or stream bounding the state whenever said bridge or approach will extend into Indiana. This act applies notwithstanding the fact that such stream is partially or wholly within a bordering state. The Commission is authorized to make investigations to determine if the above constructions or acquisitions would be in the public interest. To facilitate such investigations, engineers and other professionals may be retained. When and if the Commission determines that construction or acquisition of an interstate bridge is in the public interest, they shall make a resolution declaring such determination. The Commission is authorized to purchase all lands and riparian rights necessary for construction or acquisition of said bridges. The Commission shall purchase at a fair price any ferry that has operated continuously for 15 years within 2 miles of a proposed bridge site. The Commission is given the power of eminent domain. (Holt-Florida)

SEWERS AND DRAINS IN CITIES AND TOWNS.

Ind Ann Stat secs 48-3915 thru 48-3923 (1963).

Descriptors: *Indiana, *Sewage, *Drainage systems, *Sewage disposal, Legislation, Legal aspects, Cities, Leases, Contracts, Construction, Maintenance, Drains, Sewers, Cost allocation, Bids, Taxes, Assessments, Pumping plants, Water purification, Public health, Environmental sanitation, Financing, Projects, Administration.
Identifiers: *Joint projects.

Any city or town may build or otherwise acquire a general sewage system together with all the property rights and privileges connected therewith; cities and towns may also purchase or lease other lands for erecting pumping stations or other buildings in connection with said sewage system. Methods of financing, voter approval, and payment of taxes for such systems are specifically enumerated. The terms 'sewer', 'drain', 'sewerage and drainage system' and 'drainage or sewerage facilities' are construed to mean and include any local, main, collateral, connecting or interceptor sewer or drain, or any system, works, plant or other structure necessary for the collection, treatment, filtration, purification or sanitary disposal of the sewage and drainage of such cities and towns. Provision is made for the joint acquisition or construction of sewage systems or parts thereof by adjoining cities; the administrative procedures to be used in reaching agreement, cost allocation, bid advertisement, contract letting and financing for all such joint efforts are provided. (Keith-Florida)

INTERSTATE PORT DISTRICT OF ILLINOIS AND INDIANA.

Ind Ann Stat secs 68-401 thru 68-405 (1961).

Descriptors: *Port authorities, *Interstate commissions, *Illinois, *Indiana, State governments, Harbors, Great Lakes Region, Lake Michigan, Mississippi River, Programs, Administrative agencies, Legislation, Interstate compacts, Transportation, Navigation, Breakwaters, Engineering structures.
Identifiers: *Commercial development, Water terminals, Port and waterway development, Port districts.

This act witnesses a compact between Indiana and Illinois that creates a governmental body to coordinate port and waterway development programs in the Chicago-Lake Michigan area. Within the agreement's thirteen articles are provisions for the jurisdiction, specific powers, and duties of the port authority. The port district consists of the waters of Lake Michigan within the respective boundaries of the two states and all of the rivers common to the states, including all harbors, piers, breakwaters, and structures therein. The port authority is given the power to acquire, own, construct, lease, operate, and maintain such port and water terminal facilities as are specifically authorized by the legislature of either state. The duties of the port authority are to study, prepare, and recommend by specific proposals such changes and modifications as may be required to develop and maintain a full development of commerce in the port district. Both states pledge mutual cooperation and agree to share the expenses of the port authority except for the creation of a terminal facility within one of the states. (Schram-Florida)

INDIANA PORT COMMISSION.

Ind Ann Stat secs 68-1201 thru 68-1227 (1961), as amended, (Supp 1968).

Descriptors: *Indiana, *Port authorities, *Construction, *Financing, Federal government, Lake Michigan, Riparian rights, Harbors, Canals, Canal construction, Docks, Capital costs, Construction costs, Government finance, Eminent domain, Taxes, Income, Transportation, Legal aspects, Legislation, Planning, Public utilities, Administrative agencies.

The Indiana Port Commission is a five-member commission appointed by the Governor to construct a modern port with terminal facilities for all forms of transportation on Lake Michigan and/or on the Ohio River in designated counties. The Commission is authorized to issue revenue bonds to finance construction. The general powers of the Commission include: (1) the preparation of plans and contracts for port facilities; (2) the acquisition of land by purchase, lease, and eminent domain; (3) the relocation of public roads, railroad and public utility facilities which shall be payable as costs of construction; (4) the issuance of port revenue bonds, which are not to be considered debts of the state; and (5) the setting of fees and charges. All income is to be considered trust funds for port purposes. The Commission and its bonds are given certain tax exemptions. The Commission is authorized to apply for permission to operate a foreign-trade zone and to construct canals and waterways. (McDonough-Florida)

FISHING THROUGH ICE HOLES.
Ind Ann Stat secs 11-1615, 11-1615a (Supp 1968).

Descriptors: *Indiana, *Fishing, *Regulation, *Ice fishing, Legislation, Legal aspects, Permits, Lakes, Rivers, Streams, Structures, Obstruction to flow, Fishing gear, Permits, Water utilization, Fish conservation, Water conservation.
Identifiers: Penalties (Criminal), Fishing licenses.

It is unlawful to fish in any of the lakes, rivers, or streams of the state through more than two holes in the ice at one time or through a hole more than twelve inches in diameter. Any structure used in such fishing must meet specified requirements and must be removed from the ice before the ice melts. Fishing licenses and permits issued to nonresidents whose home states do not allow nonresidents to fish through the ice shall not be deemed to permit the holder thereof to fish through the ice. Violators of this provision are subject to criminal penalties. (Keith-Florida)
W70-00117

FISH LADDERS - REGULATIONS.

Ind Ann Stat secs 11-1617, 11-1618 (1956).

Descriptors: *Indiana, *Fish ladders, *Dams, *Regulation, Legislation, Rivers, Watercourses (Legal), Cities, Construction costs, Maintenance, Legal aspects, Repairing, Fish migration.
Identifiers: Liens.

The owners of any dam which is over four feet in height and which crosses any watercourse of this state shall construct and maintain fish ladders on such dam to allow fish below the dam to travel to the waters above the dam. If the owner does not erect the ladders, the trustee of the township where the dam is located may construct such ladders, and the cost shall constitute a lien on the dam. If the owner continues to refuse to pay the cost of the ladders, the trustee may sue to recover the amount and may foreclose the lien on the dam. The owners shall be required to keep the ladders in good repair. The trustee of the township, after 30 days notice to the owner, may make such repairs if the owner fails to do so. He may recover the costs as provided above. It shall be unlawful to fail to repair the fish ladders required under these provisions. (Heckerling-Florida)
W70-00118

MUSSELS - REGULATIONS.

Ind Ann Stat secs 11-1644 thru 11-1648 (1956).

Descriptors: *Indiana, *Mussels, *Wildlife conservation, *Regulation, Legislation, Wildlife management, Commercial shellfish, Shellfish, Fishing gear, Beds under water, Breeding, Commercial fishing.
Identifiers: Breeding grounds.

No person shall catch, possess, or sell any mussel less than two inches in size. Any mussel smaller than the above size shall be culled and immediately returned to the water. Only one boat or rig for taking mussels may be operated by one person at any time. No crowfoot bar, dredge, fork, shovel, or spade, or any other device used in scraping, digging, spading, or otherwise disturbing the bed of any waters, shall be used in taking mussels from April 1 through June 13. The Wabash River shall be exempted from this section for purposes of the use of the above devices. It shall be unlawful to have more than the herein prescribed numbers of certain devices used in taking mussels. Certain waters may be designated as breeding grounds for mussels from which mussels shall not be taken for designated periods of time. Limits are prescribed for the sizes of breeding grounds. Notice of such regulation shall be made public in the prescribed manner. No person shall take or kill mussels in any area or parts of the waters of this state closed during the time prescribed by regulation. (Heckerling-Florida)
W70-00119

OPEN SEASON AND BAG LIMITS.

Ind Ann Stat secs 11-1701 thru 11-1708 (1956).

Descriptors: *Indiana, *Regulation, *Wildlife conservation, *Administrative decisions, Legislation, Legal aspects, Fish, Frogs, Mussels, Reproduction, Conservation, Fish conservation, Lakes, Streams, Rivers, Ponds, Bodies of water, Administrative agencies, Wildlife, Wildlife management.
Identifiers: *Open seasons, *Bag limits, Penalties (Criminal).

Seasons and limits on fish, frogs, mussels, game, fur bearing animals and game birds, as well as regulations for the taking and killing thereof are established. The Director of the Department of Conservation may, however, modify such seasons, limits, and regulations in the interest of wildlife conservation. Any decision of the Director to modify statutory seasons, limits, and regulations must be based on an investigation reflecting the production, preservation, and propagation of the species involved. Criminal penalties are provided for the violation of any regulation or order of the Director. The term 'waters' is defined to include any lake, stream, river, pond, or body of water and all chains, systems, or combinations thereof within the state. (Keith-Florida)

STATE COOPERATION IN FEDERAL WILDLIFE CONSERVATION PROJECTS.

Ind Ann Stat secs 11-1901 thru 11-1902, 11-1904 (1956).

Descriptors: *Indiana, *Fish reproduction, *Migratory birds, *Wildlife conservation, Legislation, Legal aspects, Drainage, United States, Federal government, Jurisdiction, Fish conservation, Administrative agencies, Permits, Treaties, Lakes, Streams, Multiple-purpose projects, Federal reservations, Conservation, Project purposes, Water policy, Federal project policy.
Identifiers: *Fish restoration, *Federal-state cooperation, Federal projects.

The United States may acquire such lands and water in the state as it deems necessary for the establishment of migratory-bird reservations in accordance with the federal migratory-bird treaty of 1929. The treaty's purpose is to lessen the dangers threatening migratory game birds from drainage and other causes. The United States commissioner of fisheries may conduct fish hatching operations and related investigations within the state in order to promote fish culture and to increase the number of useful food and game fishes in the lakes and streams of the state. The state assents to an act of Congress providing for aid to the states in fish restoration and other management projects. The director of the division of fish and game may perform such acts as may be necessary to establish cooperative fish restoration projects. No funds accruing to the state from fishing license fees may be diverted for any other purpose than the administration of the division of fish and game and for the protection, propagation, and investigation of fish and game. (Keith-Florida)
W70-00121

WATERCOURSES - CANALS - TOLL BRIDGES.

Ind Ann Stat secs 26-1413 thru 26-1417 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Channel improvement, *Stream improvement, *Cleaning, Obstruction to flow, Canals, Appropriation, Repairing, Legislation, Non-navigable waters, Channels, Financing, Administrative agencies, Local governments, Costs, Maintenance costs.
Identifiers: Toll bridges, counties.

The Board of County Commissioners of any county may, for the purpose of navigation, appropriate money for canal repair. The Board may purchase any toll bridge or private interest therein. Upon petition by owners of frontage land bordering on any non-navigable stream requesting that a specified portion of such stream be cleaned or improved to provide adequate capacity, the Board shall refer such petition to the county surveyor for examination. The Board may also determine, in the absence of petition, that such stream needs cleaning or improving. After a hearing, the Board may provide that necessary work be performed by the county or let for contract. Commencement of such work is subject to approval of the County Council which shall make an appropriation to cover the costs thereof. This act shall not apply to ditches or drains already established by a court and for which a maintenance district exists. Where the non-navigable stream forms a boundary between two counties, the petition to improve shall be filed with both counties. The boards of the counties shall proceed in joint action and the costs shared equally. (Marsee-Florida)

MAINTENANCE OF DAMS, LEVEES AND FLOOD CONTROL WORKS.

Ind Ann Stat secs 27-1801 thru 27-1808 (Supp 1968).

Descriptors: *Indiana, *Flood control, *Operation and maintenance, *Flood protection, Diversion structures, Dams, Levees, Construction, Water management (Applied), Watershed management, Planning, Engineering structures, Dam construction, Design, Costs, Construction costs, Assessments, Taxes, Inspection, Surveys, Legislation, Legal aspects.
Identifiers: Penalties (Criminal).

The owner of any dam, levee, dike, or floodwall and appurtenant works must keep the structure in repair and/or satisfactory operating condition. The Indiana Flood Control and Water Resources Commission is charged with supervision over the status of repair of such structures and may make rules and regulations for their maintenance and operation. The Commission may vary these standards where location of the structure or particular hazzards involved so require. The Commission is directed to make annual engineering inspections of all dams, levees, dikes, and floodwalls with certain exceptions noted in the statute. The Commission may order such repairs or reconstruction of defective works as are required to meet its standards. In emergencies, where life and property are endangered, the Commission may take steps to provide

emergency protection and may recover the costs for same from the owner. Refusal to comply with Commission repair orders may subject the owner to prosecution for a misdemeanor. The Commission may enter land for engineering inspections without liability for trespass and is exempt from liability for injury arising from faulty construction or repair of dams and other works or from issuance and enforcement of any lawful order. (Kelly-Florida)

RESERVOIR SITES FOR STORAGE OF WATER.

Ind Ann Stat secs 27-1901 thru 27-1908 (Supp 1968).

Descriptors: *Indiana, *Water conservation, *Water management (Applied), *Water storage, Water yield improvement, land use, Easements, Water demand, Water utilization, Reservoirs, Reservoir operation, Water allocation (Policy), State governments, Legal aspects, Legislation, Water sources, Costs, Flood control, Water control, Water resources, Condemnation, Administrative agencies, Local governments.

Municipalities, Taxing districts, and public utilities may secure reservoir sites for future needs which are determined by factors including growing domestic and other uses of water, pollution control, and flood control and prevention. The state Flood Control and Water Resources Commission is empowered to purchase or condemn lands or interests in land for reservoirs and to construct structures for water impoundment. This may be done on behalf of the state or any municipality, taxing district, or public utility which has the right and duty to store water for purposes stated in this statute. The owner of any land from which an easement or remainder interest is taken may use the land for recreational, agricultural, or other purposes, subject to the dominant purpose of water storage. The state Board of Health and the Commission must approve the taking of land for the purposes of this act by any party other than the Commission. (Kelly-Florida)
W70-00130

INDIANA DRAINAGE CODE - DRAINAGE BOARDS - POWERS AND DUTIES.
Ind Ann Stat secs 27-2001 thru 27-2017 (Supp 1968).

Descriptors: *Indiana, *Drainage programs, *Drainage practices, *Planning, Operation and maintenance, Maintenance, Construction, Construction costs, Maintenance costs, Assessments, Regulation, Design standards, Specification, Local governments, Legislation, Drainage engineering, Surveys, Surface drainage, Legal aspects, Classification, Administrative agencies, Administration, Repairing.
Identifiers: *Drainage boards.

County drainage boards are established in each county of the state. Membership includes county commissioners, the county surveyor, and a city engineer in appropriate cases. The county surveyor is the technical authority on construction and maintenance of all legal drains in the county and is responsible for investigation and planning of needed improvements and for preparing standards of design, construction, and maintenance applicable to all legal drains. The surveyor must supervise all work on improvements and maintain complete records concerning all legal drains in the county. The surveyor is charged with maintaining a classification system of all drains in the county with regard to maintenance and reconstruction needs and desirability of vacating drains. The statute sets forth criteria for classification, gives examples of types of needed repair which may be made, and outlines the manner in which repair or vacating may be accomplished. Costs of public drain improvements may be assessed against benefited land owners, the pro rata share to be determined by the board. A joint board will preside over proceedings involving improvements affecting land in two or more counties. (Kelly-Florida)
W70-00131

CONSTRUCTION OF DRAINS.

Ind Ann Stat secs 27-2101 thru 27-2166 (Supp 1968).

Descriptors: *Drains, *Indiana, *Drainage engineering, *Drainage programs, Drainage practices, Drainage, Land management, Costs, Construction costs, Drainage effects, Surface drainage, Drainage systems, Cost allocation, Damages, State governments, Local governments, Legal aspects, Legislation, Planning, Cost-benefit theory, Estimated costs, Construction, Maintenance, Administrative agencies, Maintenance costs, Administration, Surveys, Assessments.

Where establishment of a new legal drain cannot be easily accomplished without affecting other property, owners of land affected by the proposed improvement may petition the drainage board for the establishment of the new drain. Petitions may also be filed by county commissioners for highway drainage, by school trustees for drainage of public school grounds, or city officials for drainage with the corporate limits. The statute sets forth the necessary content of the petition, procedure for filing, and procedure to be followed by the board in hearing, investigating and deciding petitions. The county surveyor shall, at the board's request, determine the type of drainage structure to be used, prepare plans for construction, and determine costs. The board may, after proper hearings, assess costs against the benefited landowners. The board may refer to the surveyor those drains in need of reconstruction or those drains in need of periodic maintenance for reports by him concerning plans for reconstruction or maintenance, and estimates of costs, including damage awards, which may be assessed against benefited landowners after public hearings. (Kelly-Florida)
W70-00132

DRAIN IMPROVEMENT.
Ind Ann Stat secs 27-2401 thru 27-2420, 27-2501 thru 27-2507 (Supp 1968).

Descriptors: *Indiana, *Drainage systems, *Costs, *Local governments, Drainage, Ditches, Drainage programs, Drainage districts, Controlled drainage, Maintenance, Maintenence costs, Construction costs, Replacement costs, Cost allocation, Cost-benefit analysis, Cost sharing, Legislation, Assessments, Tile drains, Financing, Operation and maintenance.

There is created in each county a general drain improvement fund which shall be used to pay the cost of constructing, reconstructing, or maintaining a legal drain. A maintenance fund is created for each legal drain. The county auditor shall set up a separate account for each drain and shall assess the lands benefited for the periodic maintenance costs. When even the cost of maintaining any tile drain does not exceed one hundred dollars, such drain may be exempted from this act, and the costs shall be paid from the general drain improvement fund. Bonds may be issued and redeemed to finance such maintenance. The drainage board has the power to contract for improvement and maintenance work. The board shall apportion all costs to the several tracts of land benefited. A ditch assessment lien shall attach to the lands assessed on the date of certification of the final assessment. Whenever the cost is more than can be conveniently paid by assessment, the sale of bonds shall be authorized. Any owner of land affected by a final order of a drainage board shall be entitled to judicial review thereof. (Smith-Florida)

RIVER IMPROVEMENTS BY THE UNITED STATES.
Ind Ann Stat secs 62-1007, 62-1010 (1962).

Descriptors: *Indiana, *Navigable rivers, *Condemnation, *United States, Legal aspects, Legislation, Rivers, Locks, Dams, Chutes, Abuttments, Structures, Construction, Maintenance, Navigation, Jurisdiction, Ohio River, Banks, Federal government, Dam construction.
Identifiers: *River improvements.

The United States may acquire any property for the purpose of erecting thereon dams, abuttments, locks, lock-keepers' houses, chutes, and other structures necessary for the construction and maintenance of slack water navigation on navigable rivers. The consent of the state to such acquisition is contingent on the beginning by the United States of the improvement of a navigable river within or bordering upon the state. Such acquisition may be either by purchase or condemnation. The United States is granted specific permission to purchase any land on the banks of the Ohio or Wabash rivers provided that it is purchased to erect thereon structures necessary to the improvement of said rivers. CONSERVATION DEPARTMENT.

Ind Ann Stat secs 60-725a, 60-736, 60-737, 60-748 thru 60-750 (1962).

Descriptors: *Indiana, *Surface waters, *Water conservation, *Flood control, Legislation, Legal aspects, Artificial watercourses, Conservation, Condemnation, Eminent domain, Recreation facilities, Streams, Obstruction to flow, Lakes, Rivers, Water levels, Drainage, Navigable rivers, Navigable waters, Non-navigable waters, Administrative agencies, Public benefits, Federal government.
Identifiers: *Man-made lakes.

The Department of Conservation may acquire surface water rights on certain man-made lakes. With certain restrictions the Department may also acquire land adjacent to such man-made lakes for purposes of public access and recreation. The Department must approve all plans for flood control projects before work on them begins. The Department of Conservation by itself or in conjunction with the federal government must clean out, straighten, deepen, widen, remove obstructions from, and clear the banks of specified portions of the Little Calumet River. The Department is empowered to become a party to any legal action in any state court when such action affects the preservation or maintenance of the lakes, rivers, or streams of the state; all state courts must recognize this right of the Department. The definition of 'lakes' includes both meandered and unmeandered lakes, and the term 'rivers' is defined to include both navigable and nonnavigable rivers and streams. (Keith-Florida)
W70-00136

BANKS V CHICAGO MILL AND LUMBER CO (ACCRETIONS TO RIPARIAN LAND).

92 F Supp 232-242 (ED Ark 1950).

Descriptors: *Arkansas, *Accretion (Legal aspects), *Boundaries (Property), Judicial decisions, Bank erosion, Avulsion, Boundary disputes, Islands, Navigable rivers, Rivers, Shores, Banks, Riparian land, Riparian rights, High water mark, Water rights, Sedimentation, Stream erosion, Severance.

Both parties claim title to riparian land. Defendant's claim is based on evidence that the land had been formed as accretions to the bank of the river and subsequently separated therefrom by avulsive change of the river. Plaintiff claims that the land had moved from one bank of the river to the op-

posite by avulsion and later moved back by subsequent avulsion. A riparian owner whose land is added to by gradual and imperceptible accretion gains title to the new land. He also loses land washed away by gradual erosion. However, where a stream suddenly changes course by avultive action the riparian owner retains title to submerged land or island if one is formed. Avulsion causes no change in boundaries. The court found that the land in question formed by the gradual deposit of silt and sediment was later to be cut off from the bank by avulsion of the river establishing defendant's title. MUENCH V PUBLIC SERVICE COMMISSION (DELEGATION OF LEGISLATIVE POWER OVER MATTERS OF STATE-WIDE INTEREST).
261 Wis 492, 55 NW2d 40-48 (1952).

Descriptors: *Wisconsin, *Public benefits, *Navigable waters, *Public rights, Administrative agencies, Judicial decisions, Local governments, Dams, Dam construction, Navigation, Hunting, Fishing, Scenery, Legal aspects, Water law, Water policy, Competing uses, Governments, Recreation, Water allocation (Policy), Water resources development.
Identifiers: *Delegation doctrine.

Petitioner was granted a rehearing on a petition to review the decision of the Public Service Commission which authorized the construction of a dam. The issue on rehearing was the constitutionality of the statute under which the Commission had authorized said construction. Petitioner contended that the statute was void as an improper delegation of legislative power because it attempted to delegate to the county boards the power to determine the effects of dam construction on the public right to the enjoyment of fishing, hunting, and scenic beauty which are matters of state-wide not local concern. The court held this statute unconstitutional as an unlawful delegation of legislative authority and as constituting a complete abdication of the public trust doctrine under which the state holds all navigable waters in trust for the public. This trust extends to the use of such waters for fishing, hunting, and other recreational purposes, as well as to pure navigation. The right to hunt and fish are matters of state-wide concern over which the power to legislate cannot constitutionally be delegated to county boards. The previous mandate of reversal was affirmed. FISH AND GAME (FISHING REGULATIONS).

Ark Stat Ann secs 47-401 thru 47-420 (1964).

Descriptors: *Arkansas, *Fish, *Sport fishing, *Commercial fishing, Legislation, Regulation, Recreation, Fresh water fish, Fish, Bass, Perch, Salmon, Pikes, Trout, Minnows, Fishing equipment, Bait fishing, Nets.
Identifiers: *Penalties.

Arkansas regulations concerning game fish are set forth. Provisions concerning bait, minimum length, and string limit are provided. Minnow regulations include closed season provisions, exportation, seine and licensing restrictions. The use of hook and line, traps, gigs, spears, explosives, and intoxicating substances to take fish is restricted. Licensing and the use of seines, trammel and gill nets for commercial fishing are regulated. Provisions concerning the use of hoop, barrel, or pond nets and penalties for violations thereof are included. Specific geographic and date limitations on the use hoop nets and commercial troutlines, snag lines, gigs, or spears, together with licensing provisions are set forth. Predatory fish removal and control provisions are included. (Moulder-Florida)

Arkansas mussel takers and buyers must conform to certain regulations. An annual shell taker's license must be procured, under which the possessor may operate not more than one boat or rig for taking mussels plus one boat for towing. It is unlawful to use more than two crow feet bars or one dredge. Minimum size restrictions are set forth. In addition persons buying mussel shells must procure a license from the fish and game commission. Every person who runs a boat for the purpose of dealing in fresh-water mussel shells shall procure a license. The holder of a shell buyer's license must make an annual report to the fish and game commission. There is no severance tax. The Arkansas game and fish commission shall enforce these laws. The commission may also set up restricted areas where mussel fishing is prohibited. Penalties for infractions are provided. (Moulder-Florida)

Respondent state took a strip of land from appellant for purposes of a controlled access highway which left appellant with land on both sides of the highway. While appellant retained access to the land east of the highway, the superintendant of public works gave access to land west of the road only if appellant used such land for public water supply purposes. The court held that the landowner was entitled to consequential damages, but that access to the western portion of the property could be conditioned on the continued use of the land as a public water supply. WATERS AND WATERCOURSES - FISHING - RIGHT OF PUBLIC IN FLOATABLE STREAMS.
Mich L Rev, Vol 42, No 4, p 712-713, Feb 1944. 2 p, 5 ref.

Descriptors: *Michigan, *Navigable waters, *Ownership of beds, *Public benefits, Riparian rights, Fishing, Streambeds, Non-navigable waters, Relative rights, Prescriptive rights, Judicial decisions, Public rights, Easements, Competing uses, Legal aspects.
Identifiers: *Common law.

This comment is based on an action brought to compel the defendants to restore the bed of a stream flowing through their land to its former condition. The stream was thirty feet in width and averaged in depth approximately one foot. It had a flow of less than fifty cubic feet per second. The stream was not capable of 'commercial travel by any kind of boat', and it was doubtful whether it was 'practical to use a boat on it in fishing.' Although in logging days some loose timber had been floated down it, the stream could never be used to float logs without the use of dams. The court ruled that barriers and holes placed in the stream to prevent waders from entering defendants' land must be removed. Michigan law thus seems settled that the public right of fishing extends even to floatable streams, the beds of which are owned privately. Thus, Michigan and Wisconsin go against the common law rule that the right to fish follows ownership of the bed rather than navigability. Seemingly, capability of use for floating rather than actual use therefore is the determinative factor. (Schram-Florida)

FIRESTONE TIRE AND RUBBER CO V RITCHIE (CONDEMNATION PROCEEDINGS AGAINST PERSONALTY NOT AUTHORIZED).
168 SE2d 287-293 (W Va 1969).

Descriptors: *West Virginia, *Condemnation, *Remedies, *State governments, Administrative agencies, Flood damage, Highway relocation, Relative rights, Flooding, Shafts (Excavations), Judicial decisions.
Identifiers: *Sovereign immunity, Abandoned mines.

Plaintiff corporation leased a store in which it kept and sold large amounts of personal property merchandise. The state road commission of West Virginia entered a contract with a construction company to relocate a highway. In the process of relocating, the mouth of an abandoned mine was opened by excavations causing the release of impounded water which flooded plaintiff's leasehold, damaging its personal property. Since the state road commission, as a state agency, was immune to tort suit, plaintiff sought mandamus to compel the defendant commissioner to institute condemnation proceedings against plaintiff's damaged property. On appeal from an order upholding defendant's demurrer, the Supreme Court of Appeals of West Virginia held that although the state constitution provided that no private property be taken or damaged for public use without compensation, the provision was not self-executing. Since the legislature had only provided for condemnation of real estate, no condemnation proceeding would lie for personalty. The court indicated in dicta that plaintiff's only remedy would lie in a tort suit against the contractor. (Heckerling-Florida)
W70-00342

WATERS AND WATERCOURSES - PUBLIC RIGHT OF FISHERY AS AN INCIDENT OF NAVIGATION.

Minn L Rev, Vol 40, p 88-91, 1955. 4 p, 18 ref.

Descriptors: *Missouri, *Navigable waters, *Ownership of beds, *Public benefits, Streambeds, Riparian rights, Non-navigable waters, Fishing, Relative rights, Eminent domain, Prescriptive rights, Competing uses, Easements, Public rights, Judicial decisions, Legal aspects.
Identifiers: *Public easements.

Navigability and its effect on rights to watercourses is discussed in relation to a recent Missouri case. In that case, plaintiff fisherman requested a declaratory judgement to determine his right to fish in a river navigable in fact by small craft but not navigable in fact by larger boats. The court held that the river was nonnavigable under the Missouri test, and thus the riparian owner had title to the bed of the stream; but since it was 'floatable', such title was subject to a public easement of travel and passage by floating and wading, which includes the right of fishery. After discussing federal and state tests of navigability, the comment explores the issue of whether fishing is rightfully an incident of navigation. The basic contention is that it is possible to reach the same result as the present case by another rationale--the trust theory that title to fish is in the state and thus the public should have a right to take them regardless of who owns the stream beds. Additional theories that are mentioned are dedication, prescription, estoppel, and eminent domain. (Schram-Florida)

FISH AND GAME (LICENSES).

Ind Ann Stat secs 11-1401 thru 11-1406 (1956), as amended, (Supp 1968).

Descriptors: *Indiana, *Permits, *Regulation, Legislation, Administration, Recreation, Water sports, State governments, Fish, Sport fishing, Trout.
Identifiers: *Penalties (Civil), Licenses.

Hunting, fishing, and trapping licenses are required in Indiana. Upon payment of the applicable license fee, a specified amount of which is retained by the issuing officer, the license is issued. Any resident owner of farmland and his family may hunt and fish on land belonging to that owner without a license. Distinctions are drawn between residents and non-residents with regard to licensing fees. (Moulder-Florida)

HAYWARD V NOEL (ACTION FOR TRESPASS TO RIPARIAN LAND).

225 So 2d 638-642 (Ct App La 1969).

Descriptors: *Riparian rights, *Louisiana, *Real property, *Damages, Legal aspects, Judicial decisions, Land, Land tenure, Mississippi River, Relative rights, Rivers, Riparian land.
Identifiers: *Batture land.

Plaintiff brought this action to recover damages from trespass to his land. Defendants claimed ownership of plaintiff's land by title and adverse possession. The disputed land was a strip of batture land lying between the Mississippi River and a public road. Plaintiff's title was based on a reservation in a previous conveyance; the court ruled that the reservation was valid, that plaintiff's title was superior, and that plaintiff was entitled to recover damages. The court stated that a conveyance of property along a river conveys the riparian rights appurtenant therto, therefore a reservation of land along a river reserves those riparian rights. Iowa Code Ann secs 109.67, 109.70-109.86 (1949), as amended, (Supp 1969)

Descriptors: *Iowa, *Freshwater fish, *Fishing, *Fishing gear, Frogs, Fish, Sport fish, Fish conservation, Fish farming, Fish management, Fish stocking, Farm ponds, Commercial fishing, Baits, Nets, Minnows, Bait fishing, Mississippi River, Missouri River, Artificial watercourses, Legislation, Legal aspects, Regulation.
Identifiers: Throw lines, Trot lines, Fish limits

Open seasons, catch limits, possession limits, and minimum lengths or weights of various species of fish are set out in tables. Fish may be taken with hook, line and bait only, and limits are specified for number of lines and hooks per line. Limits are placed on the number, size, and areas of use of trot

and throw lines. Each trot line must be identified, must have one end visibly set from shore, and cannot be entirely across a waterbody. Unlawful methods of taking fish are listed. Except to provide breeding stock for farm ponds, the State Conservation Commission may not stock private waters unless such waters are open to the public for fishing. Lawful dimensions for minnow nets are provided. A license is required for taking minnows for commercial purposes. Minnows cannot be taken from trout streams, and the Commission may designate other areas as protected. Minnows cannot be taken outside the state for sale. The use of specified bait is prohibited. (Douberley-Florida)

Descriptors: *Fish, *Fishing, *New Hampshire, *Regulation, Fish reproduction, Fish conservation, Legislation, United States, Administrative agencies, Trawling, Nets, Fish management, Commercial fishing, Permits, Fisheries, Planning, Shellfish.

Seasons and limits may be established for the taking of certain varieties of fish. The use of seines, nets, or weirs is forbidden and trawling for codfish is outlawed. Only residents of the state who have a permit may take shellfish in designated areas. Marine species can be regulated and motor vehicles are prohibited from driving on clam flats. The Governor may appoint an advisory committee on shore fisheries, which will suggest plans for propagation and regulation of the taking of shellfish and shore fish to the Department of Game and Fish. The Director of the Department of Game and Fish shall cooperate with the United States Department of the Interior in carrying out congressional projects concerning fish and wildlife. SPORT FISHING.
Conn Gen Stats Ann secs 26-108 to 26-141 (1960), as amended, (Supp 1969).

Descriptors: *Delaware, *Sport fish, *Fish conservation, *Fish management, Legislation, Commercial fish, Fisheries, Fish hatcheries, Fishing, Fish barriers, Fish passages, Fish stocking, Regulation, Baits, Bait fishing, Reservoirs, Bodies of water, Administrative agencies, Poisons, Controlled drainage, Bridges, Seasonal, Legal aspects.
Identifiers: Fishing rights, Demarcation (Streams).

The State Board of Fisheries and Game determines dividing lines between inland waters and marine districts and lines dividing lakes from running streams. The Board regulates fishing and taking of bait in all inland waters and may issue regulations relating thereto that, among other things, establish seasons, size limits, legal taking methods, restricted areas, control boats, access areas, and trespass limits from the banks of waterbodies. Certain species of fish may not be sold commercially, and taking fish by means of explosives, drugs, and poisons is prohibited. Specific provisions cover limitations on specific fish species, use of certain waterbodies, and prohibited fishing methods, and penalties are provided for offenses, to include forfeiture of equipment. Regulations provide for stocking fish in public and private waters and for the use of these stocked areas. Bait species may not be taken for removal from the state, and restrictions are imposed on introduction of new bait species into the state. Provisions cover construction of fishways over dams and prohibition of commercial fishing near fishways. The Board also engages in fisheries management with power to operate necessary facilities. (Douberley-Florida)
W70-00409

SPORT FISHING.

Conn Gen Stats Ann secs 26-108 to 26-117 (1960), as amended, (Supp 1969).

Descriptors: *Delaware, *Sport fish, *Fish conservation, *Fish management, Legislation, Fish, Commercial fish, Freshwater fish, Fisheries, Fish hatcheries, Fishing, Regulation, Bodies of water, Permits, Administrative agencies, Watercourses (Legal), Legal aspects.
Identifiers: Demarcation (Streams).

Upon notice and hearing, the State Board of Fisheries and Game may determine lines in streams and bays dividing inland waters and marine districts. It also establishes demarcation lines dividing lakes or ponds from streams flowing in or out of them. The Board may regulate fishing and taking of bait in all inland waters, including regulations establishing seasons and special open hours, legal methods of taking fish, legal lenghts and limits, restricted fishing areas, permit requirements, and rules for use of power craft. It may also designate areas exclusively for women, children, or handicapped persons, provide for entrance and exit to waterbodies, establish trepass limits from banks, and prohibit trespassing, damage, swimming, picnicking, parking, and litter-

ing on property under control of the Board. Commercial use of certain species of fish is prohibited; otherwise this chapter does not apply to commercial fishing nor may its provisions interfere with the public water supply. Penalties for violations are provided, and each fish illegally taken is a separate offense. The Board engages in fisheries management and is authorized to spend federal funds for fish and pond improvement facilities. (Douberley-Florida)
W70-00410

SPORT FISHING.

Conn Gen Stats Ann secs 26-118 to 26-137 (1960), as amended, (Supp 1969).

Descriptors: *Delaware, *Sport fish, *Fish conservation, *Fish management, Legislation, Fish, Commercial fish, Freshwater fish, Fisheries, Fish hatcheries, Fishing, Fish barriers, Engineering structures, Dams, Fish passages, Fish ladders, Fish stocking, Regulation, Ice fishing, Farm ponds, Reservoirs, Bait fishing, Permits, Administrative agencies, Poisons, Toxins, Striped bass, Carp, Legal aspects.
Identifiers: Licensing.

Written permission must be obtained before fishing in reservoirs used for domestic water supplies. Use of explosives, drugs, and poisons for taking fish is prohibited. Specific limitations are placed on taking striped bass, on fishing in certain ponds, and through the ice. It is unlawful to take bait for transportation out of the state, except for hatcheries or private waterbodies, and permits must be obtained for introducing carp and goldfish into the state. The state may not stock areas in which the owner will not allow public fishing, except by sale of surplus stocks to the owner. If private waters are registered, the owner may take any fish without a license. Permission must be obtained before any stocking is done, and the Board of Fisheries and Game may regulate privately stocked waters upon request. Boats, tackle, and implements may be forfeited for violation of any of these rules and regulations. Obstructions to the passage of fish are prohibited except to prevent escape of stocked fish and to prevent fish from entering machinery flumes. Individuals may petition to have a fishway constructed on an artificial obstruction, and commercial fishing is prohibited near a dam or fishway. (Douberley-Florida)
W70-00411

SPORT FISHING.

Conn Gen Stats Ann secs 26-138 to 26-141 (1960), as amended, (Supp 1969).

Descriptors: *Delaware, *Fish conservation, *Fish management, *Drainage practices, Legislation, Fish, Commercial fish, Freshwater fish, Fishing, Regulation, Administrative agencies, Controlled drainage, Drainage effects, Bridges, Legal aspects.
Identifiers: *Fishing rights, Penalties (Criminal).

A waterbody may not be drained for the taking of fish. Any draining that might endanger fish life must be reported to the Director of the State Board of Fisheries and Game prior to draining. Fishing rights in streams crossing highways are in the abutting owner, condemnee, or grantor, unless fishing rights have been otherwise transferred and compensated for. The Highway Commissioner has full authority to regulate bridge fishing. Unless otherwise provided, maximum penalty for violating this act is $100 and 30 days imprisonment for each offense. (Douberley-Florida)

6G. Ecologic Impact of Water Development

ECOLOGICAL EFFECTS OF WEATHER MODIFICATION: A PROBLEM ANALYSIS.
Michigan Univ., Ann Arbor. Dept. of Resource Planning and Conservation.
Charles F. Cooper, and William C. Jolly.
University of Michigan, School of Natural Resources Report, May 1969. 160 p, 140 ref. 14-06-D-6576 (Bureau of Reclamation, Office of Atmospheric Water Resources).

Descriptors: *Weather modification, *Ecology, Wildlife, Aquatic habitats, Silver iodide, Insect invasion, Weeds, Plant diseases, Monitoring.

If deliberate modification of weather can be achieved, the structure of plant and animal communities may be altered through shifts in rates of reproduction, growth, and mortality of weather sensitive species. Weather modification may interact with other ecological stresses such as air pollution and pesticide application to produce changes greater than the sum of the individual effects. The argument is rejected that because the change anticipated from weather modification is smaller than the normal variability of weather, weather modification will have little or no biological effect. Catastrophic outbreaks of weeds or insect pests are unlikely as a result of weather modification, but not impossible. Big game animals could be adversely affected if snow accumulation is significantly increased on winter range. Somewhat different effects are anticipated in semiarid and in humid regions. There does not appear to be an immediate serious threat of environmental contamination from silver iodide or other seeding agents. If a global environmental monitoring system is developed, it should deal with all forms of environmental change, not weather modification alone. No research dealing specifically with ecological effects of weather modification has yet been reported. Institutional arrangements may have to be altered to obtain research support in this area. The report includes sections of anticipated kinds of weather modification; effects in semiarid climates and in humid climates; pests and diseases; direct effects of seeding agents; biology of lakes and streams; fog, hail, lightning, and hurricane modification; environmental monitoring programs; inferences from ecological theory; recommended research; and recommended pre-modification field surveys.

Total water in rivers and ground is ample for future needs; regional shortages can be alleviated by some optimum combination of pollution control, water reprocessing and reuse, and groundwater development; water deficient regions can benefit by river diversion. However, whether pollution problems can be cured at this point is doubtful. Intervention of man in natural equilibria--physical, ecological, and hydrological--has created an entirely new hydrologic system which cannot reach its equilibrium while man continues to alter its parameters. The precise effects of these changes are not known because population requirements and varied wastes are so widespread that basic hydrologic data have become mere historical records. The lack of hydrologic data can result in critical problems as schemes, of continental proportions, for rerouting water from one drainage basin to another come under scrutiny. Water management studies are also seriously deficient since no method exists for assignment of meaningful numbers to esthetic and ethical uses. Stochastic models describing overall environmental behavior, electrical networks as analog models for groundwater systems, and simulation methods based on digital computer are trends in hydrology. The technical community should keep its ears attuned to river murmurs as well as to the whine of turbines. (Jones-Wisconsin)

W R WRAPE STAVE CO V ARKANSAS STATE GAME AND FISH COMM'N (CONDEMNATION FOR CONSERVATION OF WILDLIFE).

219 SW2d 948-953 (Ark 1949).

Descriptors: *Arkansas, *Wildlife conservation, *Eminent domain, *Fish conservation, Remedies, State governments, Condemnation, Reservoirs, Dams, Pipelines, Easements, Conservation, Fish, Wildlife, Judicial decisions, Legal aspects, Administrative agencies, Compensation.

The State Game and Fish Commission sought to condemn lands for the creation of a reservoir for a fish and game reserve. Defendant landowners opposed the condemnation alleging that it was not authorized for the purposes contemplated by the legislature and that the land was already devoted to a public use in that defendant's pipeline served the public. The defendants appealed from an adverse ruling in the chancery court. The supreme court affirmed this decision. It found that the Arkansas constitution granted the Fish and Game Commission broad discretion in determining how wildlife should be conserved and that it had not been established that the Commission went beyond this. The court agreed that land which had been devoted to a public use could not be subjected to subsequent condemnation which would impair its first use. However, here the pipeline could have been reasonably maintained under the reservoir or relocated at a cost not incompatible with the Com-

mission's objectives. The inconvenience and cost to the pipeline company, while it required compensation, was not sufficient to justify injunctive relief. (Gabrielson-Florida)

07. RESOURCES DATA

7B. Data Acquisition

THE MEASUREMENT OF HIGH DISCHARGES IN TURBULENT RIVERS USING TRITIUM TRACER,
International Atomic Energy Agency, Vienna (Austria); and Ministry of Natural Resources, Nairobi (Kenya). Dept. of Water Development.
T. Florkowski, T. G. Davis, B. Wallander, and D. R. L. Prabhakar.
J Hydrol, Vol 8, No 3, p 249-264, July 1969. 16 p, 5 fig, 2 tab, 11 ref.

Descriptors: *Flow measurement, *Tracers, Turbulent flow, Stream gages, Gaging stations, Tracking techniques, Radioisotopes, Tritium, On-site tests.
Identifiers: Isotope dilution flow measurement.

Use of tritiated water as a tracer for measurement of flow rate in turbulent rivers offers a promising technique for high flows where other methods are not feasible. Examples of application are given from flow gaging in River Tana where flows from 100 to over 500 cu m/sec have been measured and compared with rating curves. Tritium technique proved to be accurate, easy to use in remote areas and applicable for high flow rates. (Knapp-USGS)

Technion - Israel Inst. of Tech., Haifa. Hydraulic Lab.
M. H. Diskin.
J Hydrol, Vol 8, No 3, p 323-335, Jul 1969. 13 p, 5 fig, 2 tab, 2 ref, 1 append.

Descriptors: *Rainfall, *Runoff forecasting, *Probability, *Monte Carlo method, *Computer programs, Approximation method, Estimating, Rainfall disposition.
Identifiers: Thiessen polygon method.

A method of computation and a digital computer program for the determination of Thiessen weights of rainfall measuring stations is presented as a substitute to the graphical method commonly used for this purpose. The method is based on a Monte Carlo procedure for the estimation of the size of sub-areas of a rectangular area whereby the relative size of any sub-area is given by the limit as the number of points is increased of the ratio of random points falling inside the sub-area to the total number if such points generaged uniformly in the rectangular. An example of the use of the proposed method is also presented and the results obtained are discussed. (Knapp-USGS)

A RADIOGRAPHIC METHOD OF DETERMINING THE DIRECTION OF GROUND WATER FILTRATION IN DRILL HOLES,
Hydrogeological Enterprise, Warsaw (Poland).
Janusz Niemczynowicz, and Edward Fraczek.
Nukleonika, Vol 12, No 11, p 62-66, 1967. 5 p, 3 fig, 3 ref.

Descriptors: Groundwater, *Groundwater flow, *Groundwater movement, *Wells, Tracers, Radioisotopes, X-rays, *Boreholes, Water wells, *Drill holes, Filtration, Infiltration, Radiation measurement, *Radioactivity techniques, *Orientation, Direction finding.
Identifiers: Poland, Radiation detectors, *Radioactive tracers, Probes (Instruments), Foreign products, Gyro compasses, Radiography.

The radiometric single-hole method determines the direction of filtration in a drill hole by introducing a radioactive isotope into the water. The radioisotope is deposited by the flowing water on the filter and in the surrounding ground; absorption of the radioactive isotope is greatest in the direction of flow and least in the opposite direction. The center of greatest concentration is located with a directional radiation detector. The measuring instrument must be oriented to determine azimuths. A new probe has been developed for finding the direction of filtration. Radiation is detected on X-ray film; a gyroscopic direction indicator is used to orient the film. Using X-ray film has eliminated the need for intricate electronic equipment in the field. The gyroscopic direction indicator is suitable for measuring depths to 300 m. (USBR)

COLOR MIMICRY IN GEOLOGY AND GEOPHYSICS,
Geological Survey, Washington, D.C.
B. F. Grossling.
Geophys, Vol 34, No 2, p 249-254, Apr 1969. 6 p, 7 ref.

Descriptors: *Color, Data processing, Data reduction, Vision, Optical properties, *Optical instruments, Photographic equipment, *Photographs, Photography, Maps, *Aerial photography, *Geologic investigations, Geology, Geophysics.
Identifiers: *Data presentation, Optical analysis, Transparency, Optical measurements, *Photographic analysis, Visual aids.

Color mimicry is proposed as a method for revealing more information in a picture than is otherwise obtainable from an ordinary color or black and white photograph. The technique consists of preparing a color synthesis of 2 or 3 pictures of the same object or scene. Transparencies of the pictures are projected and superimposed on a screen, using a separate projector for each transparency. Various color effects are produced by using different combinations of white light and color filters in the projectors, adjusting the relative intensities of the projector lights, and deliberate misalinement of the projected images. The colors used in the mimicry need have nothing to do with any actual color sensation in the original data. The pictures may be taken from the visual or other bands of the electromagnetic spectrum, or even need not be photographs. Gray level representations of 2-dimensional fields of abstract data or data physically different than radiation can also be mimicked in color. (USBR)
W70-00332

THE DESIGN, CONSTRUCTION AND PERFORMANCE OF A VIBRATING-WIRE EARTH PRESSURE CELL,
H. S. H. Thomas, and W. H. Ward.
Bldg Res Sta Curr Pap, CP 14/69, May 1969. 15 p, 9 fig, 1 tab, 21 ref.

Descriptors: *Earth pressure, Effective stress, *Pressure gages, Earth dams, *Pressure measuring instruments, *Instrumentation, Soil mechanics, Calibrations, Foreign research, Hysteresis, Field tests, Bibliographies.
Identifiers: *Pressure cells, Arching, Arch action, Balderhead Dam (Gt Brit), Building Research Sta, DSIR, *Vibrating-wire strain gage.

Design and construction of a sturdy but accurate total earth pressure cell are described. Results from a group of cells buried in the clay core of an earthfill dam demonstrate the consistent performance and reliability of the cells over a 5-yr period. Modifying the cell permits a twofold use: measurement of soil pressure on a rigid surface and stress within a soil mass. The buried cell is 11 in. in diameter and 1-1/2 in. thick. The sensitive area on the cell face is 34% of the total area and the diameter/deflection ratio is slightly over 2000. When installed on a rigid surface, the cell is set in a ring of cold-setting rubber to prevent distortion by flexure of the structure. Models with maximum ranges of 100, 200, and 300 psi are being built. Vertical pressure readings during the last stages of construction of the dam are low compared to values obtained from an elastic solution. This is the result of the core arching between the shoulders. When the reservoir was filled, an increase in the ratio between the horizontal and the vertical effective stress and a rotation of the axes of principal stress were observed. (USBR)

08. ENGINEERING WORKS

8A. Structures

CHARACTERISTIC PRESSURE DISTRIBUTION IN OUTLET WORKS INLETS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Robert G. Cox, and Yen-Hsi Chu.
Corps Eng Rep No H-69-8, Sept 1969. 31 p, 17 ref.

Descriptors: *Hydraulic models, *Outlet works, *Hydraulic design, Model studies, Water structure, Flow resistance, Laboratory tests, Flow rates, Flood control.
Identifiers: *Pressure distribution, Upstream face geometry.

This report summarizes a study of inlet pressures measured in nine hydraulic models and two laboratory investigations of entrance designs for flood control outlet works. The experimental data are examined to determine the effects of upstream face geometry, guide piers, and bulkhead and gate slots. Both two-dimensional and three-dimensional flow inlets are considered and compared with free-streamline inlets. The results are presented graphically in terms of dimensionless pressure drop coefficients for use in estimating pressure conditions to be expected in design practice. Design criteria are recommended. (Lang-USGS)
W70-00002

RESUME OF THE REPORT ON THE FAILURES,
Central Electricity Generating Board, London (England). Generation Design Dept.
I. W. Hannah.
Natural Draught Cooling Towers - Ferrybridge and After, Proceedings of the Conference held at the Institution of Civil Engineers (June 12, 1967) p 1-7, 1967. 5 fig, 2 tab, 7 ref.

Descriptors: *Cooling tower, *Design criteria, *Structural design, Thermal powerplants.
Identifiers: *Ferrybridge Power Station.

The final report is summarized which the Committee of Inquiry produced in August 1966. Abstracts from the report are used wherever possible and the paper concludes with the full recommendations of the Committee, since it is probable that much of the design and development work on cooling towers to be undertaken in the next few years, will be guided by these recommendations. The main criticisms were: (a) use of a 1 min maximum mean wind speed for the design loading; (b) reinforcement proportioned without sufficient margins to cover uncertainties in wind loading and their dynamic effects; (c) sensitivity of design to minor changes in pressure coefficient distribution was not appreciated. Specification and design of the towers were discussed along with meteorological conditions, mode of failure, and research investigations. (Ross-Vanderbilt)
W70-00143

STRUCTURAL DESIGN PHILOSOPHY,
University Coll., London (England). Dept. of Civil Engineering.
A. H. Chilver.
Natural Draught Cooling Towers - Ferrybridge and After, Proceedings of the Conference held at the Institution of Civil Engineers (June 12, 1967) p 9-13, 1967. 3 fig, 7 ref.

Descriptors: *Cooling tower, *Wind pressure, *Structural design, Elastic theory.
Identifiers: Wind loading, Critical dynamic pressure, Ferrybridge cooling tower.

An attempt is made to show the difficulties in formulating a structural design philosophy for hyperboloidal cooling towers. The problem is complicated by the fact that the actual state of wind loading of a cooling tower is unsteady and random in nature. The unsteadiness appears to be accentuated in groups of towers. It is suggested that an acceptably low rate of structural failures, of the order of one group of towers, within 20 similar groups, once in 25 years, implies the design of towers to collapse at wind speeds of about 125 miles/hr. This probably corresponds to an elastic design wind speed of about 100 miles/hr. Some special problems of the structural design of hyperboloidal cooling towers are considered briefly, including the importance of shell-bending effects, buckling under wind loading and resonant vibrations. Reinforced concrete towers may become prone to static or dynamic instability because of extensive vertical cracking; it is suggested that some form of circumferential prestressing may be necessary to overcome the weakening effects of vertical cracks. (Ross-Vanderbilt)
W70-00144

CONSEQUENTIAL PROBLEMS ON OTHER CEGB STATIONS,
Central Electricity Generating Board, London (England).
W. A. Fitzherbert.
Natural Draught Cooling Towers - Ferrybridge and After, Proceedings of the Conference held at the Institution of Civil Engineers (June 12, 1967), p 45-49, 1967. 3 fig, 1 tab.

Descriptors: *Cooling tower, *Design standards, *Structural design.
Identifiers: *Ferrybridge power station, *CEGB stations, Meridional reinforcement in the shell, Notional tensile strength, Pressure coefficient specifications.

The Ferrybridge Report concluded that the basic cause of collapse of the completed cooling towers was due to errors in specification and design rather than to faulty construction and pointed out that these faults may well have been introduced at other contemporary stations. Subsequent analysis has confirmed this and the paper discusses the practical problems of introducing adequate factors of safety in these existing structures. Preliminary investigations revealed a pronounced weakness in the provision of meridional reinforcement in the shell. The collapsed shells were to be rebuilt with 8 inch walls having a similar total amount of reinforcement to that used in the strengthened shells, divided between the faces to increase local bending stiffness. THE ROUND TURBULENT JET IN A CROSS WIND,
Toronto Univ. (Ontario). Dept. of Mechanical Engineering.
J. F. Keffer, and W. D. Baines.
Journal of Fluid Mechanics, Vol 15, Part 4, p 481-496, Apr 1963. 13 fig, 12 ref.

Descriptors: *Winds, *Jets, *Model studies, Flow profiles, Turbulent flow.
Identifiers: *Entrainment, *Entrainment coefficient.

Model studies of the flow of a jet normal to a uniform, steady cross-wind were made in a low speed air tunnel. Velocity ratios (jet to ambient) were varied from 2 to 10. Experimental results show that for various jet strengths the position of the jet in space, when stretched by the ratio of jet to cross-wind momenta, is described by a single function. Exceptions exist at very low velocity ratios where a shift of the potential core is evident. A natural system of axes is used to define important directions of the flow. The integrated equation of motion along the primary jet flow direction is made dimensionless after the general method of Morton (1961) and a virtual source is defined by the flow. It is shown that a single functional behavior of the axial jet velocity ratios if the jet is considered to originate from this source. Lateral velocity profiles show a similarity when scaled by appropriate lengths and velocities but true self-preservation is not attained. (Guerrero-Vanderbilt)
W70-00154

HYPERBOLIC COOLING TOWERS,
Leslie (Robert) and Partners.
W. M. Stern.
Power, Vol 111, p 59-62, Feb 1967.

Descriptors: *Cooling towers, Structural design, Wind pressure.
Identifiers: *Hyperbolic cooling towers, *Economics of cooling towers, Exhaust effluent, Tower spacing, Wind-loading.

When constructing natural draft cooling towers, especially the immense hyperbolic towers, very severe structural requirements must be met. Layout of multiple towers, economics, climate and wind loading, height of exhaust, packing or fill arrangements to dimension the ultimate diameter of

the tower, or packless towers, spray equipment, availability of water and construction materials are all factors to be considered. Now commonly constructed are the hyperbolic concrete-shell cooling towers. Climbing scaffolds and slipforms are used in their construction. (Rietveld-Vanderbilt)

PHILOSOPHY OF FAILURE,
Imperial Coll. of Science and Technology, London (England). Dept. of Engineering.
A. L. L. Baker.
Natural Draught Cooling Towers - Ferrybridge and After, Proceedings of the Conference held at the Institution of Civil Engineers (June 12, 1967) p 15-17, 1967. 1 fig, 1 tab, 2 ref.

Descriptors: *Cooling towers, *Structural analysis, Concrete construction, Wind pressure.
Identifiers: *Ferrybridge cooling tower, Buckling resistance, Tower shells, Aerodynamic data.

The paper points to the large differences between the buckling resistance of cooling-tower shells and their ability to oppose uplift forces, and indicates the importance of increasing the latter. Preserving the shell structural stiffness by correct arrangement of the necessary additional reinforcement is also considered essential. From regarding the Ferrybridge collapse as a massive full-scale experiment, a design philosophy compatible with the European Concrete Committee limit state approach is outlined. The significance of the present lack of reliable aerodynamic data and the remarkable sensitivity of tower shells to variations in loading are clearly described. (Ross-Vanderbilt)
W70-00294

MATHEMATICAL ASPECTS,
National Physical Lab., Teddington (England).
E. L. Albasiny, and D. W. Martin.
Natural Draught Cooling Towers-Ferrybridge and After, proceedings of the conference held at the Institution of Civil Engineers (June 12, 1967), p 31-35, 1967. 6 fig, 3 ref.

Descriptors: *Cooling towers, *Mathematical studies, *Structural analysis, Wind pressure.
Identifiers: Bending solutions, Membrane solutions, Base distortion effects, Elastic equilibrium, Ferrybridge cooling tower.

Numerical solutions have been obtained to the complete linear equilibrium equations for a single hyperbolic cooling tower shell subjected to a steady wind loading. The Authors' published results for a typical tower show (a) that the bending solutions in the main body of the shell are unaffected by the additional support conditions assumed at the base; (b) that the bending and membrane solutions for the direct forces and displacements are in good agreement and (c) that maximum moment values occur near the throat of the tower, apart from possible edge effects, and vary roughly as the square of the shell thickness. The analysis is extended here by permitting tangential displacements at the base of the shell which are proportional to the net horizontal edge-force and to the vertical stress-resultant. It is demonstrated that the bending stresses can be substantially increased by these flexible support conditions, whereas the direct stress-resultants are relatively unaffected. It is further shown that the effect of a local subsidence at the base of the shell is to induce bending stresses. (Ross-Vanderbilt)

VIBRATION OF COOLING-TOWER SHELLS,
Central Electricity Generating Board, Leatherhead (England). Central Electricity Research Labs.
J. J. Williams.
Natural Draught Cooling Towers-Ferrybridge and After, proceedings of the conference held at the Institute of Civil Engineers (June 12, 1967), p 37-43, 1967. 14 fig, 11 ref.

Descriptors: *Cooling towers, *Wind pressure, *Model testing, *Vibrations.
Identifiers: Ferrybridge cooling towers, Hyperbolic cooling tower, Cone-toroid cooling tower, Dynamic stiffness, Natural frequencies.

Theoretical and experimental investigations of the frequency response of hyperbolic and cone-toroid cooling-tower shells have shown that the lowest natural frequencies are associated with a circumferential wave number of 4 or 5, and an axial wave number of 2 (in normal displacement). Comparison of the lowest natural frequencies of a cone-toroid and a corresponding hyperbolic shell shows that in general, the frequencies of the hyperboloid are significantly higher. This indicates that meridional curvature is a critical parameter governing the dynamic stiffness of cooling-tower shells. (Ross-Vanderbilt)
W70-00296

SOME AERODYNAMIC PROBLEMS OF GROUPED COOLING TOWERS,
Imperial Coll. of Science and Technology, London (England). Dept. of Aeronautics.
P. R. Owen.
Natural Draught Cooling Towers-Ferrybridge and After, proceedings of the conference held at the Institute of Civil Engineers (June 12, 1967) p 73-78, 1967. 4 fig, 2 tab, 7 ref.

Descriptors: *Cooling towers, *Wind pressure, Flow profiles.
Identifiers: Aerodynamic problems, Ferrybridge cooling tower, Wind shear.

Certain aerodynamic problems of grouped cooling towers are discussed: namely, the tendency of the group to slow-down the approaching wind and to ameliorate the so-called 'channelling effect'; and the possibility, revealed by experiment, of fluctuating forces being magnified in comparison with those on an isolated tower. Some remarks are made about the effect of wind shear on the pressure distribution over a tower and lead to the suggestion that, over the windward face of the tower, the distribution is comparable with that arising from a uniform wind whose velocity is approximately the same as that in the sheared wind at a distance from the ground equal to the height of the tower. STATUS OF BIG COOLING TOWERS,
Marley Co.
E. P. Hansen, and J. J. Parker.
Power Engineering, Vol 71, No 6, p 38-41, May 1967. 3 fig.

Descriptors: *Cooling towers.
Identifiers: *Cross-flow design, Louvers, Towerfill, Drift eliminators, Pressure preservative treatment, Joint connectors.

The article discusses the design and advance material usage of cross-flow design. Problem of icing, entry of debris and deterioration of wood material of towers have been averted by the design and arrangement of today's cross-flow cooling towers. Louvers are constantly flooded with warm water preventing a build up of ice. Asbestos-cement board or reinforced fiberglass is used to eliminate deterioration problems. In design of towerfill, grids of stable, inert material, such as reinforced fiberglass are used to support full splash bars which prevent sagging, and permit fill to expand and contract without warping or cracking. A good design of drift eliminator will operate efficiently with a static pressure drop of less than 0.04 in. (of water) at an airflow rate of 500 fpm and will limit water loss by drift to less than 0.2% of the volume of water being circulated. Fan cylinder is made of glass-reinforced polyester panels, which, when assembled form an ideal eased air inlet and an outlet which provides recovery of discharge air velocity. Single units of hyperbolic natural-draft towers can handle cooling water requirements for units up to 1000 MW. The first hyperbolic unit went on line in 1962 and currently 18 are either completed or contracted for in the United States. (Upadhyaya-Vanderbilt)

STEEL TUNNEL LINER PLATE ASSEMBLY, FABRICATION, TRANSPORTATION AND INSTALLATION IN THE ANGELES TUNNEL,
California State Dept. of Water Resources, Sacramento.
Leo H. Moir, Jr.
Tech Memo 41, Dep Water Resour, Calif, Jan 1969. 23 p, 18 fig, 2 tab.

Descriptors: *Tunnel linings, *Steel linings, Reinforcing, Stiffening, Fabrication, Handling equipment, Inspection, Transportation, Welding, Weight, Construction, Welded joints, X-ray inspection, Grinding, Installation, *Tunnel construction, Tunnels, California.
Identifiers: Tunnel supports, *California Aqueduct, Stiffeners.

The Angeles Tunnel on the west branch of the California Aqueduct requires reinforcement in places of faulting and minimum overburden. This reinforcement is provided by a circular steel tunnel liner 30 ft in diameter, fabricated underground from 30-ft-long sections known as Cans. Weight of these Cans, including the external stiffener ribs, varied from 53 to 116 tons, and required unusual engineering methods in fabrication, quality control, and placement. The location of the areas of tunnel reinforcement, specifications for the Cans, methods of assembly and fabrication, inspection procedures, transportation, and installation are described. Photographs of fabrication and installation are included. (USBR)

COMPOSITE ACTION BETWEEN BRICK PANEL WALLS AND THEIR SUPPORTING BEAMS,
City Univ., London (England).
P. Burhouse.
Inst Civ Eng Proc, Vol 43, p 175-194, June 1969. 20 p, 18 fig, 12 tab, 4 ref.

Descriptors: Structural design, *Structural behavior, *Bricks, Foreign research, Test procedures, *Beams (Structural), Loads (Forces), Stress, *Testing, Failures, Reinforced concrete, Deflection, Compression, Youngs modulus, Bending moments, Composite structures, Shear forces, *Walls, Compressive strength.
Identifiers: *Brick masonry, *Loading tests, *Destructive tests, Test results, Foreign testing, Great Britain.

Results are given of experimental work in which simply supported beams carrying brick walls were tested to failure, the load being applied at the top of the wall. The height-to-span ratio of the panel walls was varied and the supporting beams were either of reinforced concrete or cased structural steel joists. Experimental results are compared with results obtained from an analytical treatment of composite walls. Because of the concentration of stress that occurs in the masonry, permissible loads on walls acting in conjunction with their supporting beams should be less than loads specified in the British Standard Code of Practice (CP 111) giving the allowable working load on a brick wall. With a low height-to-span ratio of the wall, composite action may break down because of sliding at the wall-beam interface. (USBR)

THE SLIDING STABILITY OF DAMS,
Harald Link.
Water Power, Vol 21, No 3, 4, 5, p 99-103, 135-139, 172-179, Mar/Apr/May 1969. 18 p, 20 fig, 3 tab, 34 ref.

Descriptors: *Dams, *Shear resistance, *Shear tests, Foundation investigations, Dam design, Dam foundations, Rock mechanics, Deformation, Stability, Hydraulic structures, Core drilling, Concrete technology, Foreign design practices, Safety, Safety factors, Dam failure, Strain gages, Bibliographies, Gravity dams, Buttress dams.
Identifiers: *Sliding resistance, *In situ tests, Great Britain, Test results, Dam stability, Horizontal displacements.

Ensuring the permanent stability of a dam economically requires knowledge of all aspects of the natural characteristics of the underlying foundation area. Slide-proof construction is the foremost requirement, demanding precise knowledge of and sure judgment in subsoil conditions. Dam failures in the past stemmed all too often from lack of shearing or sliding resistance at the base. Review of international literature of the past 25 yr confirms a certain lack of precision in judging sliding stability, but worldwide gains in the knowledge of investigating site conditions in depth, using rock mechanics, have given much valuable experience in the past 10 yr. Present practices for various countries are discussed, with emphasis on shear resistance testing of rock masses at and below the base of a dam. The safety of existing dams can be monitored by careful study of deformation characteristics, recognizing early danger signals. Such measurements should be incorporated into the operational routine, at least during high-water periods. (USBR)

APPLICATION OF SHOTCRETE IN TUNNEL NO 1 AND TUNNEL NO 3,
California State Dept. of Water Resources, Sacramento.
Samuel S. Dulberg.
Tech Memo No 35, Dep Water Resour, Calif, Nov 1968. 30 p, 9 photo, 2 dwg.

Descriptors: Tunneling, *Tunnel linings, *Tunnel construction, Faults (Geology), Tunnels, *Gunite, Applizcation methods, Accelerators, Lagging, Concretes, Hardening, Rock bolts, Additives.
Identifiers: *Tunnel supports, Tehachapi-West Branch Proj, Calif.

Shotcrete is a modified, pneumatically applied mortar containing aggregates up to 3/4 in. in size and an accelerator that produces appreciable hardening within 15 min of application and structural strength within hours. Shotcrete was used as the primary support system for approximately 2400 linear ft of Tunnel No 1, and as supplementary support for approximately 900 linear ft of Tunnel No 3 of the Tehachapi-West Branch Project in California. This is the first time that shotcrete has been used as tunnel support in the State of California, and probably the first time in the United States. Shotcrete has been used successfully in Europe since 1957 for tunnel support in bad ground, with and without steel supports and rock bolts. Several problems experienced by the California contractor, including resistance from the miners because of unfamiliarity with this type of tunnel support, are discussed. The method is described and evaluated. Shotcreting can improve the art of tunneling by providing a less expensive and better support system. (USBR)

A HYDRAULIC MODEL STUDY OF LANDSLIDE-GENERATED WATER WAVES IN BAYS,
California Univ., Berkeley. Hydraulic Engineering Lab.
Edward M. Kuba.
Shore and Beach, Vol 37, No 1, p 49-54, Apr 1969. 6 p, 6 fig, 11 ref.

Descriptors: *Waves (Water), *Landslides, *Model studies, *Hydraulic models, Seiches, Surges, Bays, Estuaries, Lakes, Reservoirs, Floods, Erosion.
Identifiers: Landslide-generated water waves.

A hydraulic model was constructed to study waves generated in bays, estuaries, and reservoirs by landslides. These waves may be hundreds of feet high and cause great loss of life and property, as at the Vaiont Dam, Italy, in 1963. The model is 1 ft wide, 3 ft deep, and 105 ft long. Waves are generated by sliding a block down an incline into the water at a measured speed. Wave height may be predicted when water depth, the horizontal landslide velocity component, and the horizontal component of landslide movement are known. (Knapp-USGS)

EFFECTS OF WATER TEMPERATURE ON BED-LOAD MOVEMENT,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
John J. Franco.
Journal of the Waterways and Harbors Division, Proceedings of the American Society of Civil Engineers, Vol 94, p 343-352, Aug 1968. 8 fig, 1 tab, 5 ref.

Descriptors: *Sediment transport, *Water temperature, *Water flow, Stream bed, Bed load.
Identifiers: *Bed movement, Flume study.

Laboratory investigations have indicated that the effects of water temperature on the movement of sediment and on flow in alluvial streams can be appreciable. Some variations noted in flow conditions in the field can be attributed to the effects of water temperature. Information available on the subject has been confusing, or too general to permit the development of definite relations. An investigation undertaken to determine the effects of changes in water temperature on sediment transport, streambed forms, and bed roughness for various types of material is described. The effects of water temperature on bed-load appear to be mostly in the formation of the bed and the bed roughness. (Ross-Vanderbilt)
W70-00142

EFFECTS OF WATER TEMPERATURE ON THE DISCHARGE OF BED MATERIAL,
Department of the Interior, Washington, D.C.
B. R. Colby, and C. H. Scott.
Available from the Superintendent of Document, US Gov't. Printing Office, Washington, D.C., 20402, for $0.25 per copy. Geological Survey Professional Paper 462-G, 25 p, Washington, D.C., 1965. 18 fig, 1 tab, 27 ref.

Descriptors: *Water temperature, *Viscosity, Sediment transport, Alluvial channels, Suspended sediment, Fall velocity, Heated water.
Identifiers: *Temperature effects, Flume flows, Field streams, Laminar sublayer, Viscosity changes, Bed material discharge.

Changes in water temperature and consequent changes in viscosity affect bed-material discharge in complex ways. These ways may be explained in three separate effects. One effect is on the thickness of the laminar sublayer, and this effect is usually the smallest of the three. A second effect is on the vertical distribution of suspended bed material. The third effect is on the bed configuration and, hence, on the resistance to flow. Experimentally defined temperature effects on bed-material discharge usually require classification in terms of the flow characteristics that were kept constant, the variables that were involved in the analysis of the data, and the way in which the data was analyzed. Experimental defined temperature effects on the relation of bed-material discharge to mean velocity for three rivers indicate an average percentage increase of about 75 in bed-material discharge for a decrease of water temperature from 80 deg. to 40 deg. F. High concentrations of fine sediment increase the apparent viscosity of a water-sediment mixture. The addition of 20,000 parts per million of bentonite to distilled water has an effect on viscosity that is about the same as the effect on distilled water of a reduction in water temperature from 60 deg. to 34 deg. F. (Ross-Vanderbilt)
W70-00152

DISPERSIVITY TENSOR FOR TURBULENT UNIFORM CHANNEL FLOW,
Hydronautics, Inc., Laurel, Md.
Gedeon Dagan.
ASCE Proc, J Hydraul Div, Vol 95, No HY5, Pap 6794, p 1699-1712, Sept 1969. 14 p, 3 fig, 20 ref, append. OWRR Project C-1008.

Descriptors: *Dispersion, *Mathematical studies, Reynolds number, Mixing, Streamflow, Diffusivity, Diffusion, Silts, Turbulent flow, Thermal pollution, Waste dilution.
Identifiers: Dispersivity tensor.

The turbulent mixing of a solute in a streamflow is described with the aid of the dispersivity tensor. In a 2-dimensional pipe or wide channel flow only the radial, or vertical, dispersivity coefficient is significant and is usually determined through the Reynolds analogy. The analogy is extended to a 3-dimensional (i.e., channel of arbitrary section) uniform flow. It is shown that the mixing length theory leads to the representation of the dispersivity tensor in the terms of only 2 distinct coefficients: (1) A coefficient representing mixing normal to isovels which may be found through Reynolds analogy; and (2) a lateral dispersivity coefficient which has to be determined from dispersivity measurements. INSTABILITY OF FLAT BED IN ALLUVIAL CHANNELS,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
Harry M. Hill, Vajapeyan S. Srinivasan, and Tharakkal E. Unny, Jr.
Invest supported by research grant from Nat Res Council of Canada. ASCE Proc, J Hydraul Div, Vol 95, No HY5, Pap 6770, p 1545-1558, Sept 1969. 14 p, 5 fig, 3 tab, 25 ref, append.

Descriptors: *Open channel flow, *Alluvial channels, *Channel morphology, *Dunes, *Ripple marks, Bed load, Sediment transport, Hydraulics, Steady flow, Turbulent flow, Scour, Regime.
Identifiers: Alluvial channel stability.

The occurrence of different bed forms has been considered as an instability in the flat bed flow. A general functional relationship was developed for the instability of flat bed when it is replaced by either dunes or ripples. Two distinct relationships exist for the two instabilities. A region of transition exists in between the two functions where either instability may occur. The stability function is useful to predict the occurrence of different bed forms. (Knapp-USGS)
W70-00217

FLOOD WAVE MODIFICATION ALONG PRISMATIC CHANNELS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Giampaolo Di Silvio.
ASCE Proc, J Hydraul Div, Vol 95, No HY5, Pap 6777, p 1589-1614, Sept 1969. 26 p, 9 fig, 2 tab, 25 ref, 3 append.

Descriptors: *Floods, *Waves (Water), *Flood routing, Hydrographs, Flood forecasting, Mathematical models, Open channels, Open channel flow, Unsteady flow, Hydraulics.
Identifiers: Flood wave attenuation.

The general behavior of a flood wave propagating along a prismatic channel is examined. Attenuation is not always to be expected, and a criterion for discriminating attenuation and amplification of flood waves is stated, quite similar to the analogous criterion for infinitesimal perturbations. An approximate procedure for flood waves that are approximately fitted by a triangular shape is developed; a set of nondimensional graphs may be used to predict the modification with respect to time of a triangular wave in dependence of two parameters called 'attenuation' and 'distortion-coefficient.' A simple formula is suggested to calculate peak attenuation or amplification, which does not depend on the distortion coefficient. Comparisons with experimental tests seem to be quite satisfactory. Some auxiliary elements are given for facilitating computations in part-full circular pipes. (Knapp-USGS)

Richard R. Brock.
ASCE Proc, J Hydraul Div, Vol 95, No HY4, Pap 6704, p 1401-1427, July 1969. 27 p, 16 fig, 5 tab, 12 ref, 3 append.

Descriptors: *Open channel flow, *Unsteady flow, *Waves (Water), *Hydraulics, *Supercritical flow, Turbulent flow, Model studies, Hydraulic models, Open channels.
Identifiers: Roll waves.

The maximum depth at wave crest, minimum depth at wave trough, wave period and wave velocity of spontaneously developed roll-wave trains were measured in a laboratory channel. Channel slope was varied from 0.05 to 12, normal depth was varied by a factor of 2, and the Froude number of the undisturbed flow (F) ranged from 3.5 to 5.6. For each of the 4 properties, a single development curve resulted for all depths with slope and F fixed. The spatial rate of growth of the average maximum depth increased as F was increased by increasing slope. The growth rate decreased as slope was increased and F was held fixed. Substantial growth occurs when one wave overtakes and combines with another wave. Growth also occurs without wave overtaking. Spontaneously developed roll waves are shown to be related to periodic permanent roll waves. Methods of applying the laboratory results to other channels with inlet conditions similar to that of the laboratory channel are presented. (Knapp-USGS)

FLOW RETARDANCE IN VEGETATED CHANNELS,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
Nicholas Kouwen, T. E. Unny, and Harry M. Hill.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR2, Pap 6633, p 329-342, June 1969. 14 p, 7 fig, 2 tab, 21 ref, append.

Descriptors: *Open channel flow, *Vegetation effects, *Roughness (Hydraulic), *Retardance, Streamflow, Model studies, Hydraulic models, Laboratory tests, Flow resistance, Fluid friction, Mannings equation, Roughness coefficient.
Identifiers: Flow retardance.

A quasi-theoretical analysis is given for the flow retardance in vegetated channels. Based on this, a logarithmic flow formula is derived for flow in these channels. The analysis is illustrated with flow data obtained from channels in which natural vegetation was present and from a laboratory flume having flexible artificial roughness elements fixed to the bottom. W70-00228

SPREAD OF BUOYANT JETS AT THE FREE SURFACE,
University of Strathclyde, Glasgow (Scotland). Dept. of Civil ENGINEERING.
James J. Sharp.
ASCE Proc, J Hydraul Div, Vol 95, No HY3, Pap 6538, p 811-825, May 1969. 15 p, 4 fig, 1 tab, 20 ref, append.

Descriptors: *Dispersion, *Jets, Open channel flow, Mixing, Model studies, Hydraulic models, Nozzles, Orifices, Stratified flow, Hydraulics, Waste dilution.
Identifiers: Jet spreading, Bouyant jets.

A study is made of the surface spread which occurs when a jet of fluid is discharged at depth into a fluid of greater density. The method of synthesis is used to relate the rate of spread to the conditions at the point where the jet plus entrained fluid flow reaches the free surface. It is explained how these conditions can be related to the initial conditions at the nozzle by means of dilution diagrams. Experiments are described, which confirm the correlation obtained and also provide the basis of a working diagram for rate of spread. The shape of the curves of this spread diagram are explained and it is shown how the curves can safely be extrapolated, in one direction, into the working prototype range. The spread diagram can be used as a means of predicting spread and as a design diagram for choosing scales for hydraulic models. The method for choosing scales is outlined by an illustrative example and the difficulties of incorporating a nozzle in the model to reproduce a prototype spread are emphasized. (Knapp-USGS)

PROFILES OF THE ROUND TURBULENT JET IN A CROSS FLOW,
Toronto Univ. (Ontario).
Bruce D. Prette, and W. Douglas Baines.
Journal of the Hydraulics Division, ASCE, Vol 93, No HY6, Proc Paper SS56, p 53-64, Nov, 1967. 9 fig, 5 ref.

Descriptors: *Turbulence, *Jets, Turbulent flow, Models, Flow.

The shape of a jet issuing normal to a uniform cross wind has been studied experimentally for a large range of jet to wind velocity ratio, R, and over a large distance downstream of the source. A situation with only dynamic effects and a jet to wind velocity ratio more than one (R> 1) is studied. Photographs taken of an oil aerosol jet were used to determine the size and position of the jet; and mean velocity measurements were made close to the outlet. Dimensional analysis shows that for negligible viscous stresses the jet profile and cross section size are functions only of R. A momentum flux equation combined with experimental observation leads to a single form for the profile, with all linear dimensions divided by R. Experimental measurements also show that the shape follows the same parameter, and indicate zones of the jet in which the translational and vortex motions dominate. Consequences of the form of the results are discussed. (Guerrero-Vanderbilt)

HORIZONTAL TWO-DIMENSIONAL DENSITY CURRENT,
New South Wales Univ., Kensington (Australia).
I. R. Wood.
Journal of the Hydraulic Division, ASCE, Vol 93, No HY2, Proc Paper 5139, p 35-42, Mar, 1967. 5 fig, 2 ref.

Descriptors: *Density currents, *Flow, Hydraulic jump, Froude number.
Identifiers: *Entrainment.

The flow in the region of entrainment for a two dimensional horizontal density current was examined and was compared with that of the hydraulic jump. It has been shown that the depth of flow in the region where entrainment has dropped to negligible proportions is uniform and is dependent on the inflowing densimetric Froude number. The data are presented giving the upstream and downstream depths of flow and the shape of the region of entrainment as a function of the inlet densimetric Froude number. Conclusions were: (1) The similarity of entraining and free surface hydraulic jump; (2) The marked effect of the inflowing Froude number on the constant c, which relates inlet Froude number to downstream depth of the density current. SYNTHETIC TESTING USING CAPACITIVE CURRENT VOLTAGE SOURCES,
Sydney Univ. (Australia).
H. K. Messerle, and D. K. Sweeting.
Inst Eng, Aust, Elec Eng Trans, Vol EE4, No 2, p 179-188, Sept 1968. 10 p, 15 fig, 17 ref.

Descriptors: *Circuit breakers, *Test facilities, *Test procedures, Initial costs, Operating costs, Flexibility, Reliability, Costs, Electric currents, Electric potential, Electrical equipment, Foreign research, Capacitors, Bibliographies.
Identifiers: *Synthetic test methods, Testing equipment, Test results, Foreign testing, Australia, Cost savings, Waveforms.

For reasons of economy and flexibility, synthetic testing of circuit breakers having large breaking capacity is being introduced in place of conventional full-power testing methods. Principal features of synthetic testing of circuit breakers are discussed. Simple and inexpensive capacitive energy storage banks used to set up a synthetic test station for general purpose testing are described. Advantages of a synthetic testing station using capacitive power supplies for the current and voltage sources are given. Using capacitors not only simplifies operation of the test station and reduces operating costs, but also reduces initial cost compared to that for a more conventional test facility. This method simulates field conditions more closely and provides more flexibility than some other testing methods. (USBR)

SINGLE-PHASE BRIDGE CONVERTER WITH A NEW CONTROL AND A CORRESPONDING THREE-PHASE CONVERTER--I. OPERATIONAL FEATURES: II. METHODS OF CONTROL,
Bonneville Power Administration, Portland, Oreg; and General Electric Co, Schenectady, N.Y.
Narain G. Hingorani, and Philip Chadwick.
Direct Curr, Vol 1, No 1, p 25-35, Apr 1969. 11 p, 16 fig, 10 ref.

Descriptors: *Converters (Electrical), Direct current, Alternating current, Electrical design, Control, Foreign research, Electric potential, *Control systems, Electrical equipment, *Electric currents, Rectifiers, Inverters.
Identifiers: Great Britain, Harmonics, *Electric converter valves, Thyristors.

A fully-controlled, single-phase bridge circuit and a corresponding 3-phase version consisting of 3 single-phase bridge circuits in series are evaluated. Using the new control for the single-phase circuit, one valve pair connected to one of the d-c poles may be fired at a different angle of delay than the other valve pair. Angle of delay of one pair is changed until the limit is reached when the angle of delay of the other pair is changed for further control. This mode of operation provides substantial advantage over the converter with conventional control. Part I of the paper describes the operation of the single-phase bridge and the 3-phase series circuit using the new control and discusses various operational features. Part II presents a practical control scheme to obtain the desired control. (USBR)

LIGHTNING SURGES ON DC CABLES CONNECTED TO OVERHEAD LINES,
Royal Inst. of Tech., Stockholm (Sweden).
Sune Rusck
Direct Curr, Vol 1, No 1, p 41-44, Apr 1969. 4 p, 2 tab.

Descriptors: *Direct current, *Electric cables, *Lightning, *Surges, Electric insulation, Transmission lines, Attenuation, Damping, Time, Calculations, Reflection, Foreign research.
Identifiers: *Lightning surges, Overvoltage, Flashover, Traveling waves, Protection (Electrical), Spark gaps, Sweden.

Lightning surges to which an hvdc cable may be subjected when connected to overhead lines were investigated. Factors determining the magnitude of the voltage are the insulation level of the overhead line, the service voltage, the length of the line-end protection, the time to half-value of the lightning current and the cable attenuation; the magnitude of the lightning current has less influence. The largest surges are obtained on cables having a length less than 90 km at the end of the cable lying farthest away from the point of impact of the lightning stroke, and increase with decreasing cable length. If the cable is more than 30 km long and the basic insulation level of the overhead line is less than 4 times the service voltage, a line-end protection of a few km limits the surge to less than twice the service voltage. A sample calculation shows the effect of various parameters on the magnitude of surges. (USBR)

A STUDY ON DANCING OF OVERHEAD LINE BUNDLED CONDUCTORS,
Kansai Electric Power Co. Ltd., Osaka (Japan); AND Sumitomo Electric Industries Ltd., Osaka (Japan).
Yoshio Shichiri, Matsujiro Yamasaki, and Kazuhiko Okada.
Sumitomo Elec Tech Rev, No 12, p 10-16, Mar 1969. 7 p, 11 fig, 3 tab, 8 ref, append.

Descriptors: *Transmission lines, *Bundled conductors, Wind tunnels, Wind velocity, Test facilities, Test procedures, Drag, Lift, Winds, Vibrations, Foreign research, Wind pressure, Oscillation, *Conductors, *Electric cables.
Identifiers: *Galloping conductors, Test results, Japan, Testing equipment, *Aerodynamic forces.

The dancing (galloping) phenomenon of overhead line conductors caused by low-frequency, large-amplitude oscillations may result in electrical faults and mechanical damage to conductors. The occurrence is usually associated with the formation of ice on conductors, and is apt to increase with the increasing adoption of bundled conductors for overhead transmission lines. Wind tunnel tests were conducted on such aspects as: (1) comparison in aerodynamic force (drag and lift) characteristics between single and bundled conductors; and (2) effect of the twisting movement of bundled conductors on drag and lift force characteristics, particularly emphasizing an analysis of lift force characteristics, data for which have been scarce but closely connected with abnormal oscillation. Results of the wind tunnel tests on twin bundled conductors are described. (USBR)

SELECTION AND PERFORMANCE OF ANCHORS FOR GUYED TRANSMISSION TOWERS,
International Power and Engineering Consultants Ltd., Vancouver (British Columbia).
K. E. Robinson, and H. Taylor.
Can Geotech J Vol 6, No 2, p 119-137, May 1969. 19 p, 8 fig, 3 tab, 1 ref, disc.

Descriptors: *Anchors, *Anchored towers, Foreign construction, Foreign design practices, Transmission lines, *Transmission towers, Field tests, Backfill, *Guyed towers, Cast-in-place structures, Grouting, Economics, Soil investigations, Cost comparisons, Foundations.
Identifiers: Anchor plates, Anchor cables, Grillage rootings, Pull-out tests.

Designing anchors for guyed transmission line towers crossing difficult terrain involves construction considerations and theoretical soil mechanics. Two lines each over 540 mi long were built in British Columbia. Five anchors that were tested are: (1) buried plate with compacted backfill, (2) buried steel mat or grillage with loose backfill, (3) cast-in-place concrete with loose backfill, (4) power installed helical, and (5) grouted rod. The highly variable soil and access conditions along the line necessitated an anchor that could be installed economically in nearly all soil types and by ordinary construction equipment that could easily move between tower sites in rugged terrain. The simply installed, conservatively designed, cast-in-place concrete anchor satisfied these requirements at reasonable cost. Power-installed helical anchors and grouted rod anchors may provide an economical anchor in more uniform soil conditions where easier access exists, but require more detailed soil exploration and contract inspection than the cast-in-place concrete anchors. TECHNIQUES AND EQUIPMENT NEEDED FOR HVDC STUDIES,
Ebasco Services, Inc., New York.
A. W. Peabody.
Mater Prot, Vol 8, No 7, p 37-42, July, 1969. 6 p, 13 fig, 7 ref.

Descriptors: *Extra high voltage, *Direct current, Test procedures, *Corrosion, Transmission (Electrical), Corrosion control, Transmission lines, Instrumentation, Electric currents, Pipelines, Underground structure, Protective coatings, Electrical groundings, Electric potential.
Identifiers: *Stray current corrosion, *Ground currents, *Corrosion tests, *Ground return, Earth resistivity (Elect), Potential gradients.

High-voltage, Direct-current (hvdc) transmission systems are expected to be operational in the United States by early 1970. The unique stray current corrosion control problems associated with hvdc transmission involve testing techniques and instrumentation different from those in other types

of corrosion control testing. The importance of corrosion testing with respect to hvdc systems as well as procedures for determining potential gradient patterns and the location of maximum current discharge are discussed. Procedures used to measure current flow on structures are structure-to-earth potentials are described; measurement problems and instrumentation required are outlined. As hvdc systems become operational and experience is accumulated, a cooperative effort will be required to evaluate stray current effects on underground metallic structures and to develop measures of controlling the corrosive action of stray currents. EARTHWORK QUANTITIES BY RANDOM SAMPLING,
Construction Estimating, Inc.; and Gates-Scarpa and Associates, Inc., West Hartford, Conn.
Marvin Gates, and Amerigo Scarpa.
Proc Amer Soc Civ Eng, J Constr Div, Vol 95, No CO1, p 65-83, July 1969. 19 p, 4 fig, 4 tab, 1 ref, 2 append.

Descriptors: *Earthworks, Statistics, Construction, Estimating, Fills, Statistical analysis, *Sampling, Errors, Excavation, Embankments, Cuts, *Computation, *Calculations, *Measurement.
Identifiers: *Random sampling.

Statistical methods are applied to determine earthwork quantities. First, cut and fill areas are delineated and planimetered. Then a table of random numbers is used to locate sample items of depths of earthwork. The volume of earthwork is the product of the planimetered area and the weighted average of the sampled depths. The precision (error) of the answer is expressed as a function of confidence limit, average depth, contour interval, and number of sample items. The method is rapid, accurate, and yields the most meaningful results when compared with any other method used for computing earthwork quantities. The distribution of cut and fill areas can also be determined from the sample items used to find the depth of earthwork, a second source of error. Errors are quantified. (USBR)

FOUNDATION ANCHOR PILES IN CLAY-SHALES,
Prairie Farm Rehabilitation Administration (Saskatchewan).
J. L. Jaspar, and V. W. Shtenko.
Can Geotech J, Vol 6, No 2, p 159-175 May 1969. 17 p, 13 fig, 2 tab, 1 ref.

Descriptors: *Anchors, *Piles (Foundations), Pile spacing, Slabs, Clay shales, *Pile foundations, Shales, Spillways, Foundations, Field tests, *Expansive clays, *Expansive soils, Expansive forces, Swelling, Rebound, Foreign research, Foreign design practices, Differential displacements.
Identifiers: Pile tests, *Bearpaw shale, Swelling pressures, Canada, Belled anchors.

A test program was conducted at Gardiner Dam on the South Saskatchewan River Project, Canada, to obtain data on the design and performance of anchor piles installed in the Bearpaw shale formation. The formation is hard, is relatively undisturbed, contains joints or fissures in some places, has a water content less than 27%, and has a wet density greater than 120 pcf. The test area excavation was approximately 50 ft deep. Four test series were conducted, including quick loading by hydraulic jacks, long-term loading from swelling, and both of these types of loadings on piles with and without bells. The recommended design includes depth of anchoring, pile spacing, and size of anchor rod for various bell sizes. The design provides for some stretching without failure due to load applied through swelling of the shale. This will not eliminate swelling, but will reduce the rate and amount of swelling or differential movement. (USBR)

FOUNDATION FAILURES OF FOUR ROCKFILL SLOPES,
Council for Scientific and Industrial Research, Pretoria (South Africa).
Geoffrey E. Blight.
Proc ASCE, J Soil Mech Found Div, Vol 95, No SM3, p 743-767, May 1969. 25 p, 16 fig, 5 tab, 21 ref, append.

Descriptors: Clays, Fissures (Geology), Laboratory tests, *Rock fills, Overconsolidation, Shear tests, Shear, *Shear failures, Shear planes, *Shear strength, Vane shear tests, Slopes, Slope stability, *Foundation failure, Joints (Geology), Failures, Model tests, Waste dumps, Stability analysis, Soil mechanics, Quartzite, Bibliographies, Foundations.
Identifiers: In situ tests, Failure surfaces.

Failures of rockfill slopes were interpreted as large-scale shear tests on the foundation strata of stiff fissured clay. Analyses of the slope failures, together with in situ and laboratory shear tests on the clay, provided information on the relation between the strength in bulk of a stiff fissured clay and that measured by small-scale tests. Two failures were progressive and 2 were nonprogressive. For the nonprogressive failures and one progressive failure, strength in bulk was approximately equal to strength measured in small-scale field and laboratory tests. Strength in bulk found from the remaining progressive slide was less than strengths measured in small-scale tests. At all 4 sites in situ, effective horizontal stresses in the clay strata were about equal to the passive pressure resistance of the clay. This fact was used to provide an alternative assessment of bulk strength of the clay. (USBR)

A NEW METHOD OF DETECTING AND SEALING LEAKS IN WATER RESERVOIRS,
Pierre Patin.
Transl from Fr, Bur Reclam Transl 814, July 1969. 44 p, 17 fig, disc. Ann Inst Tech Batiment Trav Publics, Vol 22, No 253, p 1-20, Jan 1969.

Descriptors: *Reservoir leakage, *Reservoirs, Lakes, Karst, Lightweight aggregates, *Sealants, Permeability, Density, Materials, Fibers, *Settling velocity, *Leakage, Filters, Seals (Stoppers), Suspended solids, Plastics, Seepage, Bituminous materials, *Reservoir surveys, Foreign research, Reservoir operation, Groundwater flow.
Identifiers: Sealing layers, Foreign testing, France, Greece, Asphalt emulsions, Lake Yliki (Greece), Lightweight concretes

Leaks in reservoirs may be detected by placing a specially constructed long-bristle mop in the water and observing the orientation of the bristles. Another method is to systematically dispense colored bristles into the water and record movement of the fiber by aerial photography or underwater divers. The method for sealing leaks consists of selecting various-sized solid materials having a density approximately equal to water, suspending them in water, and relying on water current flowing through the leak to deposit them. A natural barrier is built up by successively depositing fiber-size materials. The required density of the materials, settling velocity, and preparation of suitable materials for large- and small-size particles are discussed. Materials for large-size particles include pumice and cellular concrete. Density is controlled by coating the particles with asphalt emulsion. A mixture of plastic fibers is used as smaller-sized material. Final sealing is accomplished by depositing rubber emulsion or bituminous filaments. Field studies are described for detecting and sealing leaks at Lake Yliki in Greece. (USBR)
W70-00322

PERMEABILITY DISTRIBUTION IN ARCH DAM FOUNDATIONS AS A FUNCTION OF THE STRESS FIELD,
Pierre Londe, and Francis Sabarly.
Comptes-rendus, Premier Congres Soc Int Mec Roches, Lisbonne, Vol 2, p 517-521, 1966. 21 Transl from Fr, Bur Reclam Transl 815, July 1969. 13 p, 7 fig, 1 tab.

Descriptors: *Permeability, *Rock mechanics, *Rocks, Laboratory tests, *Rock foundations, Arch dams, Fissures (Geology), Grouting, Percolation, Drainage, Drains, *Compression, Stress, Watertight, Engineering geology, *Dam foundations.
Identifiers: In situ rock, In situ tests, Rock pressures, Permeability coefficients, Permeability tests, Compression tests, Radial diffusion.

Laboratory tests show that the permeability of small specimens of fissured rock varies with the compressive stress applied. This property can be extended to the scale of rock masses. Simplified computations, borne out by in situ tests, establish that fissures in most rock masses are very narrow, and that their width and the permeability of the mass are very responsive to variations in compressive stress. These findings point to the probability of a watertight barrier being formed in the foundation rock in the direction of the forces exerted by an arch dam, and to the consequences of this factor on the design of the grouting and drainage systems. Reducing the amount of grouting should be possible, which for the most part is not only expensive but useless. Systematizing drainage should be possible also, making it a fundamental and economical element in the stability of foundations. (USBR)

FOUNDATION TESTING FOR AUBURN DAM,
Bureau of Reclamation, Denver, Colo.
George B. Wallace, Edward J. Slebir, and Fred A. Anderson.
Pap, 11th Symp Rock Mech, Univ Calif, Berkeley, June 1969. 86 p, 31 fig, 2 tab, 12 ref.

Descriptors: Arch dams, Concrete dams, *Rock properties, Schists, *Dam foundations, Field investigations, *Foundation rocks, Foundations, *Foundation investigations, Stress relieving, Foundation bearing tests, Rock mechanics, Abutments, Discontinuities, Field tests, Shear tests, Engineering geology.
Identifiers: Rock competency, Auburn Dam (Calif), *In situ tests, Radial jacking tests, Sliding tests, Plate bearing tests, *Rock testing.

Auburn Dam will be a thin, double-curvature concrete arch dam 685 ft high with a crest length of 4000 ft. The foundation rock consists of a steeply inclined sequence of foliated metamorphic rock, chiefly amphibolite with minor talc and chlorite schists and serpentine. Both abutments and the channel section contain faults, shear zones, and joints. Geologic mapping of the various rock types and discontinuities, along with design considerations, is providing a basis for the foundation testing program. The program includes uniaxial and radial jacking tests to obtain load vs time deformation relationships, shear and block sliding tests for cohesion and friction factors, plate bearing test to evaluate compressibility of fault gouge, and stress relief tests to determine stress magnitude and direction in the rock mass. Test methods are described and field testing is discussed. Laboratory tests of NX core are performed concurrently to determine physical and petrographic properties. (USBR)

THE RIGHT APPROACH TO EARTHQUAKE PREDICTION,
B. A. Petrushevskiy.
Phys Solid Earth, No 10, p 648-652, Oct 1968. 5 p, 5 ref.

Descriptors: *Earthquakes, Hazards, *Seismology, Geophysics, Economic impact, Seismic investigations, Geologic investigations, Psychological aspects, Population, Social aspects, Social impact, Safety, Urban areas, Warning systems, Foreign research, *Forecasting.
Identifiers: Earthquake focus, *Earthquake forecasting, Earthquake zones, Epicenters, USSR.

The possibility of accurately predicting the time of an earthquake is an unusually attractive prospect. Given advanced warning, persons living in cities could leave for places of safety. Damages would be limited to the destruction of empty buildings; thousands of lives would be saved. Looking at the practical aspects, earthquake prediction is very different from this idyllic situation. Prediction of occurrence-time apparently has priority over the prediction of when, how violently, and how frequently earthquakes may be expected. The scientific validity of earthquake-time prediction is very low and the effects of very unreliable earthquake-time prediction have yet to be considered. The lack of precision could cause serious mental trauma to populations waiting for an earthquake to strike, and the disruption of normal daily life would have far-reaching economic consequences to industry and Government. Earthquake-time prediction should not be neglected, but should be given an appropriate part in a thoroughly thought out and widely based multiple-prediction program. Determination of place and force of an approaching earthquake has developed from a theoretical study to a practical job, and should be given top priority in earthquake prediction for years to come. FAILURE OF FRACTURED ROCK,
National Mechanical Engineering Research Inst., Pretoria (South Africa).
Z. T. Bieniawski, H. G. Denkhaus, and U. W. Vogler.
Int J Rock Mech Mining Sci, Vol 6, No 3, p 323-341, May 1969. 23 p, 17 fig, 1 tab, 11 ref, 2 append.

Descriptors: *Rock mechanics, Rock properties, Quartzite, *Compressive strength, *Failure (Mechanics), Fractures, Rock excavation, *Rupturing, Stress, *Stess-strain curves, Strain, Testing machines, Sandstones, Test procedures, *Triaxial compression, Underground structures, Unconfined compression, Fractures (Geology).
Identifiers: Rockbursts, Rock tests, Foreign testing, Underground openings, Confining pressure, South Africa, *Multiaxial tests.

The most effective way of studying failure of fractured rock is by determining the complete stress-strain characteristics of the rock. Experimental techniques and multiaxial compression testing procedures are prescribed for determining the complete stress-strain curves for hard and soft rock. Special equipment was designed for this purpose. Test results are given on soft sandstone, hard quartzite, and hard norite. Modes of failure are reviewed. The strength and deformation characteristics of fractured rock are discussed and the significance of the test results is outlined. (USBR)

DETERMINATION OF THE COMPRESSIVE STRENGTH OF ROCK IN SITU OR IN TEST BLOCKS USING A DIAMOND DRILL,
National Technical Univ., Athens (Greece).
C. E. Tsoutrelis.
Ink, J Rock Mech Mining Sci, Vol 6, No 3, p 311-321 May 1969. 12 p, 6 fig, 3 tab, 12 ref, append.

Descriptors: *Rock mechanics, Rocks, Rock properties, Test procedures, *Drill holes, *Drilling, *Boreholes, Penetration, *Compressive strength, Unconfined compression, Engineering geology, Laboratory tests, Field tests.
Identifiers: *Rock tests, *Diamond drilling, Drillability index, Foreign testing, Greece, In situ tests, In situ rock.

A method has been developed for determining the compressive strength of rock in situ or in test blocks. Two equations are derived from experimental data to relate uniaxial compressive strength to diamond drill penetration rate. The validity of the method has been tested in the laboratory and in situ on several rocks ranging in compressive strength from 500 to 1300 kp/sq cm. Results are in good agreement with the Bureau of Mines standard procedure for compressive strength. The method (1) avoids the difficulties of specimen preparation, (2) is not affected by invisible cracks or discontinuities in the rock, (3) shows that compressive strength determination becomes more representative for the rock mass as drilling distance increases, and (4) is particularly useful for underground operations where a diamond drill is generally available. SHEAR STRENGTH OF REINFORCED CONCRETE BEAMS,
Swedish Geotechnical Inst., Stockholm.
Bengt B. Broms.
Proc Amer Soc Civ Eng, J Struct Div, Vol 95, No ST6, p 1339-1358, June 1969. 20 p, 12 fig, 1 tab, 19 ref, append.

Descriptors: *Shear strength, *Reinforced concrete, Girders, Rotation, *Beams (Structural), Cracks, Structural engineering, Flexural strength, Reinforcement, Stress distribution, Laboratory tests, Strain, Failure (Mechanics), Stress concentration, Compression, Bibliographies, Shear.
Identifiers: *Diagonal tension, Stirrups, Ultimate strength.

Stress distribution at failure and failure modes of reinforced concrete beams with and without web reinforcement failing by shear-compression have been investigated. Behavior of these members is unaffected by the presence of the web reinforcement until one or several inclined cracks have formed within the shear span. The fact that diagonal tension cracks initiate at or close to existing flexural cracks indicates that the secondary stresses caused by the flexural cracks affect the diagonal tension cracking load. Stress redistribution taking place at the diagonal tension cracking load is caused by internal local rotation, increasing the width of the diagonal tension cracks. The crack width is proportional to the distance from the center of rotation at the apex of the diagonal tension crack. The ultimate strength of beams failing by shear-compression is dependent on the location of the diagonal tension crack within the compression zone, and the shear span ratio. The diagonal tension crack is located at the center of the compression zone. (USBR)

REVETMENT CONSTRUCTION BY FABRIFORM PROCESS,
Intrusion-Prepakt Inc., Cleveland, Ohio.
Bruce A. Lamberton.
Proc Amer Soc Civ Eng, J Constr Div, Vol 95, No CO1, p 49-54, July 1969. 6 p, 5 fig.

Descriptors: Construction, Construction materials, Textiles, *Concrete construction, Concrete structures, Columns, Embankments, Nylon, *Erosion control, *Formwork (Construction), *Revetments, Mortar, Bank protection, Slope protection.
Identifiers: Construction methods, *Facings, Fabrics, *Fabriform method, *Concrete linings.

The Fabriform process employs a high-strength, water-permeable, synthetic fabric as a concrete forming material. The water-cement ratio is reduced by forcing vehicle water through the fabric, causing substantial increase in strength and very rapid stiffening. Proper fabric design is essential to avoiding mortar loss. Applied to construction of erosion-control revetments, dual-wall fabric is placed on the surface to be protected and filled with mortar. The 2 layers of fabric may be woven together at regular intervals to form filter points providing relief from hydrostatic uplift. A uniform cross section is also available, containing internal fiber reinforcing. Fabriform is a reliable method for placing revetments of predictable dimensions above and below water, and may be applied to columns and thin-shell structures.

INVESTIGATION OF CONCRETE PROTECTIVE SEALANTS AND CURING COMPOUNDS,
Pennsylvania Dept. of Highways.
P. D. Stewart, and R. K. Shaffer.
Highw Res Rec, No 268, p 1-16, 1969. 16 p, 4 fig, 13 tab, 1 ref.

Descriptors: Concretes, Concrete technology, Concrete testing, Curing, *Curing compounds, *Protective coatings, *Sealants, *Surface sealing, Laboratory tests, Freeze-thaw tests, Penetration, Bituminous materials, Bonding.
Identifiers: Surface treatment, Bond, Bond strength, Bond tests.

Thirty-two products used as concrete protective sealants and curing compounds were evaluated in a 4-phase testing program. In the first phase, the ability of penetrating-type sealants to protect concrete against the deteriorating action of freeze-thaw cycles was evaluated. Concrete specimens measuring 1 ft square were coated with various product applications, filled with a chloride solution (5%), and subjected to 100 cycles of freeze-thaw. Surface scaling was measured at intervals using a numerical value system. During the second phase, 10 products recommended as combination curing-sealing compounds were tested. The curing properties were determined by comparing compression strengths of product-cured and moist room-cured

cylinders. Slab specimens cured with each product were subjected to freeze-thaw tests. In the third phase, a test method was designed to measure depth of sealant penetration into the surface of a typical concrete slab. A fluorescent material was mixed with several products before application; penetration was measured by linear traverse equipment using ultraviolet light. The fourth phase was devoted to equipment design and methods for determining the effect of sealants on bond between concrete and bituminous overlays. (USBR)

THE EVALUATION OF CONCRETE BY OUTDOOR EXPOSURE,
Hydro-Electric Power Commission of Ontario, Toronto.
V. R. Sturrup, and T. G. Clendenning.
Highw Res Rec, No 268, p 48-61, 1969. 14 p, 18 fig, 3 ref.

Descriptors: Concretes, *Concrete technology, *Concrete testing, Fly ash, Freeze-thaw tests, *Field tests, Laboratory tests, Durability, Air entrainment, *Concrete additives, Aggregates, Scaling, Cracking, Water-cement ratio.
Identifiers: Deleterious materials, Entrainment, Concrete properties.

Studies on outdoor performance of concrete have included variations in the water-cement ratio, the paste composition, and the aggregate quality. Parallel tests were performed in laboratory freeze-thaw apparatus by the rapid water-freeze cycle. Results indicate that when only one variable is changed, the accelerated freeze-thaw and the outdoor exposure tests place similar concretes in the same relative order of durability. A difference was noted in the breakdown in outdoor exposure between that caused by nondurable paste and that caused by nondurable aggregates. Progressive scaling below the waterline is associated with breakdown in the paste, while progressive popping and cracking is associated with unsound aggregates. Entrained air will not protect a nondurable coarse aggregate but under certain conditions may delay deterioration. While the benefits of entrained air are evident in both tests, accelerated freeze-thaw overemphasizes its performance compared with nonair-entrained concrete. On the outdoor exposure tests, benefits of entrained air are most pronounced at high water-cement ratios. (USBR)
W70-00340

MECHANISMS OF FROST ACTION IN CONCRETE AGGREGATES,
Pennsylvania State Univ., University Park.
P. D. Cady.
J Mater, Vol 4, No 2, p 294-311, June, 1969. 18 p, 6 fig, 6 tab, 7 ref.

Descriptors: *Aggregates, *Concrete technology, Adsorption, Concretes, Differential thermal analysis, *Frost action, Durability, Freeze-thaw, Tests, Test procedures, Instrumentation, Concrete testing, Expansion, Coarse aggregates, Petrographic investigations.
Identifiers: *Adsorbed water theory, Dilation, Concrete properties, Hydraulic pressure theory, Volume change.

The hydraulic pressure theory proposed by Powers and the adsorbed water theory recently advanced by Dunn and Hudec to describe the destructive mechanisms of frost action on concrete aggregates were investigated. The theories were in direct opposition regarding the state of water during the period when coarse aggregate underwent destructive volume change. Nine aggregate fractions of known and widely varying durability were tested for adsorption. Differential thermal analyses were performed on concrete specimens containing test fractions to determine the degree of freezability of the evaporable water content. Expansion (dilations) of test specimens were also obtained during the DTA runs. Multiple correlation analyses of test variables and examination of changes in heat evolution and specimen length during cooling revealed that Powers' hydraulic pressure mechanism was the major contributor to destructive volume change. However, the existence of the mechanism proposed by Dunn and Hudec was consistently in evidence. The latter mechanism was a minor contributor to the destructive volume change, but was the major effect for one of the test aggregates. At least 2 basic mechanisms were involved in frost destruction of concrete aggregates. (USBR)

QUANTITATIVE ANALYSIS FOR CORROSION STUDIES BY THE MOSSBAUER EFFECT,
Princeton Univ., N.J. Dept. of Chemical Engineering.
Donald D. Joye, and Robert C. Axtman.
Anal Chem, Vol 40, No 6, p 876-878, May 1968. 3 p, 1 fig, 1 tab, 8 ref.

Descriptors: *Corrosion, *Chemical analysis, Chemical reactions, Rusting, Water chemistry, Well casings, Radiochemical analysis.
Identifiers: Mossbauer Effect.

The development of quantitative methods that utilize the Mossbauer Effect has lagged because of experimental difficulties. The corrosion of thin samples of iron, however, is a nearly ideal system for nondestructive, quantitative assay by a Mossbauer method. A constant acceleration spectrometer gave the ratio of the amount of unreacted iron to that of corrosion product formed in an atmosphere of water, Hydrochloric acid, and air. The spectrometer furnished an internal calibration for the method while a simple gravimetric technique provided an absolute calibration. Qualitative interpretation of the Mossbauer spectra aided in identification of the corrosion product. At room temperature the ratio of the Mossbauer efficiency of iron to that of the corrosion product is 1.61. (Knapp-USGS)

OPERATIONS RESEARCH AND THE MEASUREMENT OF MATERIALS,
Carborundum Co., Niagara Falls, N.Y.
Charles A. Bicking.
Mater Res Stand, Vol 9, No 6, p 8-13, 76, June 1969. 7 p, 8 fig, 5 ref.

Descriptors: Materials, Information retrieval, *Materials control, Materials engineering, *Materials testing, *Mathematical models, Digital computers, Mathematics, *Operations research, Experimental data, Quality control, Simulation, Specifications, Automatic control, Decision making, Instrumentation, Measuring instruments, PERT.
Identifiers: Materials information, Experimental design, Analog-to-digital converter.

Opportunities for direct coupling of materials science and operations research are described. In research and development, attention is directed to materials characterization, design, and analysis of experiments, and the selection and control of projects. In materials manufacture, areas of mutual activity include: (1) measurement and control of materials; (2) specification and acceptance or certification, including the design implications of materials; and (3) allocation of materials. Also discussed is the impact of computers in an age when requirements placed on materials are severe. In the future, simulation of applications will be the primary avenue of development new materials. (USBR)
W70-00325

LABORATORY INVESTIGATION OF AGING CHARACTERISTICS OF ASPHALT CEMENTS USED IN MEMBRANE LINING CONSTRUCTION,
Bureau of Reclamation, Denver, Colo.
W. R. Morrison.
Bur Reclam Lab Rep (ChE-91), Chem Eng Br, June, 1969. 40 p, 6 fig, 15 tab, 7 photo, 8 ref.

Descriptors: Laboratory tests, Asphalt, *Asphalt cement, Penetration, *Bituminous materials, Buried membranes, *Canal linings, Ductility, Data processing, Field tests, *Impervious linings, Materials testing, *Aging (Physical), Impervious membranes, Laboratory equipment, Weathering, Computer programming, Computers, Hardening.
Identifiers: Catalytically blown asphalt, Softening point, Product evaluation.

Laboratory test results indicate that the 14-day, 140 deg F oven aging test and the thin film oven test (ASTM D-1754) are satisfactory for determining the aging characteristics of asphalt cements used in membrane lining construction. Hardening is indicated by a decrease in penetration and ductility and an increase in softening point. These changes were reflected in the aging indexes. The 14-day aging test produced greater asphalt hardening. An aging index of 63.4 was obtained for asphalt cements subjected to the 14-day aging test, compared to an aging index of 73.7 for samples of the same asphalt cements subjected to the thin film oven test. New asphalt cements, by definition, have an aging index of 100. Comparing laboratory aging with field aging indicated that the 14-day, 140 deg F oven aging test produced asphalt hardening similar to that obtained at 14 yr field exposure. The thin film oven test produced asphalt hardening equivalent to 7 yr field aging. Based upon this investigation and other studies, asphalt cements now specified for Bureau of Reclamation membrane construction will provide satisfactory service for at least 14 yr. (USBR)

SYSTEMS APPROACH TO ORGANIC COATINGS,
Du Pont de Nemours (E.I.) and Co., Philadelphia, Pa.; and PPG Industries, Inc., Springdale, Pa.
T. R. Matthews, M. M. Coburn, and L. R. LeBras.
Metal Progr, Vol 95, No 6, p 67-74, June, 1969. 8 p, 3 fig, 3 tab.

Descriptors: *Painting, *Paints, Primers (Painting), Curing, Finishes, Organic compounds, *Protective coatings, Varnishes, Lacquers, *Coatings, Films, Application methods, Enamels, Durability, Materials engineering, Costs.
Identifiers: Product evaluation, Plastic coatings.

Factors involved in selecting and applying an effective and economical coating system are discussed in a series of 3 articles. Organic coatings differ from conventional paints and from each other in composition, application method, curing, and performance characteristics. Many product finishes are special systems formulated for a single user, but are of general availability. Selection of the correct coating is discussed and relative durability, advantages, and limitations are summarized. Several application methods are reviewed. Solvent evaporation, oxidation, and polymerization methods for curing organic coatings are reviewed, as well as a short summary on electron-beam curing. The selected coating must be compatible with the application and curing methods, and capable of achieving the desired performance. Primers and topcoats must form a strong adhesive bond and are preferred for procurement from the same manufacturer. A systems approach is required for evaluat-

ing and selecting an organic coating for a given application. (USBR)

10. SCIENTIFIC AND TECHNICAL INFORMATION

A SELECTED ANNOTATED BIBLIOGRAPHY ON THE ANALYSIS OF WATER RESOURCE SYSTEMS,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
Marshall Gysi, and Daniel P. Loucks.
New York Water Resources and Marine Sciences Center, Publication No 25, Aug, 1969. 177 p, 500 ref, 8 index charts. OWRR Proj W-111. Available from the Clearinghouse as PB 186 335, $3.00 in paper copy, and $0.65 in microfiche.

Descriptors: *Bibliographies, *System analysis, *Water resources, Optimization, Simulation analysis, Operations research, Abstracts.

Presented is an annotated bibliography of some selected publications pertaining to the application of systems analysis techniques to water-resource problems. The majority of the references included in this bibliography have been published within the last five years, mainly in Selected Water Resources Abstracts. About half of the entries have informative abstracts and keywords following the citation. Index charts give quick keyword access for all the references, the abstracted documents being completely keyworded, and the others title keyworded. The emphasis of the subject material abstracted is on optimization and simulation techniques that have been applied to water-resource problems.

SELECTED WATER RESOURCES ABSTRACTS

FEB 1 - 1970
UNIVERSITY OF ILLINOIS

VOLUME 3, NUMBER 2
JANUARY 15, 1970

W70-00418 -- W70-00835

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 2
JANUARY 15, 1970

W70-00418 -- W70-00835

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

01. NATURE OF WATER

1A. Properties

LAWS OF DISPERSION,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Mechanical and Aerospace Engineering.
Richard L. Peskin.
Water Resources Research Institute Report, Rutgers University, New Brunswick, N.J. Oct 20, 1969. 46 p.

Descriptors: *Dispersion, Energy transfer, Turbulence, Mixing, Suspension, Bubbles, Water properties.

Two problems on the laws of dispersion for materials such as small particles and gas bubbles in turbulent streams are considered. After discussing the mechanisms of single-particle dispersion, a statistical approximation model is used to calculate two-particle dispersion. Specifically, the Eulerian fluid velocity which appears in the equation of motion of a small particle is replaced by a random best estimate. This estimate is obtained by prediction techniques using specified statistical properties of the turbulence field. The second problem considered is that of gas bubble dispersion. An approximate analysis is used to estimate the spread of bubbles from a line source of bubbles. Buoyancy and turbulence inhomogeneity effects, which result in a bubble size segregation, are evaluated.

HYDROGRAPH STUDY AND PEAK DISCHARGE DETERMINATION OF HAWAIIAN SMALL WATERSHEDS: ISLAND OF OAHU,
Hawaii Univ., Honolulu.
I-Pai Wu.
Hawaii Univ, Honolulu, Water Resources Res Center Tech Rep No 30, Mar 1969. 85 p, 9 fig, 2 tab, 11 ref, 3 append. OWRR Proj No B-003-HI.

Descriptors: *Rainfall-runoff relationships, *Hydrograph analysis, *Recession curves, *Small watersheds, *Hawaii, Infiltration, Unit hydrographs, Topography, Statistical methods, Regression analysis.
Identifiers: *Oahu.

Hawaiian small watersheds are unique in watershed hydrology because of the high infiltration rate, small size, and mountainous topography. The flood hydrograph, which has a short time to peak and small recession constant, can be expressed as a steep triangular shape. A peak discharge equation is derived from the concept of a triangular hydrograph and a linear storage of recession flow. The peak discharge equation can be shown as a very simple linear form, a function of time to peak and the surface runoff in inches. A linearity test between peak discharge and runoff has been made for Hawaiian small watersheds and a good linear relationship was found between peak discharge and surface runoff which is less than 6 inches not only for an individual small watershed but for watersheds of similar size. (Knapp-USGS)

SURFACE-WATER RESOURCES OF THE YOBE RIVER SYSTEM, NORTHERN NIGERIA, 1963-68,
Geological Survey, Washington, D.C.
B. E. Colson.
Geol Surv Open-file Rep, Jan 1969. 201 p, 6 fig.

Descriptors: *River systems, *Data collections, *Water utilization, *Hydrologic budget, Tributaries, Forecasting, Evaluation, Surveys, Water quality, Hydrogeology, Erosion control, Organizations, Gaging stations, Surface-groundwater relationships, Flow rates, Sediments.
Identifiers: *Nigeria, Yobe River system, Lake Chad.

This report describes the general hydrologic features of the Yobe River system, Nigeria, and presents hydrologic data on gage heights, daily discharge, and chemical quality and sediment content data for water samples at 18 stations in the system. Records for one site begin in 1958, but most records are for the 1963-1968 period. The Yobe (Komadugu) is tributary to Lake Chad and drains a 33,000 sq mi area in semiarid northern Nigeria. Less than 10% of the total surface runoff from the Yobe River system reaches Lake Chad, owing to evapotranspiration losses and to a much less extent by infiltration to groundwater storage. In the upper Yobe basin geologic controls limit groundwater development to shallow wells of low yield in many places and water supplies are obtained mostly from surface sources. The tributary Kano and Jemari Rivers have excellent quality water of low sediment load, but the Challowa River has a high sediment load. An estimated 15%, or more, of the rainy season runoff could be stored and would meet anticipated demands. (Lang-USGS)

THE USE OF EXPONENTIAL FUNCTIONS WHEN CONSTRUCTING THE LAWS OF THE DISTRIBUTION OF GEOGRAPHICAL AND HYDROMETEOROLOGICAL PARAMETERS (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Meteorology; and Moscow State Univ. (USSR). Dept. of Climatology.
A. A. Dmitriev, and L. P. Uporova.
Russian text with English summary. Vestnik Moskov Univ, Ser 5, Geogr, No 4, p 100-105, July-Aug 1969. 6 p, 2 fig, 2 ref.

Descriptors: *Mathematical studies, *Hydrologic data, *Meteorological data, *Parametric hydrology, Probability, Statistical methods, Dispersion, Frequency analysis.
Identifiers: Exponential functions.

The use of a normalized orthogonal and exponential function for the study of the distribution of hydrometeorological and geographical parameters was investigated assuming certain types of distribution of parametric data. The study describes the possibility of the construction of some skew frequency curves by using a system of these orthogonal functions. Curves of some typical distribution laws are given and an approximate method for the evaluation of unknown parameters is presented. (Gabriel-USGS)

EARTHFLOW OCCURRENCE DURING HIGH INTENSITY RAINFALL IN EASTERN OTAGO (NEW ZEALAND),
Otago Univ., Dunedin (New Zealand). Dept. of Geography.
M. J. Crozier.
Eng Geol, Vol 3, No 4, p 325-344, Oct 1969. 10 p, 5 fig, 1 tab, 11 ref.

Descriptors: *Landslides, *Rainfall, *Erosion, Pore pressure, Soil water movement, Infiltration, Percolation, Seepage, Mass wasting, Rockslides.
Identifiers: *New Zealand, Otago.

The characteristics and effects of an unusually heavy rainstorm causing landsliding in eastern Otago, New Zealand are discussed. The storm produced up to 8 inches of rain in 48 hr during a month, which, over the last 20 yr, has had a mean of 2.03 inches. These weather conditions triggered numerous landslides in an area which is believed to have become progressively unstable over the last 100 yr. A theory for the progressive development of unstable land in the locality is outlined. It centers around the change of soil properties induced by a removal of the indigenous forest. The relevant morphological and geological characteristics of a typical earthflow are listed and an account is given of the observed processes of earthflow occurrence. (Knapp-USGS)

HYDROLOGICAL REQUIREMENTS FOR WEATHER RADAR DATA,
A. F. Flanders.
World Meteorol Organ/Int Hydrol Decade Proj Rep No 9, 1969. 16 p, 1 tab, 16 ref.

Descriptors: *Radar, *Precipitation (Atmospheric), *Precipitation gages, *Instrumentation, Network design, Precipitation intensity, Surveys, Research and development, Rainfall, Snowfall, Meteorology.
Identifiers: Radar precipitation gaging, Meteorological radar.

Direct quantitative measurement of the average precipitation depth over drainage units would be a valuable tool in hydrological forecasting. Precipitation measurement by means of ground-based weather radar is being investigated in a number of countries. This report gives a brief survey of hydrological requirements for weather radar data based on experience in the U.S.A. with the Weather Bureau's radar network, and traces the application made of radar data to hydrological forecast problems encountered by the U.S. Weather Bureau. POSSIBILITIES OF MAJOR CLIMATIC MODIFICATION AND THEIR IMPLICATIONS: NORTHWEST INDIA, A CASE FOR STUDY,
Wisconsin Univ., Madison.
Reid A. Bryson, and David A. Baerreis.
American Meterological Society, Bulletin, Vol 48, No 3, p 136-142, March 1967. 3 fig, 20 ref.

Descriptors: *Weather modification, *Deserts, *Dust storms, *Precipitation (Atmospheric), Arid lands, Climatology, Meteorology, Vegetation effects, Vegetation establishment, Monsoons, Economic impact, Social aspects.
Identifiers: *India, *West Pakistan, *Rajputana Desert, *Rajasthan Desert, *Subsidence (Atmospheric), Archaeology, Intermittent occupation.

Field observations and theoretical studies indicate that dense dust over northwest India and West Pakistan is a substantial factor in development of subsidence over the Rajasthan Desert. In the absence of this dust, there would be less radiation divergence in mid-tropósphere and thus, less subsidence and a deeper monsoon layer, with rains extending farther into the present desert area. Archaeological evidence suggests a long pattern of intermittent occupation with man playing an important part in making the desert. If man could establish a stablizing grass cover, there would be little blowing dust and the average subsidence would be reduced by perhaps one-third. This might result in more instability and increased showers during the day and increased dew formation on the grass at night. Social and economic consequences are outlined briefly. (Crouse-Arizona)

THREE-DIMENSIONAL SURGES AND RECOVERIES IN A NUMERICAL GLACIER MODEL,
Geological Survey, Tacoma, Wash.
William J. Campbell, and Lowell A. Rasmussen.
Canadian J Earth Sci, Vol 6, No 4, Part 2, p 979-986, Aug 1969. 8 p, 7 fig.

Descriptors: *Glaciers, *Surges, *Mathematical models, Regimen, Cryology, Rheology, Ice, Mountains, Frequency, Precipitation (Atmospheric), Slopes, Flow, Climates, Friction, Heat flow.
Identifiers: Glacier surges, Surging glaciers, Navier-Stokes equation.

To calculate glacier surges, the Navier-Stokes equation, integrated vertically to yield a 2-dimensional transport equation, is combined with the 3-dimensional continuity equation. By assuming a linear relation between volume transport and bottom shear stress, a system of numerically tractable differential equations is developed that contains a nonlinear surface slope term and a term in which horizontal frictional forces are stated explicitly. These equations, which are not based on perturbation analysis, are integrated directly on a high speed digital computer. The coefficient of each term in the flow equations is composed of physical parameters (gravity, density, viscosity); therefore, since no quantities such as ice velocities enter the equations, it is only necessary to specify an arbitrary bed configuration and a net-balance versus altitude curve to obtain a glacier solution. For 2 beds, valley and cirque, steady-state glacier solutions are found for a variety of bed and lateral frictional values. By reducing the bed friction coefficient for one year over the entire bed of the glacier, surges are induced in each of these cases. A reduction in bed friction to 5% of its original value yields a surge resembling typical observed surges. Interesting wave forms occur during the recovery. During the initial recovery, after the bed friction has been restored to its original value, height falls continue to occur even in the lower accumulation zone. The original steady-state shape is approached asymptotically, with total recovery taking hundreds of years. (Knapp-USGS)

Identifiers: *Thermal structure, Vertical profiles, Deep sea research.

Sophisticated electronic systems now in use by oceanographers to obtain continuous temperature and salinity profiles show that the vertical temperature profile in the oceans may be complex. Fine scale vertical temperature measurements in an Arctic water column are described; they show the presence of several cascaded isothermal layers. Layers between depths of 300 and 350 meters range from 2 to 10 meters in thickness, while the temperature change between adjacent layers is approximately 0.026 deg C. The individual layers are isothermal to within plus or minus 0.001 deg C. (Lang-USGS)

HYDROLOGY OF FROZEN GROUND FLOODS,
Idaho Univ., Moscow. Water Resources Research Inst.
G. L. Bloomsburg, and S. J. Wang.
Available from the Clearinghouse as PB-187 269 $3.00 in paper copy, $0.65 in microfiche. Idaho Water Resources Research Institute, Research Technical Completion Report, June, 1969. 13 p. OWRR Project A-016-IDA.

Descriptors: *Hydrologic properties, Permeability, Porous media, *Soil properties, Frozen soils, Percolating water, Soil moisture.

A four year field and laboratory study of permeability of frozen soil is reported. The field studies involved temperature and moisture measurements over a two year period during which there were no runoff events when the ground was frozen. A rainfall simulator was constructed and used to a limited extent the second year of the study. The laboratory study involved measuring the permeability of frozen soil columns at various initial moisture contents. Air was used as a fluid to measure the permeability under isothermal conditions below 32 deg F. Data were obtained which relate the air permeability to the porosity of the soil and the moisture content or saturation at which freezing occurred. For the three soil types tested, it was possible to obtain impermeable conditions after freezing when the initial moisture content was in the neighborhood of the field capacity. The significant parameter affecting the permeability was 0 (1 - S) where 0 is the porosity and S is the saturation. The use of certain critical values of this parameter would enable a person to predict when the possibility of frozen ground floods exist by taking soil samples in the field. The critical values for various soils would have to be determined from field

permeability measurements. (Corey-Univ of Idaho)

SNOWPACK MANAGEMENT,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Henry W. Anderson.
IN Snow, Oregon State Univ, Water Resources Inst Seminar, WR 011.69, p 27-40, 1969.

Descriptors: *Snow management, *Watershed management, *Snowpacks, *Snowmelt, *Forestry, *Lumbering, Water supply, Floods, Evaporation, Condensation, Snow accumulation, Brush control, Mechanical control, Solar radiation, Advection, Streamflow, California, Colorado.
Identifiers: *Forest cutting patterns.

Summarizes results of research in California and Colorado on accumulation of snow, snowmelt, and disposition of snowmelt water as affected by forest cutting patterns, clearing of brushfields, and mechanical control of snow drifting. The implications to water yield and water supply are suggested. Revised estimates of increase in streamflow under three types of forest cuttings are given with increases the first year after cutting ranging from six inches in selection cut to 12 inches in strip cut. Duration of cutting affects on snow accumulation and soil moisture savings are given. Data are shown which indicate that snowmelt contribution to floodwaters may be mostly due to sensible heat of condensation during rainstorms, adding 2.7 inches of melt in a three day rain storm of 11 1/2 inches. Advection and condensation melting together added 4.1 inches and melt by rain 0.5 inches; thus snowmelt contributed 30 percent of the flood water. Differences in advection and condensation between large block-cut areas versus selection or strip-cut areas may make for significant differences in the snowmelt contribution to floodwaters between forest cutting methods.

N. J. Rosenberg, K. W. Brown, T. A. Hales, P. C. Doraiswamy, and D. E. Sandin.
Horticulture Program Rep No 73. Nebr Univ Water Resources Res Inst Proj Completion Rep, July 1969. 153 p, 47 fig, 17 tab, 85 ref. OWRR Proj No A-001-NEB.

Descriptors: *Evapotranspiration, *Consumptive use, Lysimeters, Evapotranspiration control, Advection, Water balance, Water loss, Energy budget, Climatology, Instrumentation, Computer programs.
Identifiers: Evapotranspiration estimating.

A lysimetric research facility was constructed at the University of Nebraska Field Laboratory at Mead. A 6-acre field was equipped for irrigation. Two precision weighing lysimeters and meteorological instrumentation were assembled, tested and combined into functional systems. Data logging and instrumental control systems were developed and integrated for study of the physics of evapotranspiration processes in the natural environment. Evaporation from bare soil was studied during 1966 after installation of the lysimeters. Data were assembled on the magnitude and rate of evaporation from bare soil under summer and fall conditions and under conditions where the lysimeter served as an oasis. Maximum summer evaporative flux was found to be on the order equivalent to an energy consumption of 1.2 cal/sq cm. Maximum 24-hr evaporation during summer was about 0.31 inches. Nocturnal evaporation accounted for about 10% of the total evaporation from bare soil. Maximum evaporation from newly seeded soil in fall was about 0.12 inches/day, with a maximum evaporative flux energy consumption during any one day of about 0.5 cal/sq cm/min. Greenhouse and field trials of antitranspirant chemical effectiveness on alfalfa were conducted during 1967 and 1968. Results to date have been contradictory. (Knapp-USGS)
W70-00450

EVAPOTRANSPIRATION CLIMATONOMY: 1. A NEW APPROACH TO NUMERICAL PREDICTION OF MONTHLY EVAPOTRANSPIRATION, RUNOFF, AND SOIL MOISTURE STORAGE,
Wisconsin Univ., Madison. Dept. of Meteorology.
H. Lettau.
Res supported in part by Atmos Sci Lab, US Army Electronics Command, Fort Huachuca, Ariz. Monthly Weather Rev, Vol 97, No 10, p 691-699, Oct 1969. 9 p, 3 tab, 13 ref. Grant No DA-AMC-28-043-66-G24 (USAEC).

Descriptors: *Evapotranspiration, *Water balance, *Climatology, Mathematical models, Mathematical studies, Hydrologic budget, Soil moisture, Evaporation, Runoff.
Identifiers: Climatonomy.

A theoretical method is given to solve the water balance equation for land areas. A forcing function is essentially determined by the product of absorbed solar energy multiplied by monthly precipitation; the response function is soil moisture in its month-to-month variations. A very simple parameter is a nondimensional surface characteristics named the 'evaporivity' (which measures the fraction of absorbed insolation utilized during the month in the vaporization of concurrent precipitation) and a characteristic lag-time interval of the order of 2 to 3 mo to express 'delayed' evapotranspiration and runoff. The solution is obtained by a closed integration of the water balance equation and yields a coherent set of data on monthly evapotranspiration, runoff, levels of exchangeable soil moisture, and storage changes. For verification, area averages for the central plains and eastern region of North America are calculated and compared with several years of actual data analyzed and evaluated by Rasmusson. In spite of simplifying tentative assumptions used in the model calculation, the agreement between predicted and observed data is improved in comparison with results of the earlier prediction methods discussed by Rasmusson. (Knapp-USGS)
W70-00654

ADVECTIVE CONTRIBUTION OF ENERGY UTILIZED IN EVAPOTRANSPIRATION BY ALFALFA IN THE EAST CENTRAL GREAT PLAINS (U.S.A.),
Nebraska Univ., Lincoln. Agricultural Experiment Station; and Nebraska Univ., Lincoln. Dept. of Horticulture and Forestry.
N. J. Rosenberg.
Agricultural Meteorology, Vol 6, No 3, p 179-184, May, 1969. 2 tab, 1 fig, 12 ref. OWRR Project A-001-NEB.

Descriptors: *Great Plains, *Advection, *Evapotranspiration, *Alfalfa, *Lysimeters, Evaporation pans, Nebraska, Arizona, California, Instrumentation, Heat Budget.

Lysimetric measurements of evapotranspiration from well-watered alfalfa crops in the east-central Great Plains show that advection of sensible heat contributes an important share of the energy consumed in evaporation. Daily and hourly evapotranspiration rates were at times as great as those recorded in arid Arizona and at semiarid Davis, California. The study was conducted on a lysimeter covered with 25 cm high alfalfa located in a similarly covered 1 3/4 ha experimental field. The soil in the lysimeter and surrounding area was at field capacity at the beginning of the 3 day study. Measurements were made of air temperature, dewpoint, wind speed and direction, solar radiation, net radiation and soil heat flux. Latent heat consumption exceeded the quantity of net radiation minus soil heat flux (Rn-S) by 140, 324, and 200 ly/day, respectively. (Crouse-Arizona)
W70-00690

PATTERNS OF THE THERMAL REGIME OF THE SURFACE LAYER OF WATER,
M. P. Timofeyev, and S. P. Malevskiy-Malevich.
Translated from Meteorologiya and Gidrologiya, No 2, 1967, p 57-65. Soviet Hydrology, Selected Papers, No 1, p 102-109, 1967. 7 p, 6 tab, 2 fig, 14 ref.

Descriptors: *Air-water interface, *Water temperature, Thermal stratification, Heat transfer, Thermal conductivity.
Identifiers: USSR.

The characteristics of the thin surface layer of water, which effects the different forms of heat exchange between the free water surface and the atmosphere, were studied. Experiments in a lake and in an evaporation pan measuring 20 m sq were conducted at the Valday Hydrologic Scientific Research Laboratory to determine the average thermal conductivity coefficient of the surface layer of water. Measurements in the lake were made from a hydrologic raft. The water surface temperature and effective radiation were measured by radiometer. The water temperature profile was measured with a resistance thermometer at depths of 2, 10, 50 and down to 500 cm. and penetrating radiation was measured at depths 2, 5, 10, 30, 50, 100 and 200 cm. Meteorological elements were also determined. The difference between temperature of the water surface (Ts) and the underlying layers (Tu): Ts - Tu were determined and also for data of Lakes Sevan and Baikal and the North Atlantic Ocean. Simular computations were done for various latitudes of the Pacific Ocean along 180 deg meridian. The conclusion was that under normal conditions, except during severe storms, the temperature gradient in the upper layer of water remains negative. Thermal conductivity characteristics of the surface layer were noted as stable, with a vertical gradient. (Guerrero-Vanderbilt)
W70-00741

COMPUTATION OF THE COMPONENTS OF THE THERMAL BALANCE OF PLANNED RESERVOIRS,
L. V. Nesina.
Translation from Transactions of the Voyey Kov Main Geophysical Observatory, (Trudy GGO), No 206, p 31-37, 1967. Soviet Hydrology, Selected Papers, No 1, p 183-189, 1967. 6 p, 2 tab, 4 fig, 13 ref.

Descriptors: *Reservoirs, *Heat balance, *Evaporation, Air temperature, Water temperature, Humidity, Wind velocity.
Identifiers: Thermal balance.

A method of determining the components of the thermal balance of planned reservoirs is examined. The method is based on computations of the water surface temperature, air temperature and humidity, and wind velocity over the surface of the reservoir. Examples of the computation of the components of the thermal balance are given for reservoirs of various dimensions and depths, and the results of the computations are analyzed. Conclusions were: (1) The depth of a reservoir has a significant effect on the components of the thermal balance, and (2) The dimension of a reservoir has an insignificant effect on the components of the thermal balance. (Guerrero-Vanderbilt)
W70-00744

2E. Streamflow and Runoff

STAGE-DISCHARGE CHARACTERISTICS OF A WEIR IN A SAND-CHANNEL STREAM,
Geological Survey, Washington, D.C.
D. D. Gonzalez, C. H. Scott, and J. K. Culbertson.
Geol Surv Water-Supply Pap 1898-A, 1969. 29 p, 17 fig, 1 tab, 6 ref.

Descriptors: *Stage-discharge relations, *Gaging stations, *Control, *Flow measurement, *Water levels, Weirs, Rio Grande, Model studies, Instrumentation, Water control, Alluvial channels, Stream gages.
Identifiers: Bernardo (N Mex).

An artificial control on a sand-channel stream must control both the resistance to flow and the bed elevation in order to stabilize the relation between water-surface elevation and water discharge. The weir (control structure) in the Rio Grande conveyance channel near Bernardo, N. Mex., was designed on the basis of a model study and field data. About 72% of the measurements used to define the base relation between water-surface elevation and water discharge falls within 5% of the mean relation for the prototype. The stage-discharge relation is not affected by backwater for values of submergence less than 90%. There is no consistent relation between the ratio of measured discharge to rated discharge and submergence for values of submergence greater than 90%. When the control is drowned out, or ineffective, the relation of water-surface elevation to water discharge is virtually the same as that prior to construction of the control for discharges greater than 1,500 cfs. When the control is not drowned out the water-surface elevation for a discharge of 2,000 cfs is greater than the minimum elevation, but is less than the maximum elevation that occurred at that discharge prior to construction. (Knapp-USGS)
W70-00418

WATER RESOURCES OF RANDOLPH AND LAWRENCE COUNTIES, ARKANSAS,
Geological Survey, Washington, D.C.
A. G. Lamonds, Marion S. Hines, and Raymond O. Plebuch.
Geol Surv Water-Supply Pap 1879-B, 1969. 45 p, 18 fig, 8 tab, 19 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Arkansas, Water supply, Streamflow, Water wells, Aquifers, Water quality, Water utilization, Hydrogeology, Hydrologic data, Data collections, Water yield.
Identifiers: Randolph County, Lawrence County (Ark).

Water is used at an average rate of almost 27 mgd in Randolph and Lawrence Counties, and quantities sufficient for any foreseeable use are available. Minimum recorded flows of 4 streams (Black, Current, Eleven Point, and Spring Rivers) exceeded 200 cfs, or 129 mgd 95% of the time. Water supplies can be obtained without storage from the larger streams in the area. Many of the smaller streams in the Interior Highlands also have large water-supply potential because of the excellent impoundment possibilities. Most of the water in the 2 counties is obtained from groundwater reservoirs in the Coastal Plain. Wells that tap alluvial deposits of Quaternary age commonly yield 1,000 gpm. However, the water often is unsuitable for many uses unless treated to remove hardness, iron, and manganese. Wells in the Interior Highlands generally are less than 200 ft deep and yield 10 gpm, or less. Groundwater in the Interior Highlands is very hard and is more susceptible to local bacterial contamination than is groundwater in the Coastal Plain. However, with proper sanitary safeguards against contamination and with treatment for reduction of hardness, groundwater in the Interior Highlands is suitable for most uses. (Knapp-USGS)
W70-00420

GENERALIZATION OF STREAMFLOW CHARACTERISTICS FROM DRAINAGE BASIN CHARACTERISTICS,
Geological Survey, Washington, D.C.
D. M. Thomas, and M. A. Benson.
Geol Surv Open-file Rep, 1969. 45 p, 16 fig, 11 tab, 18 ref.

Descriptors: *Rainfall-runoff relationships, *Runoff, *Runoff forecasting, *Statistical models, Regression analysis, Correlation analysis, Topography, Climates, Rainfall, Streamflow, Streamflow forecasting.
Identifiers: *Drainage basin analysis.

Statistical multiple-regression analyses provide a generalized definition of the natural streamflow in four widely separated regions of the eastern, central, southern, and western areas of the United States. In each study region, every long-term essentially natural streamflow record was characterized by 71 or more flow indices. These indices represented magnitudes of high, low, and medium flow, topography, climate, and also the distributions of flows in time. Multiple-regression analyses then defined the relation between each flow characteristic and the drainage basin characteristics. Streamflow characteristics can be defined more accurately in the humid eastern and southern regions than in the more arid western and central regions, medium flows can be more accurately defined than high flows, and low flows can be only weakly defined. Standard deviations of monthly and annual flows were found to be significantly related to basin characteristics. Some indices of flow distributions in time (serial correlation and skew coefficients) could better be described by regional averages. Regression relations may be used to estimate many natural-flow characteristics at any site in the study regions. In addition, the knowledge of basin characteristics provides a firm technical basis for modifying and improving the existing streamflow data-collection system. (Knapp-USGS)

HYDROLOGIC EFFECTS OF THE EARTHQUAKE OF MARCH 27, 1964, OUTSIDE ALASKA,
Geological Survey, Washington, D.C.
Robert C. Vorhis.
Geol Surv Prof Pap 544-C, p C1-C54, 1967. 54 p, 24 fig, 7 tab, 63 ref.

Descriptors: *Earthquakes, *Alaska, *Water level fluctuations, *Data collections, Surface waters, Groundwater, Lakes, Streams, Water wells, Aquifers, Seismic waves, Seiches, Tsunamis, Hydrologic data, Hydrogeology.
Identifiers: Earthquake hydrologic effects, Seismic seiches, Hydroseisms.

The Alaska earthquake of March 27, 1964, had widespread hydrologic effects throughout practically all of the United States. More than 1,450 water-level recorders, scattered throughout all the 50 States except Connecticut, Delaware, and Rhode Island, registered the earthquake. The earthquake is also known to have registered on water-level recorders on wells in Canada, England, Denmark, Belgium, Egypt, Israel, Libya, Philippine Islands, South-West Africa, South Africa, and Northern Territory of Australia. The Alaska earthquake is the first for which widespread surface-water effects are known. The effects were recorded at stations on flowing streams, rivers, reservoirs, lakes, and ponds. Most of the fluctuations recorded can be referred to more precisely as seismic seiches; however, a few stations recorded the quake as a minor change in stage. The largest recorded seiche outside Alaska was 1.83 ft on a reservoir in Michigan. The next largest was 1.45 ft on Lake Ouachita in Arkansas. The largest fluctuation in a well was 23 ft registered by a pressure recorder near Belle Fourche, S. Dak. Fluctuations of more than 10 ft were reported from wells in Alabama, Florida, Georgia, Illinois, Missouri, and Pennsylvania. A 3.40 ft fluctuation was recorded in a well in Puerto Rico. (Knapp-USGS)

A. M. Moore.
Geol Surv Water-Supply Pap 1819-K, p K1-K53, 1967. 53 p, 10 fig, 1 plate, 6 tab, 7 ref.

Descriptors: *Water temperature, *Correlation analysis, *Streamflow, *Surveys, *Oregon, Water quality, Thermometers, Surface waters, Forecasting, Data collections, Hydrologic data.
Identifiers: Oregon stream water temperatures, Thermographs.

Procedures are developed to correlate spot observations of water temperature with a representative thermograph record to estimate monthly means and extremes at the site where the spot observations were made. In general, these synthetic figures represent probable water temperatures at the spot-observation site during the period of record for the thermograph site. Tests indicate that the average errors in the estimates of monthly means and extremes are about 1 deg and 2 deg, respectively in the Oregon streams measured. The correlations are useful in assessing the effect of reservoirs on downstream water temperatures. The accuracy of the instruments and the methods used by the Geological Survey result in water-temperature records that are considered to be accurate within about 1 deg. Because water temperature in a given month varies from year to year, 2 rough guides are developed to assist in appraising short-term records with respect to long-term means and extremes of water temperature. The cold summer of 1955 and the warm summer of 1958 contain extremes that represent at least 25-year events. During the summer months, water temperature varies considerably even during one day. The amount of diurnal fluctuation can be significant and, in natural streams, depends largely on the amount of solar radiation absorbed, the amount of water to be warmed or cooled, and the amount and location of contributory spring flow. The maximum diurnal fluctuation at 129 thermograph sites is shown in tabular form. This listing can be used to estimate maximum diurnal fluctuation of water temperature in streams for which no thermograph records are available. (Knapp-USGS)

SURFACE WATER AND RELATED CLIMATE FEATURES OF THE SAHIL SUSAH AREA, TUNISIA,
Geological Survey, Washington, D.C.
L. C. Dutcher, and H. E. Thomas.
Geol Surv Water-Supply Pap 1757-F, p F1-F40, 1967. 40 p, 10 fig, 4 plate, 12 ref.

Descriptors: *Water supply, *Climates, *Surface waters, Runoff, Streamflow, Water resources, Arid lands, Rainfall-runoff relationships, Irrigation water, Municipal water.
Identifiers: Sahil Susah area (Tunisia).

The water supplies available to the people of central Tunisia are discussed. About 80% of the areas people inhabit the Sahil Susah (coastal area) and

the bordering Low Steppe. These lowlands receive water directly by precipitation and also by surface and underground flow from the High Steppe and the mountains. The median annual precipitation upon the Sahil and Low Steppe is about 280 mm which is less than one-fourth of the potential annual evaporation rate, and even in the winter 'rainy' season precipitation is less than half the evaporation rate. Thus on the basis of averages there is a net water deficiency throughout the year. In about 10% of the past 60 yr, precipitation has been great enough to sustain nonirrigated agriculture. In nearly 50% of the years, precipitation has contributed so little water to the soil that most crops not close enough to the coast to benefit from the nocturnal humidity there would fail without irrigation. The temporary excesses in precipitation provide occasional surpluses of water. Available records indicate that the streams draining the mountain range on the northwest (Dorsale) in central Tunisia have high maxima and flash-flood runoff but negligible flow in rainless periods. High evaporation losses, increasing salinity, sediment accumulation in reservoirs, and lack of suitable sites for dams or reservoirs are formidable handicaps to surface storage. For perennial supply, the surface flow should be stored in suitable groundwater reservoirs from which it could be pumped out as needed. (Knapp-USGS)

HYDROLOGIC DATA FOR THE OAK RIDGE AREA, TENNESSEE,
Geological Survey, Washington, D.C.
William M. McMaster.
Geol Sur Water-Supply Pap 1839-N, p N1-N60, 1967. 60 p, 21 fig, 13 tab, 36 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Surveys, *Tennessee, Streamflow, Low flow, Aquifers, Water yield, Water quality, Water utilization, Hydrogeology, Hydrologic data, Data collections.
Identifiers: *Oak Ridge (Tenn).

The Oak Ridge, Tenn., area is abundantly supplied with water. Annual rainfall ranges from 46 inches in the northeastern part of the area to more than 58 inches in the northwestern part; areal mean rainfall is 51.2 inches. Streamflows equaled or exceeded 90% of the time range from 0.04 cfsm for streams draining areas underlain entirely by sandstone and shale to 0.58 cfsm for streams draining areas underlain mostly by dolomite and limestone. The Knox Dolomite is the principal aquifer of the area; several large springs flow from the Knox, the largest of which is Bacon Spring, which has a mean discharge of about 3.8 cfs. Groundwater is not adequate as a source of large supply. It is estimated that the average well in the area would yield not more than 10 gpm and that very few wells would yield more than 50 gpm. In general, the water in streams in the Oak Ridge area is moderately hard to very hard and has a low content of sodium, potassium, and chloride. Four streams receive industrial or municipal wastes which alter their chemical quality. Several of the small streams in the Oak Ridge area are used for waste disposal, and one is used as a part of an arboretum. Groundwater development is small; at present, several springs are used for community or utility district supplies. Very large supplies of surface water from the Clinch River are presently developed in the area. Most of this supply is used by U.S. Atomic Energy Commission and Tennessee Valley Authority facilities. (Knapp-USGS)

RUNOFF FROM SMALL PEATLAND WATERSHEDS,
Forest Service (USDA), Grand Rapids, Minn. Northern Conifers Lab.
Roger R. Bay.
J Hydrol, Vol 9, No 1, p 90-102, Sept 1969. 13 p, 6 fig, 1 tab, 7 ref.

Descriptors: *Runoff, *Water storage, *Bogs, *Minnesota, *Low flow, Recession curves, Rainfall-runoff relationships, River regulation, Hydrographs, Streamflow forecasting, Precipitation (Atmospheric), Infiltration, Water yield, Small watersheds.
Identifiers: Peat bogs, Bog watersheds.

Runoff was measured on 4 forested bog watersheds in northern Minnesota for 5 years. The experimental basins ranged in size from 24 to 130 acres and included both organic and mineral soils. Annual runoff was not evenly distributed. Spring runoff, from the beginning of flow in late March to the 1st of June, accounted for 66% of total annual water yield. Summer and fall runoff was normally very low and ceased on most of the bogs during each summer. Annual peak rates of discharge were low and recessions were long, indicating the bogs were effective as storage areas for short-term runoff. However, they were not effective as long-term storage areas or regulators of streamflow. (Knapp-USGS)
W70-00675

SURFACE WATER IN THE ERIE-NIAGARA BASIN, NEW YORK,
Geological Survey, Albany, N.Y.
W. E. Harding, B. K. Gilbert, and R. M. Beall.
NY State Water Resources Comm Basin Planning Rep ENB-2, 1968. 118 p, 42 fig, 6 plate, 16 tab, 20 ref, append.

Descriptors: *Streamflow, *Surface waters, *New York, *Data collections, *Hydrologic data, Surveys, Gaging stations, Floods, Hydrographs, Draft-storage curves, Precipitation (Atmospheric), Runoff.
Identifiers: Erie-Niagara Basin (NY).

The Erie-Niagara basin contains about 2,000 sq mi in western New York State. The drainage systems of the area discharge into Lake Erie and the Niagara River at an average rate of about 1,730 mgd. Annual precipitation ranges from about 32 to 44 inches. Evapotranspiration losses account for about 20 inches of water a year and the streams have an average annual runoff of about 18 inches. Mean annual runoff in the area increases as a function of the direct relationship between precipitation and elevation of the land surface; therefore, a map on a topographic base was developed from which mean annual runoff can be estimated for any stream in the area. Other maps present the regional distribution of flow at the 50, 90, and 99% duration points. Low-flow frequency analyses show the minimum flows expected to recur at various intervals of time for periods of 1, 7 and 30 consecutive days. Studies of high flows provided the basis for a regional analysis of flood frequency for streams with drainage areas larger than 10 square miles. Overbank flooding in the Erie-Niagara basin is most extensive in the Tonawanda Creek basin. Many floods are the result of the formation of ice jams, both in stream channels and at the mouths of streams entering Lake Erie, and are not necessarily caused by unusually high streamflows. (Knapp-USGS)

RECONNAISSANCE ESTIMATION OF STREAM DISCHARGE-FREQUENCY RELATIONSHIPS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
K. D. Woodyer, and P.M. Fleming.
In: G A Stewart, Ed, Land Evaluation Papers of a CSIRO Symposium in Cooperation with UNESCO August 26-31, 1968, Macmillan of Australia, p287-298, 1968. 3 fig, 2 tab, 25 ref.

Descriptors: *Stream flow, *Discharge measurement, *Peak discharge, *Watersheds (Basins), *Stage-discharge relations, Mannings Equation, Frequency, Small watersheds, Estimating, Data collections.
Identifiers: *Australia, *New South Wales, Queensland.

This paper examines the feasibility of assessing stream flow on the basis of a reconnaissance survey of streams from small catchments of less than 100 sq. miles. Large sums of money are expended on numerous small works, such as road bridges and culverts, where time and money are not available for collection of long term stream flow data. Bankfull level was identified for streams in New South Wales on the basis of channel monopoly and vegetation. The data collected showed bankfull frequency to be a promising index for estimation of discharge-frequency relationships. A fixed frequency technique appears best suited for extrapolating from the base flood frequency. This method does not require rainfall observations. It represents an integration of all catchment characteristics. (Crouse-Arizona)

PHYSICAL INFLUENCES ON FLOW SERIAL CORRELATION,
Washington Univ., Seattle. Dept. of Civil Engineering.
William J. Stolte, and Thomas H. Campbell.
Technical Report No 27. Available from the Clearinghouse as PB-187271, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Washington Water Research Center, June 1969. 97 p, 27 fig, 4 tab, 34 ref. OWRR Project A-020-WASH.

Descriptors: *Runoff, Hydrology, Streamflow, Synthesis, Washington, Contours, Water storage, Snowmelt.

The effects of basin geometry and water storage capacity, rainfall, snow accumulation, and snowmelt on the lag-one monthly and annual serial correlation in the streamflow of Western Washington are examined by means of contouring and multivariate analyses. It is found that rainfall, snow accumulation, and snowmelt strongly influence the variation in the monthly flow serial correlation from basin to basin while the corresponding influence of basin geometry and water storage capacity is quite weak. The effect of these factors on the annual flow serial correlation is indirect and difficult to explain.

STATISTICAL ANALYSIS OF MEANDERING RIVER GEOMETRY,
Purdue Univ., Lafayette, Ind.
T. P. Chang, and G. H. Toebes.
Available from the Clearinghouse as PB-187 273, $3.00 in paper copy, $0.65 in microfiche. Purdue University Water Resources Research Center Technical Report No 7, June 1969. 162 p, 16 tab, 46 fig, 56 ref. OWRR Project A-003-IND.

Descriptors: *Meanders, *Channel morphology, Flood plains, Geomorphology, Rivers, Stream erosion, River beds, Thalweg, Profiles, Channel discharge, Bank stability, Channel shape, Channel depth, Channel width.
Identifiers: Wabash River, White River.

An investigation of the geometry of two natural meandering rivers, the Wabash River and the White River in Indiana, is described. Local curvature series were used to describe the meandering intensity. The power spectra of local curvature series were adopted to characterize the meander wavelengths. Relationships between absolute curvature, width, thalweg depth and cross sectional area have been suggested by their cross-correlation functions and cross-spectra. Two groups of factors: (1) geology and soil; (2) flow rate and channel

slope were postulated to be major factors to affect the meander planform for the rivers studied. A program to analyze the non-stationary data has been developed and applied to the curvature series. It appears to provide an objective way to describe details of a meandering river.

GROUND-WATER CONDITIONS IN McMULLEN VALLEY, MARICOPA, YUMA AND YAVAPAI COUNTIES, ARIZONA,
Geological Survey, Phoenix, Ariz.
P. C. Briggs.
Ariz State Land Dep Water-Resources Rep No 40, July 1969. 31 p, 9 fig, 4 tab, 2 ref, append.

Descriptors: *Groundwater, *Arizona, *Water level fluctuations, *Aquifers, Alluvium, Water yield, Water supply, Water quality, Irrigation water, Hydrologic data, Data collections.
Identifiers: McMullen Valley (Ariz).

Pumping of groundwater in McMullen Valley, Arizona is concentrated mainly in two areas - the Salome-Wenden area, which is near the outlet of the valley, and the Aguila area, which is about 25 miles farther upstream. In the Salome-Wenden area about 8,000 acre-ft of groundwater was withdrawn in 1957 and about 40,000 acre-ft was withdrawn in 1965; in the Aguila area 13,000 acre-ft was withdrawn in 1957 and 50,000 acre-ft was withdrawn in 1965. The withdrawal has caused water-level declines, changes in the flow pattern, and a decrease in the amount of groundwater in storage. Near Aguila, the water-level decline was more than 70 ft, and northeast of the Wenden area the decline was as much as 60 ft in the 7-year period 1958-65. In an area in Harrisburg Valley southeast of Salome there was no net change in water level in the 7-year period. Rises in water level, which offset declines, probably were caused by recharge from the surface water ponded behind a flood-control dam. In general, the ground water in McMullen Valley is well suited for irrigation because of the low dissolved-solids content, but in places the different dissolved constituents limit its use, depending on the soil type and crop being grown. The fluoride content of the water, however, is from 2 to 10 times the maximum recommended for drinking water. (Knapp-USGS)

HYDROLOGY OF SOUTH BONAIRE, N. A. - A ROCK SELECTIVE DOLOMITIZATION MODEL,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Geology.
R. C. Murray.
J Sediment Petrol, Vol 39, No 3, p 1007-1013, Sept 1969. 7 p, 6 fig, 9 ref.

Descriptors: *Diagenesis, *Limestones, *Dolomite, Hydrogeology, Aquifers, Evaporation, Groundwater movement, Water circulation, Karst, Chemical reductions, Water chemistry, Sea water.
Identifiers: *Dolomitization, *Netherlands, Antilles.

Study of the hydrology of the south end of the island of Bonaire, Netherlands Antilles, indicates that flow of fresh sea water onto land takes place through permeability conduits in the underlying rock and emerges as numerous springs. Reflux of some heavy brine is probably continuously taking place because of gravitational instability. In addition, evidence suggest a major annual reflux event in early summer that causes a significant loss of heavy brine. This annual event is controlled by the total pressure of the brine exerted at the level of an impermeable clay layer within the recent sediments being greater than the pressure exerted by the sea water at equivalent level. This annual return flow of brine moves through some of the same permeability conduits that supply fresh water through most of the year. Dolomite formed by such a hydrology should be confined to the permeability paths underneath an evaporite sediment in older rocks. This pattern of rock-selective or permeability-controlled dolomitization may be common in ancient rocks. (Knapp-USGS)

LIMESTONE HYDROLOGY IN THE UPPER STONES RIVER BASIN, CENTRAL TENNESSEE,
Geological Survey, Washington, D.C.
G. K. Moore, C. R. Burchett, and R. H. Bingham.
Tenn Dep Conserv, Div of Water Rep, 1969. 58 p, 29 fig, 3 plate, 2 tab, 32 ref.

Descriptors: *Groundwater, *Karst, *Carbonate rocks, *Tennessee, Water wells, Groundwater movement, Water supply, Water yield, Permeability, Porosity, Hydrologic data, Data collections, Hydrogeology, Water levels, Springs, Recharge.
Identifiers: Stones River basin (Tenn).

The available evidence indicates that the solution cavities of the limestones of the Upper Stones River Basin, Tennessee range from a fraction of an inch to several inches high, from several tens of feet to several hundred feet wide, and from a fraction of a mile to several miles long. The hydrographs of 4 observation wells indicate that recharge is limited to specific areas, and that solution cavities function only as pipelines to carry water from the recharge area to the discharge area. Nearly all recharge and discharge occurs through open joints. Sinkholes are important recharge centers. Groundwater moves generally from the uplands to the streams. A map of groundwater levels in the basin does not reflect hydraulic gradients within individual solution cavities except across short distances. Instead, the map shows the water-level differences between essentially horizontal solution cavities at various depths. Some solution-cavity segments are joint controlled. Also, slightly higher well yields are obtained where thick soils are developed along joints. Joint direction and soil thickness should be considered in selecting test-well locations. (Knapp-USGS)

HYDROLOGY OF CARBONATE ROCK TERRANES, A REVIEW-WITH SPECIAL REFERENCE TO THE UNITED STATES (PART 1),
Geological Survey, Washington, D.C.; and Geological Survey, Raleigh, N.C.
V. T. Stringfield, and H. E. LeGrand.
J Hydrol, Vol 8, No 3, p 349-376, July 1969. 28 p, 4 fig.

Descriptors: *Hydrogeology, *Carbonate rocks, *Karst, *Reviews, Caves, Drainage effects, Groundwater movement, Limestones, Subsurface drainage, Topography, Geology.
Identifiers: Karst hydrology.

Limestone and other carbonate rocks are characterized by many unusual features and extreme conditions, either involving the hydrologic system within them or wrought by hydrologic conditions on them or through them. The need for knowing the specific geologic and hydrologic conditions at various places in limestone terranes, as well as the variations in hydrologic conditions with changing conditions and time, has resulted in many published reports on local areas and on special topical problems of limestone hydrology. Many of these reports have been used to advantage. The concept that secondary permeability is developed by circulation of water through openings with the accompanying enlargement of these openings by solution is now universally accepted in limestone terranes. Emphasis is placed on the hydrogeologic framework, or structural setting, in relation to the ease or difficulty of water to move from a source of recharge, through a part of the limestone, to a discharge area. Parts of the limestone favored by circulating ground water tend to develop solution openings, commonly in the upper part of the zone of saturation; as base level is lowered (sea level or perennial stream level), the related water table lowers in the limestone leaving air-filled caverns above the present zone of saturation in sinkhole areas. Reconstruction of the geologic and hydrologic history of a limestone area aids in determining the extent of development and the positions of fossil and present permeability. References are made to the hydrology of many limestone regions, especially those of the United States. (Knapp-USGS)

RESULTS OF SUBSURFACE EXPLORATION IN THE MID-ISLAND AREA OF WESTERN SUFFOLK COUNTY, LONG ISLAND, NEW YORK,
Geological Survey, Albany, N.Y.
Julian Soren.
Geol Surv Open-file Rep, July 1969. 90 p, 4 fig, 6 plate, 2 tab, 19 ref, append.

Descriptors: *Water resources, *Water supply, *Groundwater, *Surveys, *New York, Aquifers, Water levels, Water quality, Hydrologic data, Data collections, Hydrogeology, Water wells, Water level fluctuations, Hydrographs, Glacial drift.
Identifiers: Long Island (NY).

The mid-island area of western Suffolk County, Long Island, N.Y., is an area of about 140 sq mi which extends from the western border of the county to Lake Ronkonkoma. A program of test drilling and data collection was undertaken in 1963 to obtain information on the local geohydrology. Results of the work show that: the area is underlain by thick unconsolidated aquifers of moderate to high permeability; the water in the aquifers is of good quality for domestic and industrial uses; and sufficient groundwater of good quality should be available for at least several decades. Groundwater pumping in the area increased greatly to maintain adequate supplies for the growing population. In 1968, about 33 mgd was pumped, which was an increase of about 2.5 times the average pumpage in 1958. From 1903 to 1968, the water-table decline ranged from about 5 ft, in the eastern part of the area, to as much as about 40 ft, in the western part. The decline of the water table reflects the loss of about 30 billion gallons of groundwater in storage. An additional loss of groundwater in storage is anticipated as a result of increased pumpage and increased urbanization. (Knapp-USGS)

GEOLOGY OF THE REGOLITH AQUIFERS OF THE NISHNABOTNA BASIN,
Iowa State Univ., Ames. Dept. of Earth Sciences.
Lyle V. A. Sendlein, Donald E. Henkel, and Keith Hussey.
Iowa State Univ Water Resources Res Inst Proj Completion Rep, June 30, 1968. 29p, 6 fig, 42 ref. OWRR Proj No A-012-IA.

Descriptors: *Hydrogeology, *Hydrologic budget, *Aquifers, *Glacial drift, *Iowa, Groundwater movement, Mapping, Surveys, Geology, Sands, Gravels.

Identifiers: Nishnabotna Basin, Buried valleys.

In the analysis of the water budget of basins the one variable generally assumed to be constant is groundwater inflow and outflow. An investigation was made to evaluate the validity of this assumption in a glacial terrain underlain by a bedrock valley system. With the integrated use of geologic and geophysical data a major bedrock valley, the northern extension of a major buried valley system of Missouri was mapped. Sand and gravel deposits were found in segments of the buried valley and as a basal drift unit on the bedrock upland surface. Bedrock which subcrops in the basin is Pennsylvanian in the southern half both on the upland and in the buried valley. In the northern portion it is Cretaceous on the upland and Pennsylvanian in the valleys. The application of the seismic refraction electrical resistivity methods proved valuable and economical. The full report is available through the Iowa State Water Resources Research Institute, Ames, Iowa. (Knapp-USGS)

GROUNDWATER RESOURCES OF MONMOUTH COUNTY, NEW JERSEY,
Geological Survey, Trenton, N.J.
Leo A. Jablonski.
N J Div Water Policy and Supply Spec Rep No 23, 1968. 117 p, 27 fig, 5 tab, 32 ref.

Descriptors: *Water resources, *Groundwater, *New Jersey, Surveys, Data collections, Hydrologic data, Aquifers, Water wells, Water yield, Water quality, Saline water intrusion, Hydrographs, Hydrogeology, Duration curves.
Identifiers: Monmouth County (NJ).

Monmouth County includes an area of 538 sq mi in east-central New Jersey. The climate is characteristized by moderate temperature, moderate humidity, and moderate precipitation. Groundwater constituted about 50% of the total water use in 1958. The daily withdrawal of groundwater was at an average rate of 21.6 mgd in 1958 and about 32 mgd in 1965. The water demand is expected to increase to about 133 mgd by the year 2000. An anlaysis of streamflow records for the period 1932 to 1950 suggests that, excluding the Raritan and Magothy Formations, the major aquifers that occur under water-table conditions in the county discharge an average of about 178 mgd to streams. Because salt water has been found in the lower parts of these formations in Ocean County, further development should proceed watchfully to assure that salt water does not threaten existing supplies. Aquifers in the Raritan and Magothy Formations and the Englishtown Formation supplied 76% of the groundwater used in 1958. These aquifers, in conjunction with the Wenonah Formation and Mount Laurel Sand of Late Cretaceous age, are capable of providing relatively large yields to wells. The average yield of 63 large-diameter wells tapping these aquifers is 580 gpm, at depths ranging from 100 to 1,140 ft. In general, the concentrations of chemical constituents in water from the aquifers would not restrict the use of the water for most purposes. High concentrations of iron do occur and require treatment. The concentrations of dissolved solids in 39 of 41 samples were 160 ppm or less. (Knapp-USGS)

GROUNDWATER RECONNAISSANCE IN THE BURNT RIVER VALLEY AREA, OREGON,
Geological Survey, Washington, D.C.
Don Price.
Geol Surv Water-Supply Pap 1839-I, 1967. 27 p, 7 fig, 1 plate, 3 tab, 14 ref.

Descriptors: *Water resources, *Groundwater, *Surveys, *Oregon, Water wells, Water yield, Water quality, Data collections, Hydrologic data, Hydrogeology, Water levels, Aquifers, Gravels, Basalts.
Identifiers: *Burnt River Valley (Oregon).

The Burnt River valley area in southern Baker and northern Malheur Counties, Oreg., is underlain by rocks that range in age from pre-Tertiary to Quarternary. The pre-Tertiary rocks and most of the Tertiary rocks that underlie the map area have relatively low permeability and yield water slowly to wells and springs. Potentially productive aquifers occur in the Quaternary alluvium in the Burnt River and Willow Creek valleys, in the fluviolacustrine deposits, and in basaltic lava flows that extend beneath the valley floors. Fluviolacustrine deposits yield only small to moderate quantities of water, generally less than 50 gpm, to wells, but they contain gravel lenses locally which could yield moderate to large quantities of water. Basaltic rocks that are intercalated with and extend beneath the fluviolacustrine deposits near Huntington and in Willow Creek valley yield moderate to large quantities of water (as much as 1,000 gpm) to wells; however, those rocks are of limited extent in the study area and in most places appear to lie above the regional water table. The groundwater is chemically suitable for irrigation of most crops that can be grown under the climatic conditions of the area. However, samples collected from 2 wells that tap the fluviolacustrine deposits, one near Durkee and the other near Bridgeport, were classified as having very high sodium and a high salinity hazard; those samples also contained concentrations of boron that could be toxic to some plants. FLUID DYNAMICS OF MULTIPHASE SYSTEMS,
Illinois Univ., Urbana. Dept. of Mechanical Engineering.
S. L. Soo.
Waltham, Mass, Blaisdell Publishing Co, 1967. 524 p, 206 fig, 8 tab, 886 ref.

Descriptors: *Fluid mechanics, *Suspension, Flow, Porous media, Turbulent flow, Laminar flow, Dynamics, Dispersion, Flocculation, Closed conduit flow, Compressible flow, Flow characteristics, Hydrodynamics, Sediment transport, Suspended load, Deposition (Sediments).
Identifiers: *Multiphase flow.

Basic concepts of multiphase fluid dynamics are discussed in a textbook intended for students in advanced graduate courses and for laboratory reseachers. The primary concern of the discussion is with particulate clouds, but flow in porous media, turbulent flow, sedimentation, and suspensions are also comprehensively presented. Topics include rigid particle transport, deformable particle transport, pipe flow of a suspension, particle-cloud transport properties, basic equations of multiphase systems, gas dynamics of suspensions, hydrodynamics of suspensions, sedimentation, fluidization, packed beds, and electrodynamics. A comprehensive bibliography and review of the literature of ideas and methods in fluid mechanics is included. (Knapp-USGS)

AVAILABILITY OF GROUND WATER IN YORK COUNTY, NEBRASKA,
Geological Survey, Washington, D.C.
C. F. Keech, V. H. Dreeszen, and P. A. Emery.
Geol Surv Water-Supply Pap 1839-F, p F1-F17, 1967. 17 p, 3 fig, 2 plate, 1 tab, 11 ref.

Descriptors: *Water resources, *Groundwater, *Surveys, *Nebraska, Aquifers, Water yield, Water wells, Hydrogeology, Hydrologic data, Data collections, Water level fluctuations, Water quality, Water supply, Irrigation water.
Identifiers: York County (Nebr).

York County, an area of 575 sq mi, is situated on an upland plain in southeast Nebraska. Although tributaries of the Big Blue River have eroded valleys into this plain, much of the original surface is still intact and is characterized by broad shallow undrained depressions. More than 111,000 acres of cropland was irrigated in 1964 with water pumped from 1,240 wells. The upland plain is underlain to depths of 100-450 ft by unconsolidated deposits of Quaternary age. The unconsolidated Quaternary deposits mantle the eroded surface of marine strata of Cretaceous age. The lower unconsolidated rocks of Quaternary age are saturated and constitute a highly productive aquifer throughout much of the county. Replenishment to this aquifer, derived principally from precipitation, averages about 1.5 inches per year. As the quantity of ground water pumped per year greatly exceeds the average annual quantity of recharge, most of the water used for irrigation is from storage. Consequently, water levels have been trending downward. A comparison of 1964 water levels in wells with water levels measured in 1953 shows that the water table declined more than 10 ft. beneath 42 sq mi. The ground water is of the calcium bicarbonate type, and, though hard, is chemically suitable for irrigation use on most soils in the county. (Knapp-USGS)

GROUNDWATER RESOURCES OF THE PASCAGOULA RIVER BASIN, MISSISSIPPI AND ALABAMA,
Geological Survey, Washington, D.C.
Roy Newcome, Jr.
Geol Surv Water-Supply Pap 1839-K, p K1-K36, 1967. 36 p, 12 fig, 4 tab, 17 ref.

Descriptors: *Water resources, *Groundwater, *Mississippi, *Alabama, Aquifers, Water wells, Artesian wells, Water yield, Water quality, Hydrogeology, Water supply, Water levels, Hydrologic data, Data collections.
Identifiers: Pascagoula River Basin (Miss-Ala).

Abundant groundwater resources underlie the Pascagoula River basin, Mississippi. These resources have been developed intensively only in Hattiesburg, Laurel, Meridian, and Pascagoula. The fresh-water-bearing section is 300 to 3,500 ft thick and is composed chiefly of sand and clay of Eocene to Recent age. Major rock units represented are the Wilcox, Claiborne, Jackson, and Vicksburg Groups and formations of Miocene and Pliocene ages. Aquifers in the Claiborne Group provide water for all purposes in the northern third of the basin. The Claiborne is underlain by the potentially important but virtually untapped Wilcox Group. Miocene aquifers are the main source of water supplies in the southern half of the basin, but Pliocene aquifers furnish most supplies in the Jackson County area at the basin's southern extremity. Groundwater levels are within 50 ft of the surface in most places, and flowing wells are common in the valleys and near the coast. Water-level declines due to pumping have become serious problems only in a few localities of heavy withdrawal. Although few wells in the basin yield more than 500 gpm, yields of 1,000 gpm or more could be reasonably expected from efficiently constructed wells almost anywhere in the region. The groundwater is of good to excellent quality. Saltwater encroachment is a potential problem in the coastal area, but little increase in salinity has been observed in monitor wells in the period 1960-65.

Saline-water resources are available for development at considerable depth in most of the region. (Knapp-USGS)

AN INEXPENSIVE METHOD FOR DETERMINING THE DIRECTION OF NATURAL FLOW OF GROUNDWATER,
Irrigation Research Inst., Lahore (Pakistan).
Mohammad Saleem.
J Hydrol, Vol 9, No 1, p 73-89, Sept 1969. 17 p, 5 fig, 10 ref, append.

Descriptors: *Groundwater movement, *Tracers, Tracking techniques, Monitoring, Water wells, Instrumentation, Mathematical studies, Drainage, Percolation.
Identifiers: Groundwater tracers.

Groundwater flow is a vector quantity, the magnitude of which can be easily determined in situ by measuring the rate of dilution of a tracer in a borehole with perforated screen, called the 'Master-well'. Knowing the magnitude, the direction then can easily be evaluated by introducing another vector quantity of known magnitude and direction and then finally measuring the magnitude of the resultant flow. This new vector can be introduced by pumping a tube-well at some convenient distance from the master-well. All flow measurements are carried out in the same master-well. If the tracer used is not radioactive, the dilution rates are computed by measuring the electrical conductivities using low voltage and low frequency A.C. (Knapp-USGS)

PORE STUDIES OF HIGHLY INDURATED APPALACHIAN ROCKS,
Virginia Univ., Charlottesville. Dept. of Geology; Virginia Highway Research Council, Charlottesville; and Cities Service Oil Co., Tulsa, Okla.
W. Cullen Sherwood, and Jinn Huie Huang.
The Amer Ass Petrol Geol Bull, Vol 53, No 10, Part 1, p 2161-2170, Oct 1969. 10 p, 12 fig, 2 tab, 22 ref.

Descriptors: *Porosity, *Carbonate rocks, *Metamorphic rocks, *Appalachian Mountain Region, Fractures (Geology), Permeability, Pores, Rock properties, Void ratio, Voids, Groundwater movement.
Identifiers: Pore geometry, Porosimetry.

The porosity and pore-size distribution of highly indurated carbonate rocks and igneous and metamorphic silicate rocks from the Valley and Ridge and Piedmont provinces in Virginia were studied by mercury-porosimetry, specific-gravity, and petrographic techniques. Porosity values range from 0.19 to 3.66%, and mean pore diameters from 0.010 to 0.866 microns. Fundamental differences in the character of pores were noted between the igneous and metamorphic rocks and the carbonate rocks. Pores in the individual crystalline rocks are concentrated predominantly at 2 to 4 different sizes, whereas those in the carbonate rocks generally are of one size. Also the mean pore diameters in the carbonate rocks are generally smaller; the pores are of a lesser size range than those in the igneous and metamorphic rocks, but the porosity of the carbonate rocks generally is higher and shows a greater variation. The low porosity and small pores measured in the dolomitic rocks from Virginia appear to indicate that most dolomitization preceded the strong compactive forces of Appalachian folding. (Knapp-USGS)

WATER BUDGET STUDIES IN KARST AQUIFERS,
McMaster Univ., Hamilton (Ontario). Dept. of Geography; and Waterloo Univ. (Ontario). Dept. of Mechanical Engineering.
M. C. Brown, T. L. Wigley, and D. C. Ford.
J Hydrol, Vol 9, No 1, p 113-116, Sept 1969. 4 p, 2 fig, 16 ref.

Descriptors: *Tracers, *Karst, *Aquifers, *Limestones, Groundwater movement, Dye releases, Tracking techniques, Springs, Streamflow, Sinks, Subsurface drainage, Instrumentation, Hydrologic budget.
Identifiers: Stream gaging, Springflow gaging.

The use of tracers in limestone hydrology studies is discussed and an example of the use of Rhodamine-WT in a study of a karst aquifer in British Columbia is given. Rhodamine WT is not easily adsorbed by clays and other minerals, and few substances interfere at its emission wavelength. In the field test, 1320 cc of dye was injected into a stream above a sink. Streamflow was calculated from dilution measurements above the sink and below a spring. The dye recovery at the spring was 98%, proving that the sink and spring are directly connected. The same technique can be used in more complex cases. (Knapp-USGS)

GROUNDWATER RESOURCES OF THE ERIE-NIAGARA BASIN, NEW YORK,
Geological Survey, Albany, N.Y.
A. M. LaSala, Jr.
NY State Water Resources Comm Basin Planning Rep ENB-3, 1968. 114 p, 20 fig, 5 plate, 9 tab, 29 ref.

Descriptors: *Water resources, *Groundwater, *Surveys, *New York, Lake Erie, Hydrologic data, Data collections, Water wells, Aquifers, Water levels, Water quality, Water pollution, Groundwater movement, Induced infiltration, Water supply, Duration curves, Hydrographs.
Identifiers: Erie-Niagara Basin (NY).

The Erie-Niagara basin, New York, borders Lake Erie and the Niagara River and includes the principal part of their drainage basin in New York. The principal water-bearing formations in the area are glacial sand and gravel deposits; the Camillus Shale, which contains interbedded gypsum; a limestone aquifer unit consisting of the Onondaga Limestone, Akron Dolomite, and Bertie Limestone; and the Lockport Dolomite. A number of thick and permeable sand and gravel deposits lie in the valleys of the upland region and will yield supplies of 500 to 1,400 gpm to individual wells that are properly constructed. Average annual recharge to the sand and gravel deposits in the upland region ranges from about half a million to 4 mgd/sq mi. As the larger deposits are each several square miles in extent, the potential for development is large. To this potential should be added infiltration from streams that could be induced by pumping large quantities of groundwater. The quality of groundwater in the Appalachian Uplands is marked by a high hardness but generally not by other unfavorable characteristics. Shallow groundwater in carbonate rocks and sand and gravel deposits locally has been polluted by septic tank effluent. (Knapp-USGS)

2G. Water in Soils

FORCES ACTING UPON THE SOLID PHASE OF A POROUS MEDIUM,
Agricultural Research Service, Madison, Wis.
Petrus A. C. Raats.
J Appl Math and Phys, Vol 19, No 4, p 606-613, July 1968. 8 p, 10 ref.

Descriptors: *Porous media, *Flow, *Stress analysis, *Mathematical studies, Groundwater movement, Soil water movement, Darcy's law, Soil physical properties, Soil physics, Hydraulics.
Identifiers: Continuum theory of mixtures.

The forces acting on the solids phase of porous media in which fluid is flowing are analyzed mathematically using the continuum theory of mixtures. Porous media consisting of a solid phase and any number of fluid phases are considered. Some special cases discussed are Darcy's law, seepage force, and effective stress. (Knapp-USGS)

PHYSICAL PROPERTIES OF PEATS AS RELATED TO DEGREE OF DECOMPOSITION,
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
D. H. Boelter.
Soil Sci Soc Amer Proc 33 (4) July-Aug 1969, p 606-609.

Descriptors: *Peat, *Organic soils, *Soil density, *Soil water, *Hydraulic conductivity, Bogs, Minnesota, Soil physical property, Soil moisture, Soil water movement, Hydrologic properties, Saturated flow, Retention, Porosity.
Identifiers: *Fiber content, Degree of decomposition, *Histosols, Sapric peat, Hemic peat, Fibric peat.

Important physical characteristics, such as water retention, water yield coefficient, and hydraulic conductivity, vary greatly for representative northern Minnesota peat materials. The differences are related to the degree of decomposition, which largely determines the porosity and pore size distribution. Fiber content (>0.1 mm) and bulk density are properties often measured to indicate the degree of decomposition of peat materials and are criteria used to distinguish fibric, hemic and sapric peat types. Regression analyses showed a curvilinear relationship of water contents at saturation, 5 mbar, 0.1 bar, and 15 bar suctions, to fiber content (>0.1 mm) and bulk density with coefficients of multiple determination (R sq) ranging

from .66 to .88. Regression analyses of the logarithm of hydraulic conductivity on fiber content (>0.1 mm) and bulk density indicate a linear relationship (r sq= .54), although not as great due to the variability of hydraulic conductivity. Thus the classification of peat materials and organic soils based primarily on degreee of decomposition as measured by fiber content and vulk density would relate significant information about their physical characteristics.

2H. Lakes

AN ORIENTATION STUDY OF THE URANIUM DISTRIBUTION IN LAKE WATERS, BEAVERLODGE DISTRICT, SASKATCHEWAN,
Eldorado Mining and Refining Ltd., Montreal (Quebec).
John A. MacDonald.
Quart Colo School of Mines, Int Geochem Explor Symp, Vol 64, No 1, p 357-376, Jan 1969. 20 p, 9 fig, 2 tab, 15 ref.

Descriptors: *Uranium radioisotopes, *Lakes, *Surface waters, Chemical analysis, Bicarbonates, Conductivity, Seasonal, Spring, Temperature, Solubility, Geology, Topography, Mapping, Analytical techniques, Drainage, Statistical methods.
Identifiers: *Canada, *Saskatchewan, Geochemical prospecting.

Surface waters of the Beaverlodge uranium district of Saskatchewan were investigated for their mineral content. With the exception of the spring breakup period, there is no significant variation in the uranium content of lake water which can be attributed to seasonal temperature changes or precipitation. Correlation studies show an increase in specific conductance of lake water in the vicinity of mineralized areas. Lake water assays, in general, show that the Beaverlodge uranium district is delineated by an analytical plateau of 0.9 ppb U, approximately twice the regional background value of 0.4 ppb. Numerous high concentrations occurring within the background plateau levels define zones of pitchblende mineralization. (Gabriel-USGS)

URANIUM IN LAKE WATER FROM THE KAIPOKOK REGION, LABRADOR,
British Newfoundland Exploration Ltd.
W. T. Meyer.
Quart Colo School of Mines, Int Geochem Explor Symp, Vol 64, No 1, p 377-394, Jan 1969. 18 p, 13 fig, 3 ref.

Descriptors: *Lakes, *Water chemistry, *Uranium radioisotopes, *Trace elements, *Arctic, Exploration, Mapping, Glaciation, Ice, Statistical methods, Geophysics, Gamma rays, Streamflow, Sampling, Organic matter, Temperature, Carbonates.
Identifiers: *Canada, Labrador, *Geochemical prospecting.

The shallow lakes of glacial origin located in the Kaipokok region of Labrador were investigated for their uranium content by using a gamma-ray spectrometer flown by fixed-wing and helicopter systems and the U.S. Geological Survey technique based on the evaporation of 10-milliliter samples of lake waters. Lake water surveys for uranium are a significant aid to airborne exploration in this region of Labrador. Ideally, sampling should take place in the late fall and attention should be given to the effect of the biochemical cycle of uranium and especially to the contribution of uranium by swamp erosion. Because of the low cost of lake water surveys, this method could be used as a preliminary step before selecting areas to be flown using more expensive geophysical surveys. (Gabriel-USGS)

WATER-RELATED RESEARCH FOR THE GREAT LAKES REGION,
Michigan Univ., Ann Arbor. Dept. of Conservation; and Michigan Univ., Ann Arbor. Inst. of Science and Technology.
Spenser W. Havlick, and James T. Wilson.
EOS, Trans Amer Geophys Union, Vol 50, No 8, p 492-494, Aug 1969. 3 p.

Descriptors: *Research and development, *Water management (Applied), *Great Lakes, *Water resources development, Water quality, Systems analysis, Model studies, Economics, Data collections, Data storage and retrieval, Regional analysis, Data processing.
Identifiers: *Great Lakes region.

Coordinated study of water resources management in the Great Lakes by using systems analysis is recommended. The Great Lakes Basin Commission is suggested as a possible coordinating mechanism for water resources research between universities, research oriented organizations, and Federal and State agencies. A regional comprehensive model for the Great Lakes is not feasible at this time. Development of subsystem models is recommended for each geographic area of the Great Lakes region. The main areas of proposed research are: (1) water quantity and lake level models; (2) water quality models; and (3) economic growth models. There is also need for coordination of information retrieval, data storage, and data collection. An appraisal of the water management decisions is also recommended. (Carstea-USGS)

OBSERVATIONS ON DEEPWATER PLANTS IN LAKE TAHOE, CALIFORNIA AND NEVADA,
Nevada Fish and Game Dept., Reno; and California State Dept. of Fish and Game, Sacramento. Inland Fisheries Branch.
Ted C. Frantz, and Almo J. Cordone.
Ecology, Vol 48, No 5, p 709-714, 1967. 3 fig, 3 tab, 17 ref.

Descriptors: *Deep water, *Lakes, *Plants, *California, *Nevada, Depth, Algae, Mosses, Chara, Fish, Limnology, Lake trout, Crayfish, Stoneflies, Snails, Ecology, Eutrophication, Domestic wastes, Shallow water, Chlorophyta, Chrysophyta, Cyanophyta, Sampling, Density, Light, Mud, Silts, Sands, Gravels, Sediments, Water pollution sources.
Identifiers: *Lake Tahoe (Calif-Nev), Hydrophytes, Liverworts, Morphometry, Pacifastacus leniusculus, Anacharis canadensis, Myriophyllum, Potamogeton crispus, Microspora wittrockii, Spirogyra, Xanthophyceae, Myxophyceae, Salvelinus namaycush, Substrate type.

Aquatic studies of Lake Tahoe have disclosed a remarkable plant zonation. With surface area not unusually large, it has maximum depth of 1645 feet, mean depth of 1027 feet. Deepwater macroscopic hydrophytes in Lake Tahoe, found to depths of 500 feet, consisted of algae, mosses, and liverworts. Most were concentrated at depths of 200-350 feet. Only Chara occasionally invades areas shallow as 20 feet; other deepwater hydrophytes are restricted to depths below 50 feet. The list of identified species, probably incomplete, includes six algae, ten mosses, and two liverworts. Although light transmission probably controls maximum depth of plant occurrence, factors limiting inshore distribution are less clear. Substrate type at lake's south end seems to control shoreward extension of plants. These deepwater plant beds are not only unusual scientific interest but appear important in the life history of Tahoe's major game fish, the lake trout, whose maximum concentration coincides with these plant zones; plants apparently provide shelter for crayfish, nongame fishes, and small lake trout. Longterm research on ecology of these deepwater hydrophyte communities is needed. Lake Tahoe is threatened with eutrophication from domestic wastes. (Jones-Wisconsin)

VERTICAL DISTRIBUTION OF PHOSPHORUS IN LINSLEY POND MUD,
Duke Univ., Durham N.C. Dept. of Zoology.
D. A. Livingstone, and J. C. Boykin.
Limnology and Oceanography, Vol 7, p 57-62, Jan 1962. 4 fig, 20 ref.

Descriptors: *Phosphorus, *Sorption, *Lake soils, Cycling nutrients, Bacteria, Lakes, Sediments, Ion exchange, Iron compounds.
Identifiers: *Linsley Pond (Conn), *Sediments (Mineral fraction), Seston, Einsele sorption isotherm, Diagenetic changes, Gyttja, Aluminum compounds, Hydroxyphosphates, Specific conductance.

Nitric-perchloric acid digestion disclosed large quantities of phosphorus (P) in the basal third of the sediment consisting largely of mineral particles. The low solubility of sedimentary phosphates, as shown by water and hydrochloric acid (0.1 Normal) extractions, suggested existence of sorption reactions of the element with the mineral fraction of the lake mud. Under conditions in lake soils, fixation of P in the form of apatite or iron and aluminum hydroxyphosphates is not feasible and the causes for the conversion of P into slowly soluble form was not disclosed. The ratio of bound P to inorganic material of different texture suggested a possibility of sorption on the surface of mineral particles. Regardless of the nature of reactions, the productivity of the lake is inversely proportional to the fixation capacity of the sediment and directly proportional to the total ionic activity of the water. 2I. Water in Plants

A LIMNOLOGICAL STUDY OF A TENNESSEE COLD SPRINGBROOK,
Tennessee Rechnological Univ., Cookeville. Dept. of Biology.
Michele S. Stern, and Daniel H. Stern.
The Amer Midland Natur, Vol 82, No 1, p 62-82, July 1969. 21 p, 3 fig, 4 tab, 52 ref.

Descriptors: *Limnology, *Springs, *Tennessee, Invertebrates, Seasonal, Forests, Animal population, Algae, Insects, Analytical techniques, Chemical analysis, Rainfall, Geology, Currents (Water), Calcium, Carbon, Nitrogen, Silica, Water temperature, Biota.
Identifiers: Springbrook limnology, Putnam County (Tenn).

A one-year limnological investigation was conducted on a small springbrook in Putman County, Tennessee to evaluate the components of invertebrate biocoenoses, to record the population fluxes and factors affecting abundance, and to determine interaction between members of the communities. Study of 59 taxa of invertebrates shows their greatest abundance in February and lowest in July. It is assumed that the surrounding

deciduous forest has the greatest effect on species composition and abundance of the fauna of the springbrook. (Gabriel-USGS)
W70-00672

THE FOREST VEGETATION OF THE BRULE RIVER BASIN, WISCONSIN, TRIBUTARY TO LAKE SUPERIOR,
Wisconsin State Univ., Superior.
Donald W. Davidson.
Paper presented before Minnesota Academy of Science, University of Minnesota, Duluth, May 3, 1969. OWRR Project A-023-WIS.

Descriptors: *Ecology, *Forest, *Vegetation, *Trees, Conservation.
Identifiers: *Northern Wisconsin, *Brule River basin, *Saplings.

Under contract with the Water Resources Center, University of Wisconsin, Madison, and as part of an interdisciplinary study of the ecology of the Brule River Basin, northern Wisconsin, during the summer of 1968 a survey was made of 20 stands of relatively undisturbed forest vegetation, distributed uniformly over the Brule River Basin. In each stand, 20 points were sampled by the Point-centered Quarter Method. Stems 3.96 inches diameter at breast height and over were classed as trees - those less than 3.95 inches d.b.h. were classed as saplings. Seventeen upland stands were sampled, and were dominated by the following leading dominant tree species: Quercus rubra, 5 stands; Populus tremuloides, 4; Populus grandidentata, 2; Pinus banksiana, 2; Abies balsamea, 2; Acer rubrum, 1; and Acer saccharum, 1. Three lowland stands were sampled, and were dominated by: Picea mariana, 1; Thuja occidentalis, 1; and Fraxinus nigra, 1. Curtis (1959 - The Vegetation of Wisconsin) describes three principal vegetation types for the area; (1) Northern forest - xeric; (2) Northern forest - lowland; (3) Boreal forest. These three types have distinct representatives in the stands studied thus far. The remaining stands are various successional stages of the other forest communities described. The vegetation of the Brule Basin has been much disturbed, particularly by cutting for lumber and pulp, so that most of the present vegetation can be said to be recovering from previous disturbance. (Dickas-Wisconsin State Univ)

2J. Erosion and Sedimentation

THE USE OF RADON-222 IN SURFACE WATERS IN GEOCHEMICAL PROSPECTING FOR URANIUM,
Geological Survey of Canada, Ottawa (Ontario).
Willy Dyck, and A. Y. Smith.
Quart Colo School of Mines, Int Geochem Explor Symp, Vol 64, No 1, p 223-236, Jan 1969. 14 p, 6 fig, 20 ref.

Descriptors: *Radioactivity techniques, *Uranium radioisotopes, Geochemistry, *Exploration, Sampling, Mine waters, Water chemistry, Surface waters, Ice, Lakes, Streams, Geology, Mapping, Statistical methods, Temperature.
Identifiers: *Canada, *Geochemical prospecting, Uranium.

As part of a geochemical prospecting study of uranium, a feasibility test of the use of radon-222 in surface waters was carried out during the latter part of 1967. The radon-222 and uranium contents of some 150 water samples from 140 sample sites in the Bancroft, Ontario, and Ottawa-Hull districts were found to vary from 0 to 2,200 pc/l and 0 to 47 ppb, respectively. A difference was observed between the radon content of lakes and ponds (0 to 262 pc/l, with some of the higher values being near uranium mining operations) and that of creeks and streams (0 to 2,200 pc/l). No such variations was noted for uranium. Although the correlation between radon and uranium values in the waters was marginal, the results indicated a gross areal correlation between radon or uranium content of surface waters and uraniferous areas. Spot measurements in winter found that radon levels in lake waters under the ice increase as expected but remain more or less constant in creeks. Uranium levels, on the other hand, remain more or less constant in lakes but decrease noticeably in creeks. The low cost and simplicity of the radon method suggest considerable potential as a preliminary reconnaissance geochemical prospecting method. (Gabriel-USGS)
W70-00421

INFLUENCE OF VARIATIONS IN SECONDARY ENVIRONMENT ON THE METAL CONTENT OF DRAINAGE SEDIMENTS,
Amax Exploration, Inc., Vancouver (British Columbia); and Imperial Coll. of Science and Technology, London (England). Dept. of Geology.
R. F. Horsnail, I. Nichol, and J. S. Webb.
Quart Colo School of Mines, Int Geochem Explor Symp, Vol 64, No 1, p 307-322, Jan 1969. 16 p, 9 fig, 1 tab, 12 ref.

Descriptors: *Geochemistry, *Drainage, *Metals, *Surface waters, Environmental effects, Chemical analysis, Spectroscopy, Trace elements, Iron, Copper, Manganese, Lead radioisotopes, Zinc radioisotopes, Geology, Glacial soils, Rainfall, Soils.
Identifiers: *England and Wales, *Geochemical prospecting.

Drainage sediment sampling of about 3000 sq mi located in England and Wales was carried out for the purpose of determining the contents of Ag, Bi, Co, Cr, Cu, Fe, Ga, Mn, Mo, Ni, Pb, Sn, Ti, and V, to be used in regional geochemical reconnaissance for useful minerals. The distribution of these metals in the samples is closely related to secondary environment, in particular to areas of high rainfall and poorly drained soils, and less related to either geology or mineralization. Such correlations are shown, to various degrees, by Mn, Fe, Co, As, Ni, and Zn. In contrast, Cr, Ga, Ti, and V show no variation with respect to surface environment. The enhancement of certain elements in the drainage sediments is caused by hydromorphic dispersion controlled by variations in the Eh and pH of the aqueous media of dispersion. (Gabriel-USGS)

QUANTITATIVE STATISTICAL ANALYSES OF COLUMBIA RIVER SEDIMENT SAMPLES,
Washington Univ., Seattle. Dept. of Oceanography.
James C. Kelley, and John T. Whetten.
J Sediment Petrol, Vol 39, No 3, p 1167-1173, Sept 1969. 7 p, 5 fig, 14 ref. Contract No AT (45-1) - 1725 AEC, Grant No GP-3591 and GA-1297 NSF.

Descriptors: *Sedimentation, *Sedimentology, *Statistical methods, *Correlation analysis, Sediments, Columbia River, Chemical analysis, Mineralogy, Particle size, Trace elements, Clays, Reservoirs.
Identifiers: Columbia River sediments, Multivariate statistical analysis.

Sediment samples from the Columbia River were analyzed for four variable sets: bulk chemistry, trace element chemistry, bulk mineralogy, and heavy mineral content. The variable sets were analyzed by discriminant function analysis and factor analysis to determine the relationships between samples in Columbia River reservoirs as reflected in their distribution in the variable space. Other statistical studies were made to determine the relationships among the variables and changes in the variables related to position in the river and grain size. The distribution of the samples in the variable space indicates changes in the sediment which can be related to changing source areas. (Knapp-USGS)

DEPOSITION OF CLASTIC SEDIMENTS BY CLAMS,
Bureau of Reclamation, Sacramento, Calif.
Nikola P. Prokopovich.
J Sediment Petrol, Vol 39, No 3, p 891-901, Sept 1969. 11 p, 11 fig, 2 tab, 10 ref.

Descriptors: *Deposition (Sediments), *Clams, *Filtration, Suspended load, Sedimentation rates, Sedimentation, Turbidity.
Identifiers: Biological deposition (Sediments).

The role of clams and other 'filter feeders' in sedimentation probably far exceeds the generally recognized accumulation of their skeletal remnants. In the course of their feeding, these organisms constantly remove suspended inorganic and organic particles from water, combine them with organic binder, and deposit them as excreta. The 'sticky' excreta (and shells) trap sand and other particles and contribute to sedimentation. The amount of clastic sediments deposited in this manner is significant, for example, in the 113-mile-long Delta-Mendota Canal in the western San Joaquin Valley, California. The sediments consist of 20-35% 'fines' which were probably precipitated as excreta, 35-50% sand, and 30% clamshells. Highly eutrophic, turbid deltaic water which is pumped into the canal supports an abundant, varied biota.Asiatic clams (Corbicula fluminea) are particularly numerous. The average number of live clams per sq ft of sediments is in the order of 1000. Laboratory pumping rate of a one-year Corbicula appears to be about 20 cc/hour. There is a general decline of clam infestation in the downstream direction, away from the Delta: In 1965-66, biomasses of Corbicula declined from about 140 (pool 1) to 25 (pool 18) tons per linear mile. Average sedimentation rates decline from about 292 cu yd/mi/yr in pools 1 through 5, to 9 cu yd/mi/yr in pools 15 through 19. Apparently smaller pumping-deposition of suspended particles by clams in downstream reaches results in correspondingly lower sedimentation rates. (Knapp-USGS)
W70-00442

ANATOMY OF A MODERN CARBONATE TIDAL-FLAT, ANDROS ISLAND, BAHAMAS,
Shell Development Co., Houston, Tex. Exploration and Production Research Div.; and Johns Hopkins Univ., Baltimore, Md. Dept. of Geology.
Eugene A. Shinn, R. Michael Lloyd, and R. N. Ginsburg.
J Sediment Petrol, Vol 39, No 3, p 1202-1228, Sept 1969. 27 p, 37 fig, 1 tab, 25 ref.

Descriptors: *Mud flats, *Tidal marshes, *Sedimentology, *Diagenesis, *Water chemistry, Geomorphology, Oxidation, Reduction (Chemical), Carbonate rocks, Limestones, Dolomite, Sedimentation, Chemical reactions, Chemical precipitation.
Identifiers: *Andros Island (Bahamas), Tidal flat.

The carbonate tidal-flat complex of northwestern Andros Island consists of 3 geomorphic areas: (1) adjacent marine belt, (2) channeled belt, and (3) marsh. The various sedimentary accumulations within these belts are controlled by tide levels. Three tidal zones are recognized: (1) subtidal zone, consisting of sediments deposited below low tide; (2) intertidal zone, consisting of sediments deposited between normal low and normal high tide; and (3) supratidal zone, consisting of sediments deposited above normal high tide but within the range of spring and storm tides. The complex may be thought of as a river delta turned 'inside out.' Most sediments that make up this delta have been transported via channel systems from the adjacent marine zone. Early diagenesis in the form of reduction, oxidation, dolomite formation, and carbonate cementation is also controlled by tide level. Strong odor of hydrogen sulfide in gray subtidal sediments suggests reduction, whereas the absence of this odor in the cream or light tan intertidal and supratidal sediments suggests oxidation. Dolomite formation and carbonate cementation are restricted to the distinctively laminated, algal-coated, and mud-cracked supratidal sediment. Stratigraphically, the channeled tidal-flat complex on northwest Andros Island is transgressive, whereas the nonchanneled flats on the southwestern coast are thought to be regressive. Alternation of transgressive and regressive tidal-flat sedimentation during subsidence or eustatic sea level rise could produce stratigraphic pinch-outs that may also become stratigraphic traps. (Knapp-USGS)

CHARACTERISTICS OF COLUMBIA RIVER SEDIMENT AND SEDIMENT TRANSPORT,
Washington Univ., Seattle. Dept. of Geology; and Washington Univ., Seattle. Dept. of Oceanology.
John T. Whetten, James C. Kelley, and Larry G. Hanson.
J Sediment Petrol, Vol 39, No 3, p 1149-1166, Sept 1969. 18 p, 10 fig, 5 tab, 34 ref. Contract No AT (45-1)-1725 AEC, Grant No GP-3591 and GA-1297 NSF.

Descriptors: *Sediments, *Columbia River, *Provenance, Suspended load, Bed load, Sediment yield, Sediment transport, Mineralogy, Erosion, Weathering, Particle size, Runoff, Scour, Reservoirs, Silting, Sand waves.
Identifiers: Columbia River sediments.

The mean particle size of sediment carried on the bed of the Columbia River increases downstream. The Snake River and other upstream tributaries contribute mostly fine sediment carried in suspension. Many downstream tributaries produce coarser sediment, which is carried largely in the bedload. Bedload is appreciable only in the lower portions of the river, and is a small percentage of the suspended load. Large migrating sand waves form the top surface of the bed. The distribution of sediment on some of the reservoir floors changes throughout the year. Sediment deposited during low discharges may be scoured from the reservoirs during periods of high discharge and transported downstream through the dams. The amount of sediment transported during a single flood may exceed that which is transported during an entire 'average' year. The mineral and chemical composition of Columbia River sediment obtained from reservoir floors suggests that the sediment particles have undergone relatively little chemical weathering. Chemically unstable mineral grains and lithic fragments abound. Quartz and elements considered relatively immobile during chemical weathering show no obvious enrichment in the sediment. The ratio of quartz to all 'unstable' constituents decreases downstream, whether the latter are taken individually or as a group. The upstream fine suspended sediment is derived ultimately from metamorphic, plutonic, and sedimentary rocks, and downstream bed load sediment is derived largely from the erosion of andesitic volcanic rocks and sediments. It is likely that these two sediment types remain more or less physically separated during transport and deposition. (Knapp-USGS)
W70-00446

GEOMORPHOLOGY OF A SAND RIDGE,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
J. Duncan Smith.
J Geol, Vol 77, No 1, p 39-55, Jan 1969. 17 p, 8 fig, 2 tab, 31 ref.

Descriptors: *Geomorphology, *Sand bars, *Currents (Water), Tides, Oceans, Islands, Dunes, Sand waves, Deposition (Sediments), Sedimentation, Erosion, Sedimentary structures.
Identifiers: Marthas Vineyard (Mass).

In the past, sand ridges and the associated marine sand waves have been studied extensively from a morphological point of view, but several important historical and dynamical problems associated with these features have been neglected. The present dynamical setting of a sand ridge (a shoal named Middle Ground) in Vineyard Sound, Massachusetts, is outlined and its origin is discussed. Sand waves cover the ridge. Those with amplitudes of 2 m are found to be completely rebuilt in half a tidal cycle, and those with amplitudes of 6 m are found to be significantly rebuilt over half a tidal cycle. Net movements of the sand waves are consistent with the counterclockwise net circulation of water around the ridge. Over the sand-wave crests the average maximum shear velocity is 4.5 cm/sec. Middle Ground is a body of sand, but its southwest extension (Lucas Shoal) is composed of glacial drift and veneered with sand. The geomorphological history of Middle Ground is traced from the deposition of a small Wisconsin recessional moraine, through a period of sea level rise during which wave erosion and longshore drift created an elongate submarine sand ridge, to a period of submergence during which waves modified the relic morainal feature and tidal currents reshaped both the submerged sand ridge and the relic moraine. The present morphology of the shoal is in dynamic equilibrium with the tidal current system, and large-scale morphological changes occur within a period of only a few years. (Knapp-USGS)
W70-00453

A RECONNAISSANCE OF STREAM SEDIMENT IN THE ERIE-NIAGARA BASIN, NEW YORK,
Geological Survey, Albany, N.Y.
R. J. Archer, and A. M. La Sala, Jr.
N Y State Water Resources Comm Basin Planning Rep ENB-5, 1968. 34 p, 7 fig, 4 tab, 9 ref.

Descriptors: *Sediment load, *New York, Suspended load, Bed load, Sediment yield, Streamflow, Erosion, Deposition (Sediments), Sedimentation, Lake Erie, Surveys, Sampling.
Identifiers: *Erie-Niagara Basin (NY).

A reconnaissance study of erosion and deposition of sediment in the Erie-Niagara basin indicates that the highest sediment yields, on the order of 1,000 tons/sq mi/yr, occur in streams that drain upland areas. In contrast, for example, from the lowland part of the Tonawanda Creek basin, the annual sediment yields are on the order of 100 tons/sq mi/yr. The estimated average annual sediment yields of streams in the basin range from 50 tons/sq mi for Little Tonawanda Creek at Linden, to 1,500 tons/sq mi for Cazenovia Creek at Ebenezer. These estimates are based on measured instantaneous sediment discharge at selected stream stations, the sediment loads of which ranged from 1,100 tons/yr for Little Tonawanda Creek at Linden to 610,000 tons/yr for Cattaraugus Creek at Gowanda. Peak suspended-sediment concentrations in the range of 2,600 to 5,300 ppm were observed at 3 stations in the Cattaraugus Creek basin, as well as at Buffalo Creek at Gardenville, Cazenovia Creek at Ebenezer, and Cayuga Creek near Lancaster. (Knapp-USGS)

GRAIN SIZE DISTRIBUTIONS AND DEPOSITIONAL PROCESSES,
Tulsa Univ., Okla.
Glenn S. Visher.
J Sediment Petrol, Vol 39, No 3, p 1074-1106, Sept 1969. 33 p, 21 fig, 1 tab, 52 ref. Grant No GA-997 and GA-1635 NSF.

Descriptors: *Deposition (Sediments), *Particle size, *Sands, Sedimentation, Statistical methods, Sedimentary petrology, Settling velocity, Sedimentation rates, Sediment transport, Sediment distribution, Sediments, Waves (Water), Suspended load, Bed load, Dunes, Winds.
Identifiers: Sedimentary textures, Sedimentary environment, Sedimentation dynamics.

Extensive textural study of both modern and ancient sands has provided the basis for a genetic interpretation of sand texture. Analysis is based on recognizing sub-populations within individual log-normal grain size distributions. Each log-normal sub-population may be related to a different mode of sediment transport and deposition, thus providing a measure of their importance in the genesis of a sand unit. The 3 modes of transport reflected are: (1) suspension; (2) saltation; and (3) surface creep or rolling. Each of these is developed as a separate sub-population within a grain size distribution. The number, amount, size-range, mixing, and sorting of these populations vary systematically in relation to provenance, sedimentary process, and sedimentary dynamics. The analysis of these parameters is the basis for determining the process-response characteristics of individual sand units. A number of processes are uniquely reflected in log-probability curves of grain size distribution of sands and sandstones. These include: (1) current; (2) swash and backwash; (3) wave; (4) tidal channel; (5) fallout from suspension; (6) turbidity current; and (7) aeolian dune. The combination of 2 or more of these processes also produce characteristics log-probability plots of ancient sands are directly comparable to those from modern sands. The principal limitation of this study is in comparing sands formed under comparable conditions and obtaining an independent determination of the processes of formation of ancient sands. (Knapp-USGS)

STRATIGRAPHY AND SEDIMENTOLOGY OF THE TERTIARY ROCKS OF THE MANDAMUS-DOVE RIVER AREA, NORTH CANTERBURY, NEW ZEALAND,
Pennsylvania Geological Survey, Harrisburg.
W. D. Sevon.
New Zeal J Geol and Geophys, Vol 12, No 1, p 283-309, May 1969. 27 p, 12 fig, 3 tab, 19 ref.

Descriptors: *Stratigraphy, *Sedimentology, *Sedimentary rocks, Tertiary period, Geology, Conglomerate rocks, Coals, Sands, Currents

(Water), Marine geology, Algae, Biomass, Volcanoes, River basins, Subsidence, Mapping, Analytical techniques, Fractures (Geology).
Identifiers: *New Zealand, *North Canterbury, Tertiary rocks.

A sedimentological study of the Tertiary sediments of the Mandamus-Dove River area in North Canterbury, New Zealand, indicates that fluvial conglomerates and coal were the first sediments deposited on a Cretaceous peneplain developed on greywackes of the Torlesse Group. Subsequent cross-bedded glauconitic sands were deposited by north-flowing longshore currents following marine transgression in the area. Rapid build-up of bedded tuffs produced by volcanic activity to the northeast diverted longshore current sedimentation from the area and permitted an environment suitable for the growth of an algal-crinoidal-bryozoan biostrome. Cessation of volcanic activity and continuing basin subsidence halted biostrome growth and allowed renewed deposition of detritus by marine currents. (Gabriel-USGS)

RECENT SEDIMENTATION AROUND NORTHERNMOST NEW ZEALAND,
New Zealand Oceanographic Inst., Wellington. Dept. of Scientific and Industrial Research.
C. P. Summerhayes.
New Zealand J Geol and Geophys, Vol 12, No 1, p 172-207, May 1969. 36 p, 15 fig, 3 tab, 35 ref.

Descriptors: *Sediments, *Sedimentation, *Marine geology, *Continental shelf, *Provenance, Sea level, Water level fluctuations, Glaciation, Detritus, Organic matter, Mineralogy, Basalts, Algae, Pleistocene epoch, Erosion, Mapping.
Identifiers: *New Zealand, Recent continental shelf sedimentation.

Relict shallow water sediments, formed during the post-glacial rise in sea level, cover the continental shelf off northernmost New Zealand. Supplies of detrital sediment are negligible and biogenic skeltal debris is the only sediment component being supplied to the sea floor at present in any large quantity. Glauconite is forming over much of the region and active sediment movement is restricted to the nearshore environment. Detrital non-carbonate sediment in the eastern part of the region has a southern basaltic provenance; that to west and north has an andesitic provenance and is derived in part from the south and in part locally. On Maria Ridge are rich calcarenites which are forming slowly at present. On banks on the Ridge sedimentation is extremely slow and thick algal growths have accumulated around basalt pebbles left on Pleistocene marine erosion terraces. (Gabriel-USGS)

A. M. Trofimov, and Yu. P. Perevedentsev.
Vestnik Moskov Univ, Ser 5, Geogr, No 4, p 90-94, July-Aug 1969. 5 p.

Descriptors: *Geomorphology, *Mathematical studies, *Alluvium, *Slopes, *Erosion, Sedimentation, Profiles, Velocity, Deformation, Soil mechanics, Mathematical models, Geologic control, Land forming, Terrain analysis, Topography.
Identifiers: Deluvial slopes.

After briefly reviewing the contributions made by Strahler, Culling, Devdariani, Sheidegger, and others in the analytical studies of the evolution of deluvial slopes, a new analytical expression for the evaluation of a slope profile was proposed. This analytical expression gives the height of any profile point as a function of the horizontal distance and two empirical constants. In the final equation, the initial slope form is of considerable significance. (Gabriel-USGS)

SEDIMENTOLOGY OF THE WAITEMATA GROUP IN THE STANLEY POINT-DEVONPORT AREA, AUCKLAND, NEW ZEALAND,
Australian National Univ., Canberra. Dept. of Geology.
Brian G. Jones.
New Zeal J, Geol and Geophys, Vol 12, No 1, p 215-247, May 1969. 33 p, 16 fig, 2 tab, 21 ref.

Descriptors: *Sedimentation, *Sedimentology, *Stratigraphy, Sandstones, Silts, Currents (Water), Petrology, Model studies, Mapping, Structural geology, Scour, Petrography, Mineralogy, Analytical techniques, Detritus, Plankton, Diagenesis, Plants, Geology.
Identifiers: *New Zealand, *Auckland, Waitemata group.

A stratigraphic column shows the alternating sequence of sandstones and siltstones of the Lower Miocene Waitemata turbidite sediments, New Zealand. Descriptions of the sedimentary features, current direction indicators, grain size analyses, petrology, and trace fossils are given especially with regard to their use as possible correlation factors. The use of a model relating current direction variation within an expanding lobate turbidity current is discussed, together with its application for determining axial flow direction of the turbidity current and the direction of thickening of the turbidite sandstone. It is concluded that the best possible method of correlating the uniform sequence of unfossiliferous sediments available at present is by means of close-spaced detailed stratigraphic columns together with graphs of sandstone-siltstone ratio and bed thickness variations with respect to stratigraphic height. (Gabriel-USGS)

SEDIMENTARY FEATURES AND PENECONTEMPORANEOUS SLUMPING IN THE WAITEMATA GROUP, WHANGAPARAOA PENINSUAL, NORTH AUCKLAND, NEW ZEALAND,
Auckland Univ. (New Zealand). Dept. of Geology
M. R. Gregory.
New Zeal J Geol and Geophys, Vol 12, No 1, p 248-282, May 1969. 35 p, 22 fig, 45 ref.

Descriptors: *Sedimentology, *Slope stability, *Turbidity currents, *Sedimentary structures, Detritus, Marine geology, Mapping, Currents (Water), Structural geology, Sandstones, Folds (Geology), Estuaries, Faults (Geology).
Identifiers: *New Zealand, *Auckland, Waitemata Group, Sedimentary features.

Rocks belonging to a turbidite facies of the Lower Miocene Waitemata Group are exposed extensively about Whangaparaoa Peninsula, New Zealand. Interbedded with this sequence are a number of thick, distinctive, volcaniclastic grits believed to have been emplaced by submarine lahars. These sediments accumulated towards the axial parts of a marine basin within a continental borderland. The turbidites were deposited by predominant southeast-flowing currents. Directions of weak bottom traction currents were more variable. Deformation and contortion of strata occur on a grand scale and are attributed to the penecontemporaneous slumping of poorly consolidated sediments in response to tilting of the sea floor. Injection of clastic dikes accompanied later stages of movement in slumped sequences. Evidence suggests that one great slump sheet extends over a distance of at least 10 miles from near Red Beach in the west to Whangaparaoa Head and possibly Tiritiri Matangi in the east. (Gabriel-USGS)

OPTICAL METHOD FOR DETERMINING PARTICLE SIZES OF COARSE SEDIMENT,
Geological Survey, Washington, D.C.
John R. Ritter, and Edward J. Helley.
Geol Surv Prelim Rep Tech Water-Resources Invest, Book 5, Chapter C3, 1969. 33 p, 11 fig, 8 tab, 8 ref.

Descriptors: *Analytical techniques, *Particle size, *Sediments, *Instrumentation, Volumetric analysis, Photography, Streambeds, Gravels, Sands, Computer programs.
Identifiers: *Optical methods, Particle-size analyzer.

Although the volumetric analysis of sandy bed material with the particle-size analyzer does not agree closely with analysis by the standard sieving technique, the volumetric analysis is better for gravel and coarser bed material than the Wolman areal method of analysis. Because of the speed with which the analysis can be made and the quantity of material used in the volumetric analysis, this method appears to be the best available for gravel. Furthermore, modern techniques of rapid data processing are applicable to the volumetric method of analysis. A computer program for processing particle-size data by the volumetric method has been written and used successfully. (Carstea-USGS)

AN INVESTIGATION OF THE RELATIONSHIPS BETWEEN LANDSCAPE-GEOMORPHOLOGICAL FACTORS AND SEDIMENT RUNOFF OF THE RIVERS OF THE WESTERN TRANSCAUCASUS (IN RUSSIAN),
Moscow State Univ. (USSR).
L. F. Litvin.
Russian text with English summary. Vestnik Moskov Univ, Ser 5, Geogr, No 4, p 60-64, July-Aug 1969. 5 p, 4 fig.

Descriptors: *Sediment transport, *Streamflow, *Watersheds (Basins), *Geomorphology, Erosion, Slopes, Estuaries, Altitude, Geology, Sediment load, Vegetation effects, Weathering, Precipitation (Atmospheric).
Identifiers: *USSR, Transcaucasus.

A relationship between the total river transport and geomorphological parameters of river watersheds were investigated using hydrogeological data recorded at the three rivers of the Western Transcaucasus. The geomorphological parameters were assumed to be atmospheric precipitation, rock lithology, average watershed altitude, and stream slope patterns. High altitude zones and rock lithology are the most significant factors in sediment transport capacity of a river from the headwater to the mouth. (Gabriel-USGS)

ERODIBILITY OF SAND-CLAY MIXTURES AS EVALUATED BY A WATER JET,
Purdue Univ., Lafayette, Ind.
R. N. Rhasin, C. W. Lovell, Jr., and G. H. Toebes.
Available from the Clearinghouse as PB-187 272, $3.00 in paper copy, $0.65 in microfiche. Purdue University Water Resources Research Center Technical Report No 8, June 1969. 207 p, 42 fig, 31 tab, 99 ref. OWRR Project A-003-IND.

Descriptors: *Erosion control, Geomorphology, Clay, Graded, Stream stability, Cohesive soil, Particle size, Sand, Cohesionless soils, Soil stabilization, Abrasion.
Identifiers: *Erodibility, Water jet, Jet velocity.

Laboratory produced soil samples were subjected to erosion by means of 1/4 in. and 3/8 in. diam. submerged water jets. Special care was taken to control all variables that could effect the soil system behavior. The influence on erosion of the sample mixing and curing procedures, the grain size distribution and the ratio of constituent materials, including water content, was given attention. Samples were made from commercial clay (grundite) mixed with one or two grades of Ottawa Sand. Compaction pressures were 2.0 psi. Both the reate of weight loss due to erosion and undrained shear strength (using a laboratory vane) were determined. Obtained relationships between all named variables has been presented in both graphical and analytical form.

NATURAL ORGANIC ACIDS IN THE TRANSPORTATION, DEPOSITION, AND CONCENTRATION OF GOLD,
Colorado School of Mines, Golden; and Geological Survey, Denver, Colo.
H. Ling Ong, and Vernon E. Swanson.
Quart Colo School of Mines, Int Geochem Explor Symp, Vol 64, No 1, p 395-425, Jan 1969. 31 p, 7 fig, 6 tab, 67 ref. Grant No 9300-146-67 (USGS).

Descriptors: *Gold, *Organic acids, *Streamflow, Deposition (Sediments), *Transportation, Water chemistry, Chlorides, Carbonates, Equilibrium, Lakes, Peat, Sulfates, Hydrogen, Ions, Analytical techniques, Carbon, Oxygen, Nitrogen, Colloids, Coagulation.
Identifiers: Gold compounds, Geochemical prospecting.

Geochemistry of gold in natural waters was investigated by using experimental studies and the results of earlier publications. Organic concentrations in the range of 3 to 30 ppm have the capacity to reduce gold chloride solutions to negatively-charged colloids of metallic gold. For the 30 ppm organic acid solutions, the reduction process is accomplished by the formation of a protective coating of hydrophobic gold sol making the gold very stable for a considerable time (at least 8 months). For smaller concentrations (3 ppm) of organic acid, the protective coating is not formed and the colloidal gold precipitates. In very acid solutions the presence of organic matter causes the reduction of gold chloride, and metallic gold of colloidal size is precipitated and intimately associated with the organic matter. In slightly acid to basic waters, that is in the general range of natural waters, gold can only be transported as stable organic-protected colloids. These organic-protected gold colloids are precipitated when they enter a different chemical environment (sea or brackish water) or when they enter an acid environment. (Gabriel-USGS)

OXIDIZING-REDUCING CONDITIONS OF THE 'NAFTUSIA' MINERAL WATERS FORMATION (RUSSIAN),
A. I. Germanov, I. P. Paseka, and P. M. Pylat.
Sovetskaya Geologiya, SSSR, Issue No 6, p 139-146, 1969. 8 p, 3 fig, 2 tab, 8 ref.

Descriptors: *Mineral water, *Oxidation, *Reduction (Chemical), *Groundwater, *Groundwater movement, *Springs, Organic matter, Water analysis, Carbonates, Calcium, Magnesium, Geologic mapping, Structural geology, Stratigraphy, Sediments, Geochemistry, Water temperature, Sulfates, Chlorine.
Identifiers: *USSR, Lvov, Ukraine.

Truskavets mineral spring in the Lvov area, Ukraine, was investigated on the basis of hydrological and hydrochemical data. Hydrodynamically the spring waters are associated with a small artesian groundwater basin located in one of the folds of a large anticline. The water-bearing zones are a sweet-water zone containing 0.7 to 0.9 gr/l of mineralized matter, a sodium, calcium-chlorine sulfate water zone containing 2.0 to 8.0 gr/l of mineralization, and a chloride-sodium zone of of high mineralization and salinity containing some hydrogen sulfide. Descriptions of the oxidation-reduction processes and the curative properties of the spring waters are also given. (Gabriel-USGS)

ON THE GEOCHEMISTRY OF UPPER PALEOZOIC AND LOWER MESOZOIC SEDIMENTS OF THE NORTHERN PART OF THE CISVERKHOYANSK TROUGH (RUSSIAN),
Akademiya Nauk SSSR. Institut Geologii.
A. F. Safronov.
Sovetskaya Geologiya, SSSR, Issue No 7, p 145-148, 1969. 4 p, 3 ref.

Descriptors: *Geochemistry, *Sediments, *Mesozoic era, *Paleozoic era, *Structural geology, Oil reservoirs, Gases, Organic matter, Carbon, Chemical analysis, Oxidation-reduction potential, Analytical techniques, Sulfur, Iron, Pyrite, Bituminous materials, Boreholes, Sands, Diagenesis.
Identifiers: *USSR, Verkhoyansk trough.

Sediments of the Cisverkhoyansk trough of northeastern Siberia were investigated on the basis of surface and borehole samplings for the evaluation of oxidation-reduction processes. The Upper Paleozoic and Lower Mesozoic sediments were developed in a weakly-oxidizing and strongly-reducing geochemical environment at depths of over 1500 m. It is conceivable that under optimal thermodynamical conditions these sediments could form hydrocarbons suitable for the development of gas and oil reservoirs. (Gabriel-USGS)

THORIUM-228 IN MARINE PLANKTON AND SEA-WATER,
Cape Town Univ. (South Africa). Dept of Physics, and Division of Sea Fisheries, Sea Point (South Africa).
R. D. Cherry, I. H. Gericke, and L. V. Shannon.
Earth and Planetary Sci Letters, Vol 6, No 6, pp 451-456, Sept 1969. 6 p, 1 fig, 1 tab, 24 ref.

Descriptors: *Radioisotopes, *Sea water, *Plankton, *Radiochemical analysis, Sampling, Tracers, Tracking techniques, Water chemistry.
Identifiers: *Thorium radioisotopes.

Data are given for thorium-228 in zooplankton, phytoplankton and sea water from seven different oceanographical water masses in the South Atlantic and around the Southern African coast. The levels in plankton are easily detectable. What appear to be real variations from one water mass to another were observed, and the possible utility of thorium-228 as a natural oceanographic tracer is noted. The levels in sea water are in general at or below the sensitivity level of the technique used, but for one set of samples a particularly high thorium-228 content was obtained. This set is from the Walvis Ridge area, and this region is particularly interesting in thorium and certain other trace elements. (Knapp-USGS)

OCEANIC CONCENTRATIONS OF RADIUM-228,
State Univ. of New York, Stony Brook. Dept. of Earth and Space Sciences.
Willard S. Moore.
Earth and Planetary Sci Letters, Vol 6, No 6, p 437-446, Sept 1969. 10 p, 5 fig, 3 tab, 10 ref. Grant AT (30-1)3629 (AEC).

Descriptors: *Water chemistry, *Sea water, *Radium radioisotopes, Mixing, Currents (Water), Water circulation, Tracers, Analytical techniques, Radiochemical analysis, Sampling.
Identifiers: Thorium radioisotopes.

This paper evaluates the worldwide oceanic distribution of Ra-228. Nearshore waters, especially waters from restricted bays and sounds, are very high in unsupported Ra-228. The concentrations decrease away from land. The Ra-228 content of surface waters bears a close correlation with the proximity to land. Samples from the Atlantic Ocean are higher than those from the Pacific Ocean. Apparently the source of Ra-228 in surface waters is diffusion from Th-232-bearing sediments in contact with these waters. Deep water samples collected less than 100 m from the sea floor have significant Ra-228 concentrations. Apparently Ra-228 is diffusing from deep-sea sediments as it is from nearshore sediments. Deep Pacific samples are generally lower than deep Atlantic samples. This may mean that Ra-228 released from Pacific sediments is mixed upward more rapidly, thereby decreasing the near-bottom concentrations. Intermediate water samples have less Ra-228 than either surface or bottom samples from the same area. These concentrations are near the lower limit of detection. Because the vertical mixing rate of the ocean is much greater than the mean life of Ra-228, little Ra-228 can penetrate into the intermediate ocean. (Knapp-USGS)

THE EXCHANGE OF HYDROGEN ISOTOPES BETWEEN ICE AND WATER IN TEMPERATURE GLACIERS,
Iceland Univ., Reykjavik. Science Inst.

Bragi Arnason.
Earth and Planetary Sci Letters, Vol 6, No 6, p 423-430, Sept 1969. 8 p, 3 fig, 1 tab, 17 ref.

Descriptors: *Water chemistry, *Glaciers, *Deuterium, Stable isotopes, Tritium, Tracers, Paleoclimatology, Mixing, Ice, Water, Melting, Freezing, Thermodynamics, Precipitation (Atmospheric).
Identifiers: Hydrogen isotopes, Isotope exchange, Temperate glaciers, Iceland.

Isotopic exchange between ice and water is found to take place in temperate glaciers. This exchange causes homogenization of deuterium in snow during summer thaws, together with a general increase in deuterium concentration. Ice in a temperate glacier is therefore more homogeneous and has a higher deuterium concentration than the precipitation on the glacier. The difference between the average deuterium concentration in ice and precipitation gives information about the runoff ratio. (Knapp-USGS)

EXPERIMENTAL DISSOLUTION OF CALCIUM, MAGNESIUM, AND STRONTIUM FROM RECENT BIOGENIC CARBONATES: A MODEL OF DIAGENESIS,
George Washington Univ., Washington, D.C.
Johannes H. Schroeder.
J Sediment Petrol, Vol 39, No 3, p 1057-1073, Sept 1969. 17 p, 11 fig, 2 tab, 65 ref.

Descriptors: *Diagenesis, *Carbonate rocks, *Water chemistry, *Solubility, Bioindicators, Paleoclimatology, Calcium, Magnesium, Trace elements, Carbonates, Thermodynamic behavior, Laboratory tests, Leaching.
Identifiers: Biogenic carbonate deposits.

Laboratory experiments at ordinary temperature and pressure for periods up to 240 days on recent biogenic carbonate materials showed that fresh water and sea water dissolve aragonite and magnesium calcite prior to mineralogical changes. The observed rates of dissolution of calcium, magnesium, and strontium indicate that these elements are incorporated in aragonite and magnesium calcite in more than one way (in lattice positions, absorbed in lattice interstices, or as inclusions). This suggests the presence of more than one mineral phase in the skeletal material studied; these phases differ in response to solution, in quantity, and probably in chemical composition. Calcium, magnesium, and strontium are dissolved in proportions different from those in the original solid. The experimentally established sequence of preference is Mg, Ca, Sr. Factors found to determine direction and degree of incongruency in dissolution include mineralogy (number, kind, and relative abundance of phases present), chemical composition, physiologic effects (taxonomy and non-taxonomy related), and chemical composition and volume of waters effective in dissolution. Incongruent dissolution determines abundance of ions derived from solids in the diagenetic environment and hence, ion availability for precipitation in cement and for inhibition or catalysis in inversion or cement precipitation. Because of incongruent dissolution Mg and Sr contents of shells are not dependable for paleo-environmental analysis. (Knapp-USGS)

IMPLICATIONS OF THE MINOR ELEMENT CONTENT OF SOME MAJOR STREAMS OF THE WORLD,
Geological Survey, Washington, D.C.
W. H. Durum, and Joseph Haffty.
Geochim et Cosmochim Acta, Vol 27, p 1-11, 1963. 11 p, 6 fig, 4 tab, 16 ref.

Descriptors: *Trace elements, *Rivers, *Surveys, Water quality, Water chemistry, Geochemistry, Data collections, Solutes, Runoff, Aqueous solutions.
Identifiers: Geochemical river surveys, Minor elements.

Of 15 or more minor elements in the world's principal river waters only aluminum, iron, manganese, barium and strontium range much over 100 micrograms/liter. Most minor elements range at or below 100 micrograms/liter and have median (or middle) values of 10 micrograms per liter or less. Significant areal differences in minor element content are found in the river waters. For example, Atlantic Coastal river waters in the aggregate are slightly more enriched in concentrations of silver, chromium, manganese, molybdenum, nickel, strontium, and titanium, and slightly deficient in barium and lithium when compared with median values for North America. Median values of ration Ba/Sr. Ni/Cr and Ni/Cu are reasonably consistent (within a factor of two) in principal drainage from North America. Noteworthy are consistent median rations of Ni/Cu for large rivers of United States, but the ratio tends to be slightly greater in global northern latitudes than in southern latitudes. Median values for aluminum, barium, copper, lead, molybdenum and silver in North American runoff are of the same order as published world averages for ocean water. Hydrologic and geochemical aspects of continental runoff are strongly implied in observations of minor element content of large rivers. Evidence to date is that median values of Ba/Sr ratios are relatively uniform in global river waters. There is real danger in over simplifying chemical systems in broad assessments of lower reaches of large drainage basins because individual hydrologic and chemical events upstream are largely obscured. SOME CHARACTERISTICS OF THE WATERS OF GEORGIAN MUD VOLCANOES (IN RUSSIAN),
Akademiya Nauk Azerbaidzhanskoi SSR, Baku. Institut Geologii.
M. F. Dzvelaya, and Ad. A. Aliyev.
Published in Russian with English and Georgian summaries. Soobshch Akad Nauk, Gruz SSR, Vol 54, No 1, p 121-124, Apr 1969. 4 p, 1 fig, 5 ref.

Descriptors: *Water chemistry, *Chemical properties, *Mudflows, *Volcanoes, Iron oxides, Mud, Carbonates, Chlorides, Alkaline water, Salinity, Mineral water, Sodium, Calcium, Potassium, Sulfates, Organic matter, Boron, Trace elements.
Identifiers: *Georgia SSR, Mud volcanoes.

The chemical composition of the waters of the mud volcanoes of Eastern Georgia, USSR, were investigated. Waters of the great majority of mud volcanoes are of the hydrocarbonaceous (sodium) type and of the chloride group. The waters of the Kila-Kuprinskiy mud volcano, however, are of a chlorine-calcium type, chloride group, and show deeper origin. The trace elements vary from 6.9-11.0 mg/l of iodine and 74.0 to 85 mg/l of boron in Kila-Kuprinskiy volcano, and 0.7 mg/l of iodine, 94.0 mg/l of bromine, and 16.0 mg/l of boron in the waters of Akhtal'skiy volcano. It is of interest to note that the presence of organic matter, boron, and iodine associated with an insignificant amount of sulfates in the waters of the mud volcanoes suggests some genetic association between the mud volcanoes and oil- and gas-bearing occurrences of Eastern Georgia. DIAGENESIS, CHEMICAL SEDIMENTS, AND THE MIXING OF NATURAL WATERS,
Colorado Univ., Boulder. Dept. of Geological Sciences.
Donald D. Runnells.
J Sediment Petrol, Vol 39, No 3, p 1188-1201, Sept 1969. 14 p, 7 fig, 1 tab, 83 ref.

Descriptors: *Chemical reactions, *Water chemistry, *Diagenesis, *Mixing, Solutes, Chemical precipitation, Aqueous solutions, Electrolytes, Ions, Ion exchange, Chemical degradation, Corrosion, Groundwater movement, Soil water movement, Leaching, Mineralogy.
Identifiers: Chemical sediments.

The chemical effects of mixing in the laboratory include changes in the concentration and electrical properties of a solution, shifts in homogeneous equilibria, and precipitation or dissolution of a solid phase. Similar chemical effects occur in nature as a result of the mixing of natural waters, and in some instances these may result in diagenesis. A simple classification yields 14 distinct categories of natural waters with 91 possible combinations of mixing of pairs of such waters. Examples are known of the precipitation of hydroxides and carbonates as a result of the mixing of chemically dissimilar surface waters. Because of the great variety of chemically dissimilar subsurface waters, plus the existence of potential fields which cause the movement of subsurface waters, mixing and diagenesis in the subsurface may be a common and significant geologic process. The solubility of rock forming minerals is a non-linear function of such independent variables as salinity, partial pressure of gases, temperature, and so on. The dissolution of calcium carbonate as a result of 'Mischungskorrosion' can be viewed in the light of the non-linearity of the solubility curve. Mixing of solutions which differ only in their content of dissolved electrolytes may cause either the precipitation or dissolution of rock-forming minerals. (Knapp-USGS)

CHEMICAL QUALITY OF STREAMS IN THE ERIE-NIAGARA BASIN, NEW YORK,
Geological Survey, Albany, N.Y.
R. J. Archer, A. M. LaSala, Jr., and J. C. Kammerer.

NY State Water Resources Comm Basin Planning Rep ENB-4, 1968. 104 p, 18 fig, 1 plate, 24 tab, 24 ref, 2 append.

Descriptors: *Water quality, *Surface waters, *Groundwater, *Surveys, *New York, Water chemistry, Solutes, Hardness (Water), Water pollution, Data collections, Hydrologic data.
Identifiers: Erie-Niagara Basin (NY).

The streams in the 2,000-square-mile Erie-Niagara basin of western New York contain mainly a calcium bicarbonate type of water with a dissolved-solids content generally between 140 and 240 ppm. The dissolved-mineral content of shallow groundwater is the principal influence upon the chemical quality of the streams, except during and soon after periods of dilution by heavy precipitation or snowmelt. The average dissolved-mineral content of precipitation is about 35 ppm of dissolved solids, but substantially higher concentrations, as much as 327 ppm, have occurred. These high concentrations are attributed to industrial air pollution in the Buffalo area. Chemical analyses of more than 700 samples collected mainly during 1963 and 1964, including samples of precipitation and overland flow are compiled. Maps and graphs show significant regional and time variations in the natural water quality. (Knapp-USGS)

ESTUARINE STUDIES IN UPPER GRAYS HARBOR, WASHINGTON,
Geological Survey, Washington, D.C.
Joseph P. Beverage, and Milton N. Swecker.
Geol Surv Water-Supply Pap 1873-B, 1969. 90 p, 55 fig, 8 tab, 39 ref.

Descriptors: *Estuaries, *Water quality, *Water resources, *Washington, Circulation, Tides, Currents (Water), Water pollution effects, Path of pollutants, Dissolved oxygen, Oxygen demand, Water pollution sources, Tracers, Dye releases.
Identifiers: *Grays Harbor (Wash), Water resources research.

Circulation patterns, water-quality conditions, and bottom material in upper Grays Harbor, Washington, were studied to improve water resource management. Salt water was found to intrude at least as far as Montesano, 28.4 nautical miles from the mouth of the harbor. Longitudinal salinity distributions were used to compute dispersion (diffusivity) coefficients ranging from 842 to 3,520 sq ft per second. These values were corroborated by half-tidal-cycle dye studies. The waters of the harbor were found to be well mixed after extended periods of low fresh-water flow but stratified at high flows. Velocity-time curves for the upper harbor are distorted from simple harmonic functions owing to channel geometry and frictional effects. Net separation distances between top and bottom water ranged from 1.65 nautical miles when fresh-water inflow was 610 cfs to 13.4 miles when inflow was 15,900 cfs. The cumulative mean age from integration of the fresh-water velocity equation was about twice that obtained from the salinity distribution. Carbon content was low upstream and downstream of the upper harbor area, and high in the Cow Point-Rennie Island reach. The high-carbon-content reach coincides with the general area of a dissolved-oxygen sag. At Cosmopolis, the daily minimum dissolved oxygen content correlated well with discharge and tidal range. The upper harbor was found to contain 250 million cubic feet less water than average during the critical low-flow period, on the basis of the frequency distribution of predicted tides. About 78,000 pounds of dissolved oxygen is thus available for oxidation of waste during summer. (Knapp-USGS)

THE ROLE OF MARINE SCIENCES IN THE MULTIPLE USES OF THE COASTAL ZONE OF LAKE ERIE AND LAKE SUPERIOR,
National Planning Association, Washington, D.C. Center for Techno-Economic Studies.
Miller B. Spangler.
Available from Clearinghouse as PB 185 163 for $3 in paper copy, 65 cents in microfiche. Rep of Techno-Econ Studies Center, Nat Planning Ass, June 1969. 391 p, 7 fig, 10 tab, 8 append.

Descriptors: *Multiple-purpose projects, *Planning, *Great Lakes, *Water resources development, *Water pollution control, Lake Erie, Lake Superior, Water pollution treatment, Recreation, Industrial water, Municipal water, Navigation, Governments, Legislation, Water management (Applied).
Identifiers: Multiple shoreline uses (Great Lakes).

A study was made to identify measures in marine sciences which can be applied to the promoting of optimum use of the coastal zone of the Great Lakes. Lake Superior and Lake Erie were selected for study to illustrate the contrast of problems and opportunities in utilizing the waters and shoreline resources of the Great Lakes system. Lake Superior is the largest and deepest of the Great Lakes and with a few local exceptions is still basically of pristine character. Lake Erie by contrast, is the smallest and shallowest lake in the system, and with its intensively developed shoreline and hinterland has suffered probably the most extreme degradation of environmental quality. The analysis of these conditions has lead to the conclusion that the priority emphasis for action should be directed toward preservation of the essentially undeteriorated resources of Lake Superior, and to combating the further deterioration and restoration of the quality of resources of Lake Erie. A major conclusion of this study is that Lake Erie, far from being a 'dead Lake,' is capable of a significant degree of restoration of environmental quality if the sources of pollution entering Lake Erie are brought under effective control. Because of the relative shallowness of Lake Erie, the present rate of outflow into Lake Ontario discharges a total volume of water in only 2 1/2 yr equal to the volume of water contained in Lake Erie, which suggests that improvements in water quality could be achieved in a relatively few years. Recommendations are made to reinforce or to encourage reconsideration of essential actions leading to potentially new or expanded developments of coastal zone resources, particularly in those areas where regional, national, and international benefits may be forthcoming from a strengthened marine sciences program. CALCULATION OF SEDIMENT BALANCE OF THE LITTORAL ZONE (IN RUSSIAN),
Moscow State Univ. (USSR).
G. A. Saf'yanov.
Vestnik Moskov Univ, Ser 5, Geogr, No 4, p 121-122, July-Aug 1969. 2 p, 1 fig. Russian text with English summary.

Descriptors: *Sediment transport, *Sedimentation, *Littoral drift, Sedimentation rates, Gages, Mathematical studies, Surveys, Forecasting, Topography, Slopes, Sediment discharge.
Identifiers: Littoral zone, Sediment balance.

The sediment balance of a coastal section is determined by the difference between the sediment income of the section and its drifting outside the section. If a repeated measurement is made on the coastal section by fixed gage lines, it is possible to estimate the drift balance for the period between the two measurements. Drift balance is determined as an integral of the function describing changes of the relief (in cross section) along the water edge during the period between surveys. (Gabriel-USGS)

ENVIRONMENTALLY SIGNIFICANT SEDIMENTOLOGIC CHARACTERISTICS OF BEACH SANDS,
Geological Survey of New Zealand, Christchurch. Sedimentation Lab.
Peter B. Andrews, and G. J. Van der Lingen.
New Zeal J Geol and Geophys, Vol 12, No 1, p 119-137, May 1969. 19 p, 11 fig, 2 tab, 29 ref.

Descriptors: *Sediments, *Marine geology, *Beaches, *Sands, Slopes, Scour, Petrology, Stratigraphy, Statistical methods, Mapping, Detritus, Gravels, Frequency analysis, Texas.
Identifiers: New Zealand, Beach sands.

Comparative study of 5 South Island, New Zealand beaches and a beach on the central Texas coast suggests a short list of features that are diagnostic of the coastal beach. Beach sediments are clean (no mud matrix) and are very well to moderately well sorted. Foreshore strata occur as even, internally laminated, thin beds that dip seaward at low angles. The angle of dip is directly related to the slope of the foreshore surface, which in turn is largely dependent upon the mean size of the beach sediment; that is, the coarser the grain size the steeper the foreshore. Backshore strata occur as lense and slightly wedge-shaped internally laminated thin beds. Scour surfaces and cross-stratified lenses are characteristics. Dip of strata varies from 0 deg to 15 deg, and strata dip directly or obliquely landward. A transition zone (foreshore or above high tide level plus outer backshore) is characterized by mixed foreshore and backshore stratification, and some strata dip landward, others dip seaward. Many beaches furnish positively skewed distributions. It is concluded that skewness is not necessarily an environment-sensitive measure, and that skewness values commonly reflect grain size characteristics inherited from the source rocks. (Gabriel-USGS)
W70-00650

RELATIONSHIPS BETWEEN GRAIN SIZE, SIZE-SORTING, AND FORESHORE SLOPE ON MIXED SAND-SHINGLE BEACHES,
Canterbury Univ., Christchurch (New Zealand). Dept. of Geography.
R. F. McLean, and R. M. Kirk.
New Zeal J Geol and Geophys, Vol 12, No 1, p 138-155, May 1969. 18 p, 7 fig, 2 tab, 22 ref.

Descriptors: *Sediments, *Marine geology, *Beaches, *Sands, Slopes, Statistical methods, Computers, Hydraulic properties, Waves (Water), Permeability, Fluid mechanics, Analytical techniques, Frequency analysis, Sedimentary structures.
Identifiers: *New Zealand, South Island.

The variation of mean grain size, sorting, and beach face slope over mixed-sand shingle beaches at 2 areas along the east coast, South Island, New Zealand, is analyzed to determine the nature of the relationships between these 3 variables. The study is confined to mean grain sizes between 0.25 and 16.0 mm, and the sorting and slope values associated with this range of sizes. Trend analysis of the data has been performed by fitting curves with the aid of a computer. It is demonstrated that for given beaches curvilinear trends in size/sorting are reflected in slope/size relationship. Thus, the best sorted sediments are found to be associated with the steepest gradients on the curves, while zones of poor sorting are associated with 'plateaus' in the size/slope trend. It is suggested that size is the primary control of sorting trends in the sediments examined while hydraulic effects contribute to variability or spread of the data around the trend. Since size and sorting exert a primary influence on the beach face slope through permeability, it is further suggested that, for the study beaches at least, trends in the size/slope relationship clearly reflect the characteristics local distributions of size and sorting. (Gabriel-USGS)
W70-00651

OFF-SHORE SEDIMENTS, NORTH-WEST NELSON, SOUTH ISLAND, NEW ZEALAND,
New Zealand Oceanographic Inst., Wellington. Dept. of Scientific and Industrial Research.
William J. M. Van der Linden.
New Zeal J Geol and Geophys, Vol 12, No 1, p 87-103, May 1969. 17 p, 11 fig, 2 tab, 15 ref.

Descriptors: *Sediments, *Provenance, *Marine geology, *Currents (Water), *Continental shelf, Erosion, Streamflow, Rivers, Winds, Sands, Petrology, Sedimentation rates, Pleistocene epoch, Bathymetry, Seismic studies, Sampling, Mathematical studies, Mineralogy.
Identifiers: *New Zealand.

The Kahurangi Shoals, north-west of Kahurangi Point, Nelson, and the Westland and D'Urville Currents are the major factors influencing the sediment distribution and sedimentation processes on the north-western shelf of the South Island, New Zealand. The sediments are derived from two major sources, one the Kahurangi Shoals, the other the high Alpine region which supplies its erosion products to sea by steep mountain streams and rivers. The Westland and D'Urville Currents not only carry the Alpine detritus to the area but also largely control the sediment distribution pattern. Immediately south and north of Farewell Spit well sorted wind-blown sands derived from the Spit have accumulated, whereas further south in Golden Bay the sediments are mainly supplied by the Aorere and Takaka Rivers. Petrologically the shelf sands are mainly a quartz-feldspar association with magnetite, ilmenite, garnet, and hornblende as major constituents in the heavy mineral assemblage. The gravels and boulders derived from the Kahurangi Shoals consist mainly of well rounded quartzites. Seismic reflection profiles give an indication of the depositional history during and since the Pleistocene and provide information on the rate of sedimentation. (Gabriel-USGS)

THE APPEARANCE AND ORIGIN OF COLOURS IN MUDDY MARINE SEDIMENTS AROUND NEW ZEALAND,
New Zealand Oceanographic Inst., Wellington. Dept. of Scientific and Industrial Research.
H. M. Pantin.
New Zeal J Geol and Geophys, Vol 12, No 1, p 51-66, May 1969. 16 p, 1 fig, 2 tab, 9 ref.

Descriptors: *Sediments, *Color, *Marine geology, *Geochemistry, Sampling, Chemical analysis, Absorption, Organic matter, Iron compounds, Silicates, Manganese, Mapping, Mud, Analytical techniques, Sedimentation.
Identifiers: *New Zealand.

Muddy marine sediments in the New Zealand region show a considerable range of color. Thirty-five representative samples were selected and divided into groups. Simple chemical tests were applied to these samples in order to obtain information regarding the nature of the chemical compounds which control the color of these sediments. The color of the sediments appears to be controlled mainly by adsorbed compounds of various types. These compounds include: (a) a particular type of organic matter, which gives rise to an olive hue; (b) certain iron compounds (probably silicates) which contain exchangeable ferric iron, and are sometimes partly responsible for an olive hue; (c) ferric oxide or hydroxide, which gives rise to orange, yellowish brown or yellow hues; and (d) manganese dioxide, which also gives rise to orange or yellowish brown hues but which produces considerably darker sediments than ferric oxide or hydroxide. COMPARATIVE ECOLOGY OF SANDSPIT PONDS,
Oberlin Coll., Ohio. Dept. of Biology.
Edward J. Kormondy.
The Amer Midland Natur, Vol 82, No 1, p 28-61, July 1969. 34 p, 9 fig, 10 tab, 53 ref.

Descriptors: *Lakes, *Ecology, *Ponds, *Sand spits, Lagoons, Lake Erie, Organic matter, Vegetation, Plant population, Alkaline water, Carbonates, Water chemistry, Phytoplankton, Seasonal, Carbon radioisotopes, Productivity, Invertebrates, Oxygen, Photosynthesis, Mapping.
Identifiers: Sand spit pond ecology, Presque Island (Pa).

Limnology, productivity and community metabolism of a series of beach and lagoon ponds, located on a sandspit in Lake Erie, Pennsylvania, were investigated by using chemical, biological and geological techniques. Organic matter which has accumulated to a maxi-m-m of 0.8 m in one pond, results in reduction of size approximately 60% and 95% in 50 and 75 yr, respectively. Significant macrovegetational characteristics include the replacement of initial colonizers and the appearance of floating-leaved species in 30 or 40 yr. The ponds are all moderately to well buffered alkaline systems with medium to high levels of carbonates. Phytoplankton density is greatest in late July to early August with the species diversity greatest in midsummer. Annual net productivity is lower in older beach ponds, and standing crop of chlorophyll 'a' showed considerable variation annually and by stage of succession. Colonization by invertebrates is via secondary invasion subsequent to the establishment of the ponds. Community metabolism showed a change in the ratio of photosynthesis to respiration from 1.0 in the youngest pond to 0.33 in the oldest pond. (Gabriel-USGS)

POWER, WATER AND FOOD FOR DESERT COASTS: AN INTEGRATED SYSTEM FOR PROVIDING THEM,
Arizona Univ., Tucson. Environmental Research Lab.
Carl N. Hodges, and Carle O. Hodge.

Amer Soc Hort Sci, 66th Ann Meet, Pullman, Wash, Aug 20-22, 1969. Paper, 16 p, 4 fig, 3 tab, 11 ref.

Descriptors: *Arid lands, *Water supply, *Desalination, *Evaporation control, *Vegetable crops, Electric power, Greenhouses, Desalination apparatus, Sea walls, Sea water, Water resources development.
Identifiers: *Gulf of California, *Abu Dhabi, Arabian Peninsula, Diesel generators.

The world has about 20,000 miles of arid coastline with 2.6 million square miles of adjacent arid land 100 feet or less above sea level (a reasonable lift to provide fresh water if it could be obtained economically from the ocean). While much of this land has a sparse population and little or no cultivation, because of the shortage of fresh water, could be productive and habitable if power, food and fresh water were available. Work started in 1966 to design an integrated power-food-water production system for such locations. An integrated, closed environment system was developed utilizing waste heat from diesel-electric generators to desalt sea water. The fresh water is utilized to grow vegetables in air-inflated greenhouses. A pilot plant on the Gulf of California is providing power, water and high quality vegetables for a small fishing community. A large-scale installation is being designed in the Arabian Peninsula Shaikdom of Abu Dhabi. (Crouse-Arizona)

PARAMETRIC ECONOMIC AND ENGINEERING EVALUATION STUDY FOR WATER DESALINATION,
Booz-Allen Applied Research, Inc., Bethesda, Md.
A. P. Christodoulou, G. R. Olsson, and M. J. Monnik.
Office of Saline Water Research and Development Report No 488, 1969. 188 p. OSW Contract 14-01-0001-1825.

Descriptors: *Desalination, *Electrodialysis, *Membrane Processes, Cost Optimization, Plant Design.
Identifiers: *Desalination Apparatus, *Electrochemistry, Computer Algorithm, Economics.

A parametric engineering and economic analysis of the electrodialysis process was performed in which water costs were examined for the demineralization of three reference brackish waters in plant sizes from 1 to 50 mgd. Capital costs were based on scaled-up two-meter stack designs of both the tortuous path and sheet flow types and on detailed plant designs. Operating costs were based on both state-of-the-art technology and on projected technological improvements in critical components and process parameters. A computational algorithm for electrodialysis process analysis and costing was developed and programmed. (Mintz-Office of Saline Water)

LAND USE ALONG A TROPICAL CLIMATIC BOUNDARY: THE WALAWE GANGA BASIN OF CEYLON,
National Academy of Sciences-National Research Council, Washington, D.C.
Simon Baker.
Available from Clearinghouse as AD-679 458 for $3 in paper copy, 65 cents in microfiche. Final Rep of Nat Acad Sci-Nat Res Counc, 1968. 251 p, 40 fig, 7 tab, 93 ref. N00014-67-A-0244-0001.

Descriptors: *Land use, *Climatology, *Synoptic analysis, *Rural areas, Tropical regions, Humid areas, Arid lands, Wet climates, Climatic zones, Aerial photography, Surveys, Topography, Mapping.
Identifiers: *Ceylon, Walawe Ganga Basin, Climatic boundaries.

The Walawe Ganga Basin of southern Ceylon, lying partly in the dry and wet zones, is an area which has been earmarked for large-scale development and for settlement of population from the more crowded portions of the wet zone of the Island. It is generally recognized that the wet zone-dry boundary passes through this basin. None of the accepted criteria for the delineation of this boundary agree as to its location in the basin. A major purpose of this study is to show the exact location of the boundary as determined by observations of land use and vegetation types on aerial photographs and in the field. The relationship and influence on the location of the boundary of topography, relief, quantity, and seasonal distribution of rainfall are also examined. Land use throughout the Walawe Ganga Basin and several adjoining areas has been mapped in great detail for the first time. A planimetric analysis of the land use types in the climatic zones shows the quantitative and distributional differences in them. Field observations and interpretation of aerial photographs provide the background for a discussion of qualitative differences between land use types in the climatic zones. A study of the history of land use in the basin over the past 2500 yr indicates previous responses to the physical environment of the basin. (Knapp-USGS)

MICRO-IRRIGATION BY CATCHMENT TANK,
M. G. Ionides.
Ekistics, Vol 24, No 142, p 252-255, 1967. 1 fig.

Descriptors: *Arid lands, *Irrigation, *Water yield improvement, *Impervious membranes, Dry farming, Water supply, Water storage, Semiarid climates, Microenvironment, Water harvesting.
Identifiers: *Catchment tanks, *Micro-irrigation, *Sudan, *Gardens, *Food production.

Attention is drawn to the desirability of developing small catchment and storage system for the irrigation of kitchen gardens as a means of supplying fresh vegetables and fruits to peasant families in semiarid developing countries. Fifty gallons of water a day can provide 10 lbs. of vegetables and fruits daily. Although this is more than might be carried from a village well or spring, it might be provided by a lined and covered tank in the ground with a prepared catchment apron. The successful trial of such a system in the Sudan is discussed. Although the growing season was dry, there was sufficient precipitation at other times to fill the tank. (Crouse-Arizona)

Office of Saline Water Research and Development Progress Report No 463, Oct 30, 1969. 192 p. OSW Contract 14-01-0001-463.

Descriptors: Chemical analysis, *Mineral water, *Water softening, Saline water, Brackish water, Desalination, Electrodialysis, Water quality, *Water supply, Costs, Economics, Evaluation, *Economic efficiency.

Webster, S.D., (population 2,500) was one of five sites chosen by the Office of Saline Water for the construction of a desalination demonstration plant. Since 1962, Webster's municipal water supply has been primarily made up of the product water from a 250,000 gpd electrodialysis facility. The purpose of the study was to compare the municipal use of the water before and after the changeover from brackish water to a municipal supply of reduced mineral content. More specific objectives were to compute identifiable cost items related to the use of centrally softened brackish water versus the use of demineralized water. Replacement costs were sharply reduced for hot water heaters installed after 1962. Fifteen other S.D. communities were likewise surveyed. Agreement among users was not clearly unanimous. To the native housewife softness was more important than generally low mineral content. Institutional and commercial users distinctly preferred the demineralized water. (Bovet-Office of Saline Water)

IRRIGATION IN KENTUCKY AS AFFECTED BY THE LAW OF RIPARIAN RIGHTS,
Hugh C. Evans.
Ky L J, Vol 40, No 4, p 423-433, May 1952. 11 p, 32 ref.

Descriptors: *Kentucky, *Riparian rights, *Irrigation, *Reasonable use, Natural use, Prior appropriation, Natural flow doctrine, Artificial use, Irrigation water, Legal aspects, Usufructuary right, Water law, Judicial decisions, History, Obstruction to flow, Remedies, Water policy, Irrigation districts, Diversion.
Identifiers: *Common law.

Irrigation is becoming increasingly important to the Kentucky farmer. Recent studies show that present economic conditions may necessitate the expanded use of irrigation in the future. This development will undoubtedly present substantial legal problems arising under the Kentucky law of riparian rights. Although the Kentucky court is committed to the natural flow theory, it has on occasion applied what amounts to a reasonable use theory. Although no decision has distinguished which of these theories will be applied to irrigation, case law seems to suggest that Kentucky will follow a rule somewhere between these two theories. This conclusion is drawn after analyzing in detail the two relevant cases decided by the Court of Appeals of Kentucky. The author proposes various hypothetical cases and suggests what the court would do if presented with such a situation. These examples appear to favor the future legal status of irrigation. It is proposed that a solution employing these existing theories would make unnecessary local statutory adoption of any new doctrine of water use, such as the theory of prior appropriation. REGIONAL DIFFERENCES IN THE IMPACT OF IRRIGATION ON FARM OUTPUT,
Illinois Univ., Urbana; and International Rice Research Inst., Los Banos (Philippines).
J. C. Headley, and V. W. Ruttan.
IN Economics and Public Policy in Water Resource Development, Ames, Iowa State University Press, p 127-149, 1964. 23 p, 2 fig, 3 tab, 5 append, 19 ref. Edited by S. C. Smith, and E. N. Castle.

Descriptors: *Irrigation, *Water allocation, *Economic analysis, *Water resources development, Correlation analysis, Randomness, Investment, Lime, Fertilizer, Humid area, Arid lands, Groundwater, Technology.
Identifiers: *Aggregate production function, *Farm output, *Empirical investment, *Economic growth, Elasticity, Cropland, Cobb-Douglas function, Coefficients, Bias.

This article represents a preliminary report on an attempt to use aggregate production functions to construct estimates of regional differences in the productivity of irrigated cropland. The aggregate production function is discussed with a note of its limitations. Regional production elasticity and marginal productivity estimates are presented and two illustrations demonstrate how the results can be used to assess the impact of irrigation development on the growth of farm output. Statistical estimates of irrigation productivity are given for major agricultural regions in the U.S., indicating reliable quantitative estimates of factor productivity coefficients and marginal productivity estimates in most areas. Only the direct irrigation benefits were dealt with, leaving a need for cost analysis in all areas. Incremental increases in irrigation inputs were studied in both humid and arid regions. The analysis emphasized broad possibilities of substitution among aggregate input categories to achieve given output levels in each region. (Murphy-Rutgers)

IRRIGATION WATER USE IN THE UTAH VALLEY, UTAH,
Central Michigan Univ., Mount Pleasant.
James Hudson.
Chicago, University of Chicago, 1963. 249 p.

Descriptors: *Water supply, *Irrigation, *Economics, *Land use, *Utilities, *Water management, Agriculture, Population, Income, Farms, Climates, Natural flow, Financing, Prices, Costs, Water yield, Irrigation efficiency, Water rates, Reservoirs, Wells, Springs.
Identifiers: *Utah Valley, *Water companies.

This study attempts to describe the water use management practices important to irrigation water use and to canvass the whole range of factors, physical, economic and institutional, which affect water use and the variations of water use in a particular area. It provides an estimate of the actual water use and irrigation efficiencies in the valley. The problems of measurement of efficiency are discussed and the results of different available measures are compared. It examines the conditions in the area which encourage or hinder changes in irrigation water use. Of particular interest to the economist is the section which examines the irrigation water companies as the intermediate step between surface supply and the farmers. (Murphy-Rutgers)

Identifiers: *Agrometeorology, *Israel.

The author presents a brief review of the state of research on micrometeorological and environmental effects in agricultural research in Israel as of 1968. Research is directed toward optimization of water use in irrigated agriculture. Instrumentation was somewhat less sophisticated than that in Europe and the United States. Extensive work was in progress to develop efficient use of windbreaks and greenhouses as well as soil covers to control soil temperature and evaporation and to extend the growing season for high value specialty crops. The author concluded that Israel, with an arid climate and severely limited water supply, could benefit greatly from continued agrometeorological research. (Crouse-Arizona)

Irrigation can be used as a supplement in arid zones as a substitute for natural rainfall to supply soil moisture for growing plants and, sometimes, to control surface temperatures. Subsurface, surface, and sprinkler application methods can be used. Sprinkler methods offer greater uniformity of coverage, frequently at lower application rates. This paper presents a broad review of situations in which sprinkler irrigation should or should not be used. It examines factors that affect system performance and design criteria of which the planner should be aware when designing an irrigation system. Special uses such as fertilizer and pesticide application and frost protection are discussed. The most obvious applications are in arid or semi-arid zones or in areas where natural precipitation is inadequate or unpredictable during the growing season. Since farming is a business, an irrigation system should not be installed unless estimated increase in value of product exceeds direct and indirect costs of installations and operation. Discussion of costs includes suggested depreciation periods for various system components, interest rates, and data for estimating operating and maintenance costs. (Crouse-Arizona)

IRRIGATION IN THE AMU-DAR'YA BASIN: PROGRESS REPORT,
Ann Sheehy.
Central Asian Review, Vol 15, No 4, p 342-353, 1967. 1 map.

Descriptors: *Arid lands, *Irrigation systems, *Irrigation canals, *Canal seepage, *Drainage systems, Land development, Hydroelectric power, Saturated soils.
Identifiers: *Central Asia, *Amu-Dar'ya Basin, U.S.S.R., Aral Sea.

The article, compiled from Russian language newspapers and journals, deals with irrigation developments in the Amu-Dar'ya Basin as reported between 1963 and 1967. Citations of original articles are not always included. The Amu-Dar'ya empties into the Aral Sea. About two-thirds of the average annual flow (70 milliard cubic meters) reaches the Aral Sea, but current plans are to divert almost all of the water for irrigation by 1980. Structures will be multi purpose and also generate electricity, part of which will be used to lift irrigation water where necessary and the rest made available for urban-industrial development. The various projects in operation, under construction and in planning stages are reviewed briefly and individually. Many projects are apparently running behind schedule due to excessive losses from seepage from canals, inadequate provision for drainage of newly developed lands, and inadequate technical knowledge of many farmers as to efficient use of irrigation water. Various measures to correct these short comings are discussed briefly. As more and more flow is diverted to irrigation the Aral Sea will shrink. This will have disastrous effect on fishe-

ries and other industries presently located along the shore. The concensus is that this will be outweighed by the value derived from the eight million hectares of land that will be brought under irrigation. Climatological experts discount the threat of serious effects due to shrinkage or disappearance of the Aral Sea. (Crouse-Arizona)

SOIL AND WATER CONSERVATION DISTRICTS LAW.

SC Code Ann secs 63-51 thru 63-165 (Supp 1968).

Descriptors: *South Carolina, *Conservation, *Erosion control, Legislation, Soil conservation, Water conservation, Demonstration farms, Demonstration watersheds, Land management, Contour farming, Soil management, Erosion, Farm management, Land development, Land use, Cover crops, Cultivation, Sediment control, Terracing, Water management, Water resources, Water resources development, Watershed management, Water utilization, Flood control, Fallowing.
Identifiers: Conservation districts.

A State Soil and Water Conservation Committee is composed of one supervisor from each of the state's five soil conservation districts, and its function is to coordinate and assist the supervisors of these districts. Provisions are made for the formation of new districts by petition of landowners to the Committee to hold a referendum. If approved by the referendum, application is filed with the Secretary of State who files and records the application. Similar procedures allow for including additional territory within existing districts, for subdividing districts, and for their discontinuance. Upon discontinuance, regulations made by the district are nullified, but the Committee is substituted as party to all contracts. Three supervisors are elected by the voters in each district for three-year terms and are removable for malfeasance only. Districts may conduct surveys, research, and demonstration projects in cooperation with other federal or state agencies; carry out preventive and control projects for soil and water; aid other agencies; and develop comprehensive plans for soil and water conservation. A board of adjustment is established to hear hardship petitions concerning land use regulations in each district. (Douberley-Florida)

ENGINEERING PHASES OF LAND TREATMENT RELATED TO INCREASING WATER-USE EFFICIENCY AND STORAGE EFFICIENCY RAINFALL,
Nebraska Univ., Lincoln.
Howard D. Wittmuss.
Nebr Univ Water Resources Res Inst Proj Completion Rep, July 1969. 11 p, 1 fig, 1 tab. OWRR Proj No A-003-NEB.

Descriptors: *Land management, *Soil conservation, *Water conservation, *Terracing, Erosion control, Drainage, Mulching, Cover crops, Water storage, Soil temperature, Soil moisture, Electrical resistance.
Identifiers: Experimental watersheds.

Three systems of parallel steep backslope terraces were installed, field tested and evaluated as a new and improved soil and water conservation practice compatible with the operation of modern large scale, high speed farm machinery. A till-planter and system of mulch tillage were developed and used with the improved conservation systems. Runoff, soil loss and peak rate of runoff were reduced 1/3, 9/10 and 37/38 respectively, for the new conservation systems compared to a similar non-conservation watershed. Improvements in tile line design, in the size and arrangement of perforated openings in the terrace outlets, and in the method of sealing the terrace ridge to seepage of water along the tile line were recommended. A sediment sampler which would automatically collect a representative runoff sample was designed, constructed and field tested. A power series formula was developed for predicting changes in electrical resistance with changes in soil temperature. The electrical resistance blocks can be used to determine the soil moisture level in a soil over a wide range of temperatures. A theory and predication formula was developed for determining head pressure and friction losses for pipeline joints in tile. The potential evapotranspiration was determined for bromegrass under different levels of soil moisture stress for dryland conditions. (Knapp-USGS)

Descriptors: *Indiana, *Levees, *Administrative agencies, Maintenance costs, Costs, Assessments, Weed control, Weeds, Washouts, Pumping, Legislation, Condemnation, Earthworks, Embankments, Maintenance, Repairing, Legislation, Administration.
Identifiers: Negligence, Penalties (Civil).

The committee placed in charge of a levee has full power to repair and maintain the same and may change the levee's location when necessary. Repair costs are generally assessed against the lands benefitted thereby; however, where such repairs are rendered necessary due to the negligence of a landowner or occupant, costs are assessed against his lands alone. The committee may fence levees and adopt measures to keep levees free from weeds. Upon petition by the landowners protected by a levee, the committee may make additions thereto. The committee may also, upon written request by the protected landowners, take all necessary steps to prevent the encroachment of any stream and the washing away of the stream banks. The committee may pump out or take necessary steps to remove water collected on lands protected by such levee. Land necessary for the maintenance of an authorized levee may be obtained by purchase or condemnation. It is unlawful to drive over or upon any levee. (Marsee-Florida)

The nation as a whole is in the early stages of a water crisis. Florida, however, has sufficient water resources to serve the needs of her citizens for at least the foreseeable future, provided that this resource is properly utilized. It is strongly recommended that a master plan for water resources development be formulated at once. Such a formulation requires adequate funds for research and a central state agency with authority to represent the state in all water use determinations. Planning must be based on hydrologic units with political considerations subordinated to scientific and aesthetic exigencies. Pollution abatement programs must be implemented at once. Planning for state acquisition and development of shoreline should be a part of any long-range water use program in Florida. Legal doctrines must be formulated which will secure to the public at large access rights in privately owned navigable waters. There is a need for legislation to regulate consumptive uses of water and to create hydrologically sound water management districts. Finally, investigations should be made concerning the feasibility of water movement from North Florida to the population centers of South Florida. (See W70-00527). (Wheeler-Florida)

REAL PROPERTY--EASEMENTS--CONSTRUCTION OF INSTRUMENT GRANTING RIGHT OF FLOWAGE,
George A. Kronenberg.
Ala L Rev, Vol 14, No 2, p 463-470, Spring 1962. 8 p.

Descriptors: *Alabama, *Boundaries (Property), *Water rights, *Riparian rights, Legal aspects, Judicial decisions, Dam construction, Dams, Overflow, Lakes, Drainage, Easements, Fishing, Contracts, Navigable waters, Streams, Boating, Swimming, Recreation, Natural streams, Water law, Impounded waters, Ownership of beds, Water utilization, Non-navigable waters, Preferences (Water rights).
Identifiers: *Easements of flowage, Easements appurtenant, Easements in gross, Water privileges.

In Hill v Davis, 130 So 2d 39 (Ala 1961), the plaintiff dammed a branch on his property and obtained an easement of flowage from the defendant. Litigation ensued when the defendant built a fence along his boundary while the lake was temporarily drained. The appellate court held that the interpretation placed upon contracts by the parties and practiced by them will be accepted by the court, and that the right to take fish in any water which is not navigable follows the ownership of the water, if that is separated from the ownership of the soil. Since the lake had been used by the plaintiff as a commercial fishing lake for thirty years prior to the time when the defendant built his fence, the court found that the parties had interpreted the easement of flowage as including fishing rights. After the law of easements is considered, it is concluded that what was here granted was an easement appurtenant. An analysis of cases leads to the conclusion that in interpreting clear and unambiguous grants the weight of authority is to the effect that rights of boating and fishing are not incidental to an easement of flowage and must be specified in the grant; it is noted that the court could have reached the same result on the basis of prescriptive use. THE NAVIGATION SERVITUDE AND JUST COMPENSATION--STRUGGLE FOR A DOCTRINE,
Richard W. Bartke.
Oregon L Rev, Vol 48, No 1, p 1-44, Dec 1968. 44 p, 194 ref.

Descriptors: *Condemnation, *Eminent domain, *Navigable waters, *Federal government, Condemnation value, Right-of-way, Water rights, Easements, Legal aspects, Cost repayment, Compensation, Local governments, State governments, Federal Power Act, Federal-state water rights conflicts, Navigation, Administrative agencies, Admiralty, Federal jurisdiction, United States.
Identifiers: *Navigation servitude, Commerce power.

The federal interest in navigable waters or 'navigation servitude' is a proprietary one. The development of the concept of navigation servitude is traced from early holdings of the Supreme Court on the commerce power and admiralty jurisdiction granted the federal government in the Constitution. Past and present attitudes of the courts in awarding compensation for condemned lands adjoining navigable waters is examined. The most recent court decisions indicate that compensation will be based upon the government's interest in the flow of the stream in question, not the type of improvement or special adaptability of the land involved. Condemnation by local and state governments and private bodies holding licenses from the Federal Power Commission is also discussed. In these proceedings the licensees should be treated as is the United States in regard to compensation awards and collection of charges for use of assets in the public domain. The author urges development of a comprehensive doctrine, based upon the proprietary nature of navigation servitude, to replace the case by case approach used thus far in solving these water rights problems. (Kelly-Florida)

REAL PROPERTY: DISPOSITION OF DIFFUSED SURFACE WATERS IN NORTH CAROLINA,
William P. Aycock.
NC L Rev, Vol 47, No 1, p 205-218, Dec 1968. 14 p, 81 ref.

Descriptors: *North Carolina, *Surface waters, *Surface runoff, *Riddance (Legal aspects), Surface drainage, Repulsion (Legal aspects), Judicial decisions, OBSTRUCTION TO FLOW, Alteration of flow, Diversion, Natural flow doctrine, Reasonable use, Relative rights, Streamflow, Watercourses (Legal), Natural streams, Drainage.
Identifiers: Civil law, Common enemy rule.

Surface water is defined as that water derived from precipitation or from springs, which is diffused over the surface of the ground. It is distinguished from water flowing into a natural watercourse or forming an identifiable water body. Three basic rules have developed in various jurisdictions concerning disposal of surface waters by landowners. These are: (1) the civil law rule, which requires continuation of natural drainage conditions through imposition of servitudes on lower landowners; (2) the common enemy rule, which permits a landowner to obstruct surface flow without liability; and (3) the reasonable use rule, which imposes liability only for unreasonable alteration of flow. North Carolina early adopted the civil law rule regarding surface water disposal. An analysis of cases reveals some modification of that rule to permit artificial drainage into a natural watercourse, even where acceleration and increase in flow occur. In view of the current trend toward industrialization and urbanization, the author predicts further modification by North Carolina courts to meet future problems. (Kelly-Florida)

THE APPROPRIATION OF PROPERTY FOR LEVEES: A LOUISIANA STUDY IN TAKING WITHOUT JUST COMPENSATION,
Richard P. Wolfe.
Tul L Rev, Vol 40, No 2, p 233-288, Feb 1966. 56 p, 223 ref.

Descriptors: *Louisiana, *Condemnation, *Condemnation value, *Levees, Compensation, Right-of-way, Easements, Eminent domain, Judicial decisions, Legal aspects, Land tenure, Land appraisal, Land use, Flood control, Flood protection, Dikes, State jurisdiction, Federal government, Mississippi River, Public rights, Boundaries (Property), Riparian rights, Navigable rivers.

Governmental authorities in Louisiana have experimented with different methods of obtaining lands for levee construction and of financing levee systems. After surveying the historical development of Louisiana's levee systems, the author concludes that the scope of levee construction has so increased that the traditional method of taking lands is no longer justifiable. The doctrine of appropriation under riparian servitude is grounded in civil law concepts inherited by Louisiana from France and Spain. The author related the doctrine to the state's exercise of its police power by which land is taken for the public welfare without compensation. The courts have rationalized appropriation both as an exercise of police power and as an application of the reserved-right theory (by which the state retains a servitude in all riparian land grants). The author notes the inadequacy of the compensation that may be given, discusses the unclear status of the appropriated land and the broadness of the power to appropriate, and questions the constitutionality of the appropriation doctrine. (Kelly-Florida)
W70-00562

THE APPROPRIATION OF PROPERTY FOR LEVEES: A LOUISIANA STUDY IN TAKING WITHOUT JUST COMPENSATION,
Richard P. Wolfe.
Tul L Rev, Vol 40, No 2, p 233-254, Feb 1966. 56 p, 223 ref.

Descriptors: *Louisiana, *Condemnation, *Compensation, *Levees, Flood control, Mississippi River, Administration, Maintenance, Planning, State jurisdiction, Federal government, Public health, Public benefits, Flood protection, Land tenure, Land use, Riparian rights, Riparian land, Severance, Legal aspects, Banks, Public rights.

Examination of the historical development of financing and planning levees in Louisiana reveals that originally private riparian landowners were responsible for maintaining levees on their lands. Levee districts were later established and continue to administer the levee system, subject to technical advice from state or federal engineers. The districts appropriate land or levee sites without payment of just compensation under the doctrine of appropriation under riparian servitude. Other states take land for these purposes via eminent domain, but Louisiana traditionally has held that construction of levees on private property is a regulation of the owner's use of the land in the interest of public safety, not a use of the owner's land for the public. The appropriation doctrine is further justified under the reserved-right theory. At common law beds of tidewater rivers are owned by the sovereign. Under the civil law of France and Spain, however, rivers belong to all men in common, and the banks, though owned by riparian landowners, were subject to public use or servitude. Louisiana adheres basically to the civil law rule, limiting its application to navigable rivers and to flood control. (Kelly-Florida)
W70-00563

THE APPROPRIATION OF PROPERTY FOR LEVEES: A LOUISIANA STUDY IN TAKING WITHOUT JUST COMPENSATION,
Richard P. Wolfe.
Tul L Rev, Vol 40, No 2, p 255-288, Feb 1966. 56 p, 223 ref.

Descriptors: *Louisiana, *Levees, *Condemnation, *Compensation, Land tenure, Eminent domain, Easements, Condemnation value, Land appraisal, Riparian land, Riparian rights, Ownership of beds, State governments, State jurisdiction, Civil law, Flood control, Navigable rivers, Reasonable use, Relative rights, Appropriation, Sites, Beds.
Identifiers: *Retained-right theory, Constitutional law, Civil law.

Using either police power or the reserved-right theory as justification, the appropriation doctrine permits taking of land for levee sites with no compensation. Statutes permit compensation for the assessed value of the land, but the author contends that compensation must be for fair market value to be constitutionally just. The status of land taken is unclear under Louisiana case law. There is some question as to whether land located on the river side of a levee is part of the bed unless it is inundated. Title to land not part of the bed is retained by the original owner. The scope of the power to take beyond adjoining riparian lands has been extended to include all land reasonably necessary in

the situation. The land taken must be used solely for flood control on the adjoining river. The constitutionality of the appropriation doctrine is questioned when it is based upon the retained-right theory due to the lack of title chain from the state to much private land, inclusion of land not directly adjoining a river, inadequate compensation for improvements, and lack of judicial review. (Kelly-Florida)

COMPENSATION FOR THE RIGHT OF ACCESS TO NAVIGABLE WATERS,
Leighton S. Houck.
Wash and Lee L Rev, Vol 26, No 1, p 136-143, Spring 1968. 8 p, 29 ref.

Descriptors: *Kentucky, *Riparian rights, *Riparian land, *Access routes, Right-of-way, Condemnation, Eminent domain, Judicial decisions, Navigable waters, Legal aspects, Water law, Compensation, Condemnation value, Governments, Public benefits, Public rights, Shores, Coastal structures, Damages.

According to a recent Court of Appeals of Kentucky decision, riparian landowners have the right of a reasonable access to the entire body of water on which their land borders. Such a right has value, and before the state may take or impair such right, it must pay the owner just compensation therefor. There is universal agreement among both state and federal courts that a riparian landowner must be compensated for any actual physical encroachment by the government. These courts, however, do not agree as to whether there should be recognized any right of access at all, even ingress and egress, as a valuable property right and, if so recognized, the extent of that right. Jurisdictions which do recognize the right of access as a valuable property right nevertheless deny compensation if the governmental action is for the purpose of improving navigation. Rather than utilizing rigid doctrinaire concepts, the court looked first at the individual's investment in the land and then weighed this interest against the demands of commerce. Thus, by applying a test of fairness, the fact that a proper governmental function is being performed will no longer by itself be a basis for denying compensation. (Schram-Florida)
W70-00566

THE RIGHT OF ACCESS TO NAVIGABLE WATERS--COMPENSABILITY UNDER EMINENT DOMAIN,
Thomas C. Spencer.
Wash and Lee L Rev, Vol 25, No 2, p 323-328, Fall 1968. 6 p, 22 ref.

Descriptors: *Access routes, *Riparian rights, *Compensation, *Eminent domain, Public benefits, Riparian land, Navigable waters, Condemnation value, Damages, Water law, Judicial decisions, Legal aspects, Governments, State governments, Condemnation, Navigation, Federal government, History.

The federal rule governing compensation for taking a riparian landowner's access to navigable waters for a public use is that no compensation need be given if there is no physical encroachment upon or taking of land and if the governmental act is to improve navigation. This has been extended to make the federal government immune from making compensation for nearly any act so long as there is no physical encroachment upon the land. A majority of the states follows the rule that if the work is not to aid navigation, the riparian landowner may recover for any right lost or damaged. Rather than expanding the navigational servitude immunity, however, some of these states have said that the right of access is a general right held by the public which can be taken for the good of the public in general. A minority of states find that there can be no private rights in the public domain and therefore, no compensation is ever necessary. The right of access to navigable waters is a public right held in trust by the state. Thus, either as a rule or through interpretations, the tendency today is towards not compensating riparian owners. This is justified by recognizing that if compensation were required, the cost of public improvements would be prohibitive, and commerce would be considerably impeded. (Schram-Florida)

WATER--AS A SPECIES OF PRIVATE PROPERTY--THE ILLINOIS VIEW,
John E. Cribbet.
Ill B J, Vol 47, No 5, p 449-477, Jan 1959. 29 p, 77 ref.

Descriptors: *Illinois, *Riparian rights, *Usufructuary right, *Water rights, Prior appropriation, Water law, Natural flow doctrine, Natural flow, Water pollution, Consumptive use, Alteration of flow, Navigable waters, Prescriptive rights, Reasonable use, Navigation, Drainage.
Identifiers: Property rights.

Whether water is a property right is a question answerable only after an understanding of differing water laws. Western states use agencies to supervise a prior appropriation system of vested water rights based on an appropriation of water by the earliest user. Illinois follows the common-law riparian doctrine of water rights wherein riparian owners along watercourses have a usufruct in water as it passes their land. This right of use is protected as a vested property right subject to a public easement for navigation. Riparians have equal rights to use the passing water, but use by one riparian cannot deprive others of an equal opportunity to the water. Riparian rights are based on the natural flow doctrine of watercourses and modified in cases of pollution and consumption to reasonable use test. Illinois follows the Roman Law of natural drainage, modified and augmented by a comprehensive Drainage Code. Recent legislation establishing water study and control boards reveals Illinois' concern with its water problems. (McDonough-Florida)

CIVIL LAW PROPERTY--BEDS OF NAVIGABLE WATERS--SUSCEPTIBILITY OF PRIVATE OWNERSHIP.

La L Rev, Vol 14, No 1, p 267-273, Dec 1953. 7 p, 27 ref.

Descriptors: *Louisiana, *Navigable waters, *Ownership of beds, *Public rights, Lakes, Beds under water, Judicial decisions, Legislation, Land tenure, State governments, Patents, Civil law.
Identifiers: Private rights.

Since 1812, beds of navigable waters have been regarded as belonging to the state as public lands. Public lands were traditionally classed as either susceptible or insusceptible of private ownership, with navigable stream or lake beds being insusceptible of such ownership. The legislature has consistently excluded beds of navigable waters in legislation authorizing disposition of public lands. The judiciary announced its adherence to the insusceptibility view in the landmark case of Miami Corporation v State, 186 La 784, 173 So 315 (1936), based on principles of public policy. Yet, in Humble Oil Company v State Mineral Board, 223 La 47, 64 So 2d 839 (1953), the court did not even acknowledge this principle of insusceptibility. The court did not consider the state's contention that the conveyance of the tract of land which included a navigable lake could not have passed title to the bed of the lake since not authorized by statute. The court merely relied on Act 62 of 1912, which placed a 6 year limitation on suits by the state to annul patents. In so doing, the court applied the act to the transaction in question without inquiry into the statutory authority of the patent alienating the public land. In view of the conflicting decisions, a re-examination of the Humble Oil decision in future cases seems warranted. (Harris-Florida)

WATER BOUNDARIES,
Fred K. Read.
Ky State B J, Vol 8, No 4, p 10-12, Sept 1944. 3 p.

Descriptors: *Kentucky, *Ohio River, *Riparian rights, *Boundaries (Property), Accretion (Legal aspects), Avulsion, Bank erosion, High water mark, Low water mark, Legal aspects, Ownership of beds, Navigable waters, Non-navigable waters, Tidal waters, Judicial decisions, Legislation, Cities, Banks, Beds, Riparian land.
Identifiers: *Common law.

Under English common law, the beds and shores of all tidal waters were owned by the crown. All other lands beside and under the waters were susceptible of private ownership, regardless of the navigability of the waters. Although most states differ, Kentucky allows the title to the banks and beds of all rivers and streams, regardless of navigability, to vest in the abutting property owner. This is subject only to the public easement in navigation. A riparian landowner owns to the center of the stream and is entitled to any accretions by avulsion or reliction, and must accept any loss due to erosion or dereliction. In the case of the Ohio River, even though Kentucky's ownership extends to the far bank, riparian owners in Kentucky still own only to the center line. This rule also applies to municipalities, except for third-class cities who, by statute, had their boundaries extended to the low water mark of the opposite shore. (Schram-Florida)

DETERMINATION OF RIGHTS TO REAL PROPERTY ALONG THE MISSOURI RIVER IN CONNECTION WITH RIVER STABILIZATION,
Robert M. Underhill.
Iowa L Rev, Vol 42, No 1, p 58-62, Fall 1956. 5 p, 28 ref.

Descriptors: *Iowa, *Missouri River, *Accretion (Legal aspects), *Boundaries (Property), Avulsion, Stabilization, Judicial decisions, Legislation, Interstate compacts, Riparian rights, Legal aspects, Ownership of beds, Riparian land, Water law, High-water mark, Stream stabilization, Channels, Meanders, Sand bars, Islands, Federal government.

Stabilization of the Missouri River channel by the United States Corps of Engineers will cause many legal problems. Questions will arise relative to the western boundary of Iowa, and pertaining to private titles to lands which hitherto were accretions, islands, or submerged lands beneath the Missouri River. A solution to the Iowa boundary problem has been accomplished by an agreement between executive authorities of Iowa and Nebraska. This, together with reciprocal legislative enactments, seemingly settle the western boundary of Iowa along the stabilized channel of the Missouri River. Riparian owners of land along the banks of a navigable stream hold title to accretions to their lands to the high-water mark of the stream. Land suddenly annexed to the state's domain through avulsion, however, is not susceptible to riparian ownership. When such avulsion creates sandbars and islands, conflicts between riparian owners and Iowa will arise. Because a substantial amount of land will be added to Iowa by reason of the channel stabilization, claims of private individuals based upon adverse possession and the doctrine of prescription will be made. An additional area of controversy will be the apportionment of frontages among the riparian owners along the new river course. (Schram-Florida)

REAL PROPERTY--WATER RIGHTS--PUBLIC RIGHTS OF FISHING AND NAVIGATION OVER FLOODED LANDS.
Vand L Rev, Vol 5, No 3, p 669-671, Apr 1952. 3 p, 21 ref.

Descriptors: *Fishing, *Floodwaters, *Relative rights, *Land tenure, Water rights, Real property, Navigable waters, Navigation, Flooding, Legal aspects, Riparian rights, Riparian land, Boating, Hunting, Public rights, Land, Sport fishing, Ownership of beds, Recreation, Usufructuary right, Avulsion, Tidal waters.
Identifiers: Submerged lands.

In Bohn v Albertson, 238 P2d 128 (Calif App 1951), the lessees of a flooded tract of land sought to enjoin the public from fishing thereon. The court held that the public had the right to fish and boat. Once title to land is acquired, it is not affected when the property becomes submerged under navigable waters by avulsion. Although the landowner may drain and reclaim the land, the public has an easement of navigation in such waters. The fact that at common law the public right of fishing was coextensive with the right of navigation in state-owned, tidal waters has led some American jurisdictions to disregard the separate nature of these rights. These jurisdictions have extended the fishing right to all navigable waters, regardless of who owns the stream bed. However, the majority of courts hold that the right to fish and hunt is an incident of land ownership, exclusive in the riparian owner. Where private land is inundated, cases have unanimously allowed the owner the private right of fishing. The view of the instant case is, however, consistent with the public nature of inland fishing. PROVISIONS AS TO DITCHES, DRAINAGE, AND RECLAMATION.

Ky Rev Stat Ann secs 269.210-269.270 (1963).

Descriptors: *Kentucky, *Drainage districts, *Drainage programs, *Local governments, Legal aspects, Construction, Maintenance, Eminent domain, Condemnation, Costs, Taxes, Assessments, Legislation, Inspection, Construction costs, Cities, Obstruction to flow.

Any drainage corporation may extend or construct additional ditches to facilitate drainage and may use the power of eminent domain to condemn needed lands. Upon petition of the corporation and after hearing, the county court may order the extension by the corporation. The landowner in any county of 25,000, through whose land a non-navigable stream has its natural outlet or a ditch or drain has been constructed, must keep the same free from obstructions. The county engineer shall inspect such streams and ditches and notify the owner of any obstructions. If the owner fails to remove said obstructions, the engineer shall cause them to be removed and the cost will become a lien upon the land. Any person, upon approval of the drainage board, may petition the county court to be removed from a drainage district. The county court for any county may establish a county-wide surface water drainage district to be paid for by county taxes and may acquire all necessary rights-of-way by purchase or condemnation. (Darragh-Florida)
W70-00590

DRAINAGE MAINTENANCE AND REPAIR DISTRICTS.
Ind Ann Stat secs 27-243 thru 27-250 (1960).

Descriptors: *Indiana, *Drainage districts, *Ditches, *Administrative agencies, Assessments, Maintenance costs, Governments, Legislation, Legal aspects, Adjudication procedure, Construction costs, Drainage, Financing, Administration, Maintenance, Repairing, Drainage systems.

Where a public ditch or drain has been or shall be constructed pursuant to the order of any circuit or superior court or board of county commissioners, the owners of assessed real estate, who would benefit by the construction of such drain or ditch, may file a petition with the circuit or superior court in their county seeking the establishment of a Drainage Maintenance and Repair District. When such proposed district includes a city or town, the common council or town board of the city or town may sign the petition on behalf of landowners within that city or town. After a hearing and opportunity for contest by landowners within the proposed district, the court may establish such proposed district. Commissioners appointed by the court must maintain such ditch or drain in proper condition and are authorized to hire all labor and purchase all material necessary therefor. Lands benefited by such maintenance are assessed in advance for the costs thereof. Upon petition by landowners, any maintenance district under this act may be dissolved by the court which established it. (Marsee-Florida)

DRAINS: RIGHT-OF-WAYS--OBSTRUCTIONS--CROSSINGS--CONNECTIONS.
Ind Ann Stat secs 27-2301 thru 27-2310 (Supp 1968).

Descriptors: *Indiana, *Administrative agencies, *Obstruction to flow, *Easements, Drainage, Drainage systems, Drains, Ditches, Planning, Right-of-way, Construction, Maintenance, Relocation, Levees, Bridges, Culverts, Legislation, Public utilities, Bridge construction, Highways, Railroads.

Authorized personnel from the county drainage board have a right of entry over and upon lands lying within 75 feet of any legal drain. Unless approved by the county drainage board in the county in which the drain lies, objects, crops, and trees along the easement run the risk of removal or damage. Obstructions are to be removed from drains and any needed repairs made immediately either by the landowner causing the obstruction or by the board. The cost of repairs made by the board may be assessed against a landowner causing the harm. Pipeline companies, public utilities, or other persons may be required, by suit if necessary, to relocate their equipment or repair damages caused by them to any legal drain. Proposed drains within 300 feet of any levee must be approved by the Indiana Flood Control and Water Commission. Plans may be made for the construction of culverts or bridges or the improvement of existing ones where drains will cross public highways or railroad right-of-ways. The construction of drains shall not prevent owner ingress or egress to his land via proper crossings. The connection of private drains with legal drains must be approved by the Stream Pollution Board. (McDonough-Florida)

THE PROPOSED SOLWAY FIRTH BARRAGES: A REVIEW OF THE GEOLOGICAL AND GEOTECHNICAL ASPECTS,
Ministry of Agriculture and Water, Riyadh (Saudi Arabia).
J. A. Kay.
Eng Geology, Vol 3, No 4, p 265-306, Oct 1969. 42 p, 12 fig, 8 tab, 64 ref.

Descriptors: *Dams, *Water supply, *Estuaries, Hydrologic data, Geology, Hydrogeology, Stratigraphy, Engineering geology.
Identifiers: England, Solway, Firth.

Barrages are proposed to create freshwater lakes in Solway Firth, England. The specific geology of each of the proposed sites is reviewed and the inadequacy of present information emphasized. Geotechnical problems which might arise during and after construction of the barrages are summarized. The possible sources of various types of constructional materials are indicated. Finally, methods are suggested which would provide much of the information essential for an accurate assessment of the various proposals for the area. (Knapp-USGS)

RIVER AND HARBOR IMPROVEMENTS.

33 USCA secs 558C, 565, 567B (1957).

Descriptors: *United States, *Rivers and Harbors Act, *Easements, *Interstate compacts, Navigable rivers, Right-of-way, Federal government, State governments, Flood control, Pollution abatement, Administrative agencies, Legislation, Legal aspects, Tennessee Valley Authority Project.
Identifiers: Secretary of the Army.

The Secretary of the Army is authorized to grant easements for rights-of-way across lands acquired by the United States for river, harbor, and flood control improvements, provided that such rights-of-way shall be granted only upon the Secretary's finding that the same will be in the public interest and will not substantially injure the interest of the United States. Such rights-of-way may be annulled by the Secretary for failure to comply with the terms of the grant. The Secretary's authority does not extend to lands held by the Tennessee Valley Authority. Any persons or corporations may improve, at their expense, any navigable river upon the approval of plans therefor by the Secretary and by the Chief of Engineers of the Army. Such plan must conform with the general plan of the government improvements and must not impede navigation. Congressional consent is given to Maryland, West Virginia, Virginia, Pennsylvania, and the District of Columbia to form a compact to create a Potomac Valley Conservancy District and to establish an Interstate Commission on the Potomac River Basin. No right or jurisdiction of the United States in this area is to be affected thereby. (Carruthers-Florida)

CONOBRE V FRITSCH (NATURAL WATERCOURSES).
111 NE2d 38-41 (Ct App Ohio 1952).

Descriptors: *Ohio, *Watercourses (Legal), *Closed conduit flow, *Obstruction to flow, Spring waters, Judicial decisions, Streamflow, Pipes, Tiles, Swimming pools, Subsurface waters, Underground, Water sources, Channel flow, Channels, Farms, Farm ponds, Diversion, Pipe flow, Natural flow, Overland flow, Subsurface flow.

Plaintiffs sought to enjoin the owners of a farm, on which a stream originated from an underground spring, from obstructing, diverting, or diminishing the flow of water from the stream on the ground that the stream was a natural watercourse. The plaintiff owned a commercial swimming pool which utilized water from the stream. The issue was whether such spring and its consequent overflow into a channel, even though for a great part of its distance encased in tile pipe, created a natural watercourse. The court held that such spring and stream did constitute a natural watercourse and that the parties had only such rights as are given to riparian owners. The court noted that the stream, encased in the tile pipe, had run in the same direction for more than fifty years. 'Watercourse' was defined as a stream, usually flowing in a particular direction in a definite channel, having a bed, banks, or sides and discharging into some other stream or body of water. The injunction was granted. (Marsee-Florida)

RIGHTS OF WAY FOR DRAINAGE.

SC Code Ann secs 18-51 thru 18-58 (1962).

Descriptors: *South Carolina, *Drainage, *Ditches, *Surface drainage, Damages, Legal aspects, Surface waters, Drainage practices, Drainage systems, Water control, Surface runoff, Legislation, Land development, Land management, Land use, Distribution systems, Excavation, Compensation, Construction, Adjudication procedure.

Any person who owns lands which can only be drained over the land of another is allowed under certain circumstances to enter the property of such owner and construct or cut such waterway as is necessary for this purpose. Provisions are included to deal with objections of the adjacent landowner to such construction. Each landowner selects a referee to represent his interests in the dispute. The two referees so appointed will select a third, and the three of them will have authority to fix the location and just compensation for such waterway by a written verdict. Appeal from their decision lies in magistrates' courts. Right to open and repair such waterway commences immediately upon payment of the compensation thus ascertained. Failure of the adjacent owner to appoint a referee allows the referee appointed by the person seeking to construct the waterway to proceed by himself as if all three were meeting. (Johnson-Florida)

COMPENSATION FOR TAKING OF FLOWAGE EASEMENTS BY CONDEMNATION,
Robert Corontzos.
Mont L Rev, Vol 23, No 2, p 212-221, Spring 1962. 10 p, 78 ref.

Descriptors: *Easements, *United States, *Compensation, *Condemnation, Judicial decisions, Legal aspects, Eminent domain, Federal government, Land use, Real property, Dams, Property values, Adjudication procedure.
Identifiers: *Flowage easements.

The case of United States v Virginia Electric and Power Company, 365 U S 624 (1961), dramatically presented the problem of determining whether or not flowage easements are 'private property', the taking of which requires just compensation. However, in the instant case, the court did not discuss the problem as involving any question of whether or not 'property' as such was present, but rather based its discussion solely on considerations of 'valuation'. Courts have been asked on numerous occasions to define 'property' under particular fact situations. Under the fifth amendment, 'property' has been held to be a group of rights inhering in a citizen's relations with others which results in certain powers over a physical thing. Whether there is a taking must be determined in light of the particular facts and circumstances involved. A private easement has generally been held to be 'property' in the constitutional sense. The holder must have a real interest in the property. Qualified rights must be considered in light of the qualifying conditions under which they exist. A careful reappraisal of the problems involved in this area should be undertaken by the judiciary. (Heckerling-Florida)

PUBLIC RIGHT AND THE RULE OF NO COMPENSATION,
Robert R. Rossi.
Notre Dame Lawyer, Vol 44, No 2, p 236-251, Dec 1968. 16 p, 112 ref.

Descriptors: *Compensation, *Navigation, *Riparian rights, *Eminent domain, Riparian waters, Water rights, Navigable waters, Obstruction to flow, Reasonable use, Water law, Navigable rivers, Bridges, Dams, Damages, Federal government, State governments, Judicial decisions, Legal aspects.
Identifiers: *Navigation servitude.

Riparian owners are injured when downstream obstacles, constructed with legislative authorization, cutoff their navigation rights. Historically, riparians have had the rights of access to the adjacent navigable waters and of navigation. Present case law denies the riparian normal eminent domain compensation for interference with these rights by characterizing 'access' as a compensable private right and 'navigation' as a non-compensable public right. Although liberalizing influences have attempted to construe obstructions to access to navigable waters as compensable, courts are reluctant to find a constitutional 'taking' unless the obstruction causes damages to the riparian different in kind and degree than that sustained by the general public. Further, the concept of the navigation servitude permits the taking of private property (access) without compensation in exercise of the navigation power. This rule is followed by state and federal governments in the construction of bridges and dams in aid of navigation. Critics of this rule analogize the stranded riparian's situation with that resulting from a highway access taking. Yet compensation is allowed for the latter. Federal and state legislation allowing compensation seems the only viable solution for the injured riparian owner. (McDonough-Florida)
W70-00785

COMMISSIONERS OF HEALTH AND DRAINAGE IN CERTAIN COUNTIES.

SC Code Ann secs 18-71 thru 18-76 (1962).

Descriptors: *South Carolina, *Drainage, *Administrative agencies, *Local governments, Ditches, Damages, Legal aspects, Surface drainage, Surface waters, Drainage practices, Legislation, Water control, Drainage systems, Water pollution, Water pollution control, Relation, Estimated costs, Assessments, Compensation, Public health.

The governing bodies of enumerated counties may act as commissioners of health and drainage. Such commissioners hear arguments and decide upon just compensation in disputes where a landowner desires to drain his land by cutting a necessary outlet through adjoining lands. When a third of the landowners upon a watercourse desire to drain their lands into such watercourse, the commissioners have authority to let contracts for accomplishment of this purpose and levy assessments apportioned according to the amount of benefit received by each landowner. If a watercourse is deemed unsanitary and a hazard to public health, the commissioners may proceed to drain the watercourse after receiving estimates of the cost. If the expense involved is greater than a reasonable assessment to the landowners, the commissioners may petition the judge of the circuit court and upon his approval pay the excess costs from the county revenue. (Johnson-Florida)
W70-00788

RIPARIAN RIGHTS IN ARTIFICIAL LAKES AND STREAMS,
Alvin E. Evans.
Mo L Rev, Vol 16, No 2, p 93-117, Apr 1951. 25 p, 99 ref.

Descriptors: *Missouri, *Riparian rights, *Artificial watercourses, *Judicial decisions, Streams, Lakes, Dams, Prescriptive rights, Boating, Channels, Beds, Fishing, Recreation, Water law, Impounded waters, Obstruction to flow, Drainage, Watercourses (Legal), Diversion, Overflow, Ditches, Water supply, Flooding, Accretion (Legal aspects), Alteration of flow.
Identifiers: *Estoppel, *Reciprocal easements, Implied consent, Statute of limitations.

The situations where an owner of land bordering on a stream or lake erects a dam and floods the lands above and where a natural stream is diverted from its original channel into a new one are considered in this article. The subject of inquiry is the riparian rights which may or may not accrue to the owners of land bordering on artificially created lakes and watercourses; the subject is approached through an analysis of judicial decisions dealing with the subject. The courts use three different rationales in finding riparian rights in these cases: (1) if an artificial lake or watercourse is maintained for a sufficient length of time, it should be regarded as natural; (2) each party acquired rights in the property of the other by a similar course of conduct, adverse usage or prescription (the theory of resulting reciprocal easements); and, (3) the plan inaugurating the flowage is deemed to have grown out of mutual understanding and assent (the theory of estoppel). The author concludes from his case analysis that while most jurisdictions find riparian rights where they should, the rationale for the decisions is often poor. (Keith-Florida)

NAVIGABLE WATERS--RIGHT OF RIPARIAN OWNER TO ARTIFICIAL ACCRETION,
Marion W. Smith.
Miss L J, Vol 25, No 2, p 174-175, Mar 1954. 2 p, 10 ref.

Descriptors: *Alabama, *Accretion (Legal aspects), *Riparian land, *Federal government, Avulsion, Judicial decisions, Riparian rights, Dredging, Legal aspects, Boundaries (Property), Beds, Beds under water, Landfills, Land forming, Land, Shores, Boundary disputes, Channel improvement, Land classification, Governments.

The Alabama Supreme Court ruled in State v Bill, 66 So 2d 141 (Ala 1953) that title to fifty-six acres of land, created by dredging and piling against the riparian owner's shoreline, was in the riparian owner because of the doctrine of accretion. At common law, accretion had to be gradual and imperceptible. In this instance it was man-made, rapid and perceptible. The court ruling conflicts with both the common law doctrine of avulsion and established case law which would have vested title in the sovereign. The result, although just, should not have been reached upon the basis of accretion because it was neither gradual nor imperceptible. (Darragh-Florida)
W70-00798

COMMON LAW RIGHTS TO SURFACE WATERS,
Robert S. Stewart.
Notre Dame Lawyer, Vol 21, No 4, p 364-366, June 1946. 3 p, 9 ref.

Descriptors: *Surface waters, *Drainage water, *Repulsion (Legal aspects), *Riddance (Legal aspects), Runoff, Standing waters, Surface runoff, Ditches, Drainage, Drainage systems, Drains, Relative rights, Diversion, Retention, Channels, Land, Overland flow, Rain water, Surface drainage, Water sources, Hydrology, Running waters, Wetlands.

Surface waters are waters that fall from the skies or arise in springs. They diffuse themselves over the surface of the ground following no defined course or channel and are lost by diffusion, percolation, evaporation, or natural drainage. Under the civil law rule, as between upper and lower ground owners, the lower proprietor's land was subject to an easement of natural surface water flow from the upper proprietor's land. Under the common-law rule, a landowner may control both the water falling on his land and that flowing across it. He may refuse to receive water originating on, or flowing over, adjoining property. The retention, diversion, repulsion, or altered transmission of surface water is not actionable even though damage ensues. Courts have often modified the common-law rule to fit each individual case. Some courts have stated that the upper proprietor may not accumulate surface water in a ditch or drain and thereby increase the flow and discharge onto the lower estate; nor may the proprietor change the direction of such water. The true common-law rule seems preferable since modifications of the rule create confusion. (Marsee-Florida)

Descriptors: *Louisiana, *Leases, *Administrative agencies, *Legislation, Conservation, Judicial decisions, Remedies, Dredging, Contracts, Administrative decisions, Shellfish, Natural resources, State governments, Lakes, Riparian rights, Legal aspects, Relative rights, Oysters, Clams.
Identifiers: Injunctions (Mandatory).

In the case of Gorham v Mathieson Alkali Works, 27 So 2d 299 (La 1946), plaintiffs, riparian owners brought suit to enjoin defendant from dredging the bottoms of various lakes. The defendant had been given a lease under a contract from the Department of Conservation to remove oysters and clam shells from the lake bottoms. Plaintiffs contended there was no statutory authority to grant the lease. The appellate court, reversing the trial court, held that the Department did have authority to grant the contracts of lease. The Department was created to protect, manage, and conserve the natural resources of the state. The language of the act is broad but alone does not give the Conservation Commission the right to sell or lease any natural resources. However, when read in conjunction with a 1914 act, which gives the Commission both the right to sell and grant the privilege of taking oyster shell deposits from Gulf Coast waters and the right to make contracts leasing the right to remove such shell deposits, the contracts to lease in the instant case come within the authority granted by statute. CONSTITUTIONAL LAW-NAVIGABLE WATERS-EXTENSION OF THE FEDERAL PREROGATIVE,
Orton A. Jones.
W Va L Rev, Vol 63, No 1, p 59-62, Dec 1960. 4 p.

Descriptors: *West Virginia, *Navigable rivers, *Federal-state water rights conflicts, *Federal jurisdiction, Non-navigable waters, Legal aspects, Hydroelectric plants, Federal government, Oklahoma, Flood control, Regulation, Navigation, Judicial decisions, United States, Watersheds (Basins), Eminent domain, Public benefits, Federal project policy, Federal reclamation law, Compensation, Hydroelectric power, Condemnation value, Jurisdiction, State jurisdiction, Tributaries.
Identifiers: *Hydroelectric franchises, Due process, Grand River, Arkansas River.

In United States v Grand River Dam Authority, 80 S Ct 1134 (1960), the federal government instigated a hydroelectric project on a non-navigable tributary of a navigable river; the project was in a location for which a state agency held a hydroelectric franchise. When the agency demanded compensation for the taking of its rights, the Court of Claims held the government liable. The Supreme Court reversed and held that there is no taking of property when the United States asserts jurisdiction to regulate navigable streams, and federal jurisdiction extends to non-navigable tributaries of navigable streams. The history of the expanding federal jurisdiction over 'navigable waters' is traced

through an analysis of judicial decisions. Three conclusions follow from the case analysis: (1) the expansive nature of federal jurisdiction in the area is a function of the successive definitions of the term 'navigable waters'; (2) the Grand River case extended jurisdiction from non-navigable portions of a navigable stream to non-navigable tributaries of a navigable stream; and (3) the Grand River case indicates a trend toward a rule that would afford the federal government a prerogative over all streams that could be classified as the watershed of a navigable waterway. WATERS AND WATERCOURSES - EASEMENTS - IMPLIED DEDICATION OF FLOWAGE EASEMENT APPURTENANT TO A DAM,
James S. Moore, Jr.
Tex L Rev, Vol 34, No 3, p 493-494, Feb 1956. 2 p.

Descriptors: *Minnesota, *Easements, *Water level fluctuations, *Impounded waters, Judicial decisions, Watercourses (Legal), Legal aspects, Dams, Lakes, Legislation, Water law, Overflow, Condemnation, Flood control, Conservation, Recreation, Flooding, Texas, Variability, Flow characteristics.
Identifiers: *Flowage easements, *Implied dedication, Easement by prescription, Common-law dedication.

In State v Fischer, 71 NW 2d 161 (Minn 1955), the defendants' lands had been continually flooded for over fifteen years by public lake waters impounded by a dam. The State of Minnesota sued to establish a flowage easement by implied dedication, relying in part on a state statute. The defendants offered evidence that water levels had fluctuated during the fifteen-year period. The trial court found a flowage easement in the state and the state supreme court reversed. The standard requisites for common-law dedication of an individual's land to the state are the landowner's expressor implied consent to dedicate to the public use and the public's acceptance through its use. One court and the Minnesota Legislature have attempted to supplement the common-law principles of dedication by stating that a set number of years continuous flowage by public waters is conclusive evidence of dedication. The problem incurred with such supplementation is that it does not achieve the desired result of easing the state's burden of proof in cases where the water level fluctuates; this is because dedication, as construed by the courts, applies only to that land continuously flooded. RIPARIAN RIGHTS - RIGHT TO FOLLOW ACCRETIONS ACROSS FIXED BOUNDARY LINE.

Tenn L Rev, Vol 19, No 6, p 862-864, Feb 1947. 3 p, 10 ref.

Descriptors: *Tennessee, *Accretion (Legal aspects), *Erosion, *Riparian rights, Legal aspects, Judicial decisions, Mississippi River, Channels, Bank erosion, Riparian land, Boundaries (Property), Banks, Relative rights, Severance, Boundary disputes, Navigable rivers.
Identifiers: *Riparian owners, *Non-riparian owners.

Plaintiff was the riparian owner of a tract on the Mississippi River; defendant was the non-riparian owner of a tract adjacent and upland to that of the plaintiff. The plaintiff's land completely eroded away and by 1917 the defendant had become a riparian owner. When the process of accretion returned the two tracts of land to their pre-erosion status, the plaintiff brought an action of ejectment. The court held that when land originally non-riparian becomes riparian because of erosion, the now riparian landowner becomes vested with the rights of a riparian owner and entitled to all accretions to his ripa even though such accretions extend across a fixed boundary line and occupy a space which was once that of another. The courts of this country follow the general rule that riparian owners are entitled to additions to their land caused by the process of accretion, but there is conflict among states when the accretions cross a boundary line and cover an area formerly held by another and lost by him due to erosion. The Connecticut rule, which represents the weight of authority, is that accretions belong to the ripa to which they attach. (Keith-Florida)

EQUAL FOOTING AND THE MARGINAL SEA,
Jack C. Terry.
U Kansas City L Rev, Vol 19, p 66-71, 1967. 6 p, 50 ref.

Descriptors: *Federal government, *California, *Louisiana, *Texas, Judicial decisions, Subsoil, Low water mark, Ownership of beds, Tidal waters, High water mark, Oil, International waters.
Identifiers: *Marginal sea, Tidelands, Constitutional law.

The United States Supreme Court has decided three cases involving the question of ownership of subsoil under the marginal sea off the coasts of California, Louisiana, and Texas. All three cases were decided in favor of the United States rather than the adjacent states involved. The land in question lies between the low tide mark on the beaches and the three mile United States territorial limit. This land is now of considerable value due to oil discoveries. This comment deals with the Texas appeal for a rehearing. Texas contended that it should be treated differently from the other states because it was an independent nation prior to admission to the Union. This theory was not accepted because Texas was admitted to the Union on an equal footing with the original states in all respects. (Watson-Florida)

CANALS AND WATERWAYS.

Ill Ann Stat ch 19, secs 8-37.24 (Smith-Hurd 1963), as amended, (Supp 1969).

Descriptors: *Illinois, *Regulation, *Canals, *Transportation, Michigan, Legislation, Administration, Open channels, Ditches, Drains, Inland waterways, Locks, Navigation, Dams, Riparian rights, Docks, Drains, Banks, Navigable waters, Obstruction to flow, Administrative agencies, Legal aspects.
Identifiers: Penalties.

The powers and duties of the Illinois Department of Public Works and Buildings with relation to the Illinois and Michigan canal, including its feeders, basins, and property including locks, dams, and navigation improvements of the Illinois and Little Wabash rivers are set forth. Rules and regulations regarding tolls and navigation as well as leasing and selling provisions concerning land, ice harvesting, and riparian rights are included. The Department shall establish title to the canal lands in the state and keep the canal, locks, and dams in good condition. No drains or ditches may be dug or sand or gravel taken without the Department's consent when such action causes injury to the canal. No wharves may be constructed or the banks of the canal used without the Department's consent. The lock gates shall not be interfered with and the canal's use may not be interfered with. No bridge may be constructed over the canal without the approval of the Department. The canal is abandoned as a carriage for commerce. Canal lands not needed for public purposes shall be sold. (Moulder-Florida)

ILLINOIS DRAINAGE LAW (A COMMENTARY),
Illinois State Bar Association.
Donald V. Dobbins.
39-42 Ill Ann Stat XIX-XXXV (Smith-Hurd 1956).

Descriptors: *Illinois, *Drainage districts, *Drainage systems, *Administrative agencies, Legislation, Drainage, Drainage programs, Drains, Ditches, Levees, Natural flow doctrine, Repulsion (Legal aspects), Assessments, Construction, Costs, Right-of-way, Condemnation, Local governments, Water law.
Identifiers: Subdistricts.

While repealing previous acts, the Illinois Drainage Code of 1955 retains the classifications and organization of drainage districts established under the 1879 Levee Act and the 1885 Farm Drainage Act. Those acts authorized the establishment of drainage and levee districts, mutual districts, outlet districts, one township districts, union districts, special districts, and river districts to be governed by commissioners. The Code grants exclusive jurisdiction over the organization and operation of all districts to the county court for the county wherein the district lies, but retains the same commissioner structure. The Code specifies methods for organizing new districts. Assessments for drainage district costs are characterized as original, annual maintenance, and additional and are assessed by the individual districts upon county court approval. Commissioners' general powers under the code include specific powers to: (1) obtain rights-of-way by agreement or condemnation; (2) enter into contracts for district purposes; (3) establish an emergency operating fund; (4) issue notes and bonds of the district; and (5) incur other debts. The Code allows detachment of lands from a district for storm drainage purposes, and permits annexation of lands to existing districts. (McDonough-Florida)

ISLANDS AND ABANDONED RIVER CHANNELS.

Iowa Code Ann secs 568.1-568.25 (1950), as amended, (Supp 1969).

Descriptors: *Iowa, *Beds, *Ownership of beds, *Islands, Legislation, River beds, Stream beds, Banks, Navigable rivers, Rivers, Dry beds, Channels, Boundaries (Property), Surveys, Appraisals, Leases, State governments, Boundary disputes, Land tenure, Legal aspects.

Upon application to the Secretary of State by the county auditor or a prospective purchaser land, bars, or islands in channels of abandoned and unusable navigable streams may be sold. The Secretary may order a survey of the land by the county surveyor, or he may use a prior recorded survey. Three disinterested freeholders are appointed to appraise the land. First purchase rights are reserved for a person who has occupied the land as a home for at least three years, upon prompt filing of an application. Otherwise the land is sold by advertised bids for not less than the appraised value. If no applications or bids are received, the land may be leased, at the end of which period it is re-advertised for sale. If such lands are in the possession of any person, company, or corporation that has claimed ownership for over ten years and has paid taxes and made valuable improvements, they may be sold to said claimant. The Attorney General must first quit title and determine the value of the land by filing suit in the district court. River islands may be sold or leased after survey and appraisal. (Douberley-Florida)

LEVEES.
Ky Rev Stat Ann secs 266.010-266.990 (1963).

Descriptors: *Levees, *Kentucky, *Regulation, *Administrative agencies, Legislation, Eminent domain, Engineering structures, Local governments, Adjudication procedure, Administrative decisions, Easements, Equitable apportionment, Judicial decisions, Compensation, Construction costs, Assessments, Loans, Maintenance costs, Taxes, Decision making, Legal aspects, Planning, Financing.

The establishment of levees by the county court in any county in Kentucky when it is conducive to the public welfare or public utility is provided for. Upon petition setting forth the necessity for a levee, the court shall appoint impartial commissioners to study the proposed plans and make specific recommendations in a report. Details of this report and the procedure for exceptions to the proposed levee are outlined. If the plans are approved, a board of five levee commissioners is appointed by the court. The term, method of election, bond, and compensation of the board are provided. The board's duty to superintend the construction, care, and protection of the levee is detailed, and powers are given to perform these duties. These include power to enter agreements with the federal government, acquire land, levy an annual tax, borrow funds, issue bonds, and make any other additional assessments. All lands in the levee district are subject to a lien for the costs of the levee. Fines for violations of provisions in the chapter are provided. (Schram-Florida)

LEVEES.
Ky Rev Stat Ann secs 266.010-266.110 (1963).

Descriptors: *Levees, *Kentucky, *Administrative agencies, Legislation, Eminent domain, Engineering structures, Local governments, Adjudication procedure, Administrative decisions, Easements, Equitable apportionment, Judicial decisions, Compensation, Construction costs, Assessments, Loans, Taxes, Maintenance costs, Decision making.

This chapter enables the county court in counties of less than 200,000 population to establish and aid in the construction of any levee along a river or watercourse within or bounding the county. A petition, signed by five landowners, setting forth the necessity for the levee and sufficient surety bond are required. Upon filing the petition, the county court shall appoint three impartial commissioners who shall: (1) survey the proposed site of the levee; (2) ascertain the names of the owners and tenants of the land; (3) assess a just compensation for the land required for the levee; and (4) make a signed written report to the court setting forth this information with a map of the proposed route of the levee. If the report is favorable, the court shall issue process against the required land. If exceptions are filed, there shall be a trial and, if needed, an appeal on the issues. If the court decides that the levee should be established, it shall so order, and every four years thereafter appoint a board of five levee commissioners who are resident landowners of the vicinity of the levee. DRAINAGE AND RECLAMATION ACT OF 1912.
Ky Rev Stat Ann secs 267.010-267.990 (1963).

Descriptors: *Kentucky, *Drainage programs, *Reclamation, *Drainage districts, Legislation, Multiple-purpose projects, Drainage, Surface drainage, Ditches, Drainage engineering, Land reclamation, Canals, Drains, Administrative agencies, Coordination, Decision making, State governments, Water policy, Water law, Eminent domain, Assessments, Tax rate, Maintenance, Construction.

This act empowers any county court to establish and have constructed any ditch, drain, or canal for the purpose of draining low, swampy, or overflowed land. Broad powers are distributed among the court, a board of viewers, drainage district directors, and county drainage commissioners. These powers include taxation and the right of eminent domain. The act contains numerous procedural details covering bonding, organization of districts, assessments, and collections. Specific powers are granted to each of the supervisory boards in relation to methods of hiring, construction, and maintenance. In addition, such board's duties are outlined in detail. Financing methods are discussed in detail and include the right to place liens against the land within each drainage district to insure payment of assessments. Finally, provisions for establishing and organizing districts are stipulated. (Schram-Florida)
W70-00821

DRAINAGE AND RECLAMATION ACT OF 1912.
Ky Rev Stat Ann secs 267.010-267.240 (1963).

Descriptors: *Kentucky, *Drainage programs, *Reclamation, *Drainage districts, Legislation, Multiple-purpose projects, Drainage, Surface drainage, Ditches, Drainage engineering, Land reclamation, Canals, Drains, Administrative agencies, Coordination, Decision making, State governments, Water policy, Water law, Eminent domain, Assessments, Tax rate, Maintenance, Cost-benefit analysis, Construction.

Power is given to any county court to have constructed a ditch, drain, or canal to reclaim swampy or overflowed land upon petition by landowners in the affected area. Procedural provisions, such as bonding, a board of viewers to examine and report on feasibility, and confirmation, are outlined. Upon a favorable report from the board of viewers, a board of directors and a drainage district are to be established. The commissioners, consisting of directors from each district have the power to acquire land and any other powers necessary to carry out the provisions of this chapter, including eminent domain. A drainage engineer is to be hired to map, profile, and plan the needed construction. The board of viewers is given the power to classify and assess land within the district and to determine the rate of assessment. Additional provisions including estimates of cost, assessments of benefits, and assessment of compensable damages are outlined. The court is to keep a record of all drainage within the district, certified by the county clerk. (Schram-Florida)
W70-00822

DRAINAGE AND RECLAMATION ACT OF 1912.
Ky Rev Stat Ann secs 267.250-267.330 (1963).

Descriptors: *Kentucky, *Drainage programs, *Reclamation, *Drainage districts, Legislation, Multiple-purpose projects, Drainage, Surface drainage, Ditches, Drainage engineering, Land reclamation, Canals, Drains, Administrative agencies, Coordination, Decision making, State governments, Water policy, Water law, Eminent domain, Assessments, Tax rate, Maintenance, Condemnation, Construction, Financing.
Identifiers: *Bonds.

Payment for work done under this chapter is to be made in monthly installments. When it is necessary for the purposes of this act, contractors shall have the right of access and power to remove certain obstructions. Methods of construction when an improvement crosses railroad property are set forth. When the purchase of land needed for a right of way is not possible, procedures for condemnation are proposed. Details for an assessment role, including the statement of costs, what the role shall include, and provisions for hearings on the role and statement are outlined. Additional provisions are made for payment and collection of assessments when it averages less than twenty-five cents per acre. When the average assessment is more than this amount, bonds are authorized, and failure to pay the assessment is consent to the bonds. In addition, procedures are outlined for issuance and sale of these bonds and collection of assessment installments. (Schram-Florida)

DRAINAGE AND RECLAMATION ACT OF 1912.

Ky Rev Stat Ann secs 267.340-267.500 (1963).

Descriptors: *Kentucky, *Drainage programs, *Reclamation, *Drainage districts, Legislation, Multiple-purpose projects, Surface drainage, Drainage, Ditches, Drainage engineering, Land reclamation, Canals, Drains, Administrative agencies, Coordination, Decision making, Water policy, Water law, Maintenance, Assessments, Financing, Obstruction to flow.

Either the board or the county court is empowered to change assessments and relevy to cover any deficit caused by unforeseen circumstances. Liability of successors in title and contribution for joint owners are provided. Provisions for liens of assessments and enforcement of same are provided. Maintenance procedures are outlined and provisions for hiring of a drainage superintendent and an attorney for the board are made. Financial details are dealt with and it is provided that expenses should be apportioned among the districts. Landowners may use these improvements as an outlet for lateral drains. Natural drains which receive water from the public drains and ditches in this section are to be under the control of the act as extensions of the public ditch. Any obstructions or damage caused by adjoining landowners will be charged to them. Provisions for a drainage commissioner and board of supervisors in counties having seventy-five or more districts are outlined. Procedures for establishing separate districts are also included. (Schram-Florida)

DRAINAGE AND RECLAMATION ACT OF 1912.
Ky Rev Stat Ann secs 267.520-267.990 (1963).

Descriptors: *Kentucky, *Drainage programs, *Reclamation, *Drainage districts, Legislation, Multiple-purpose projects, Surface drainage, Drainage, Ditches, Land reclamation, Canals, Drains, Administrative agencies, Coordination, Decision making, Water policy, Water law, Assessments, Tax rate.

The members of the district drainage board shall qualify and organize in the same manner as the county board. The powers and duties of the district board shall also be the same as the county board within its own district. They shall have full jurisdiction and control over the work provided for under the proceeding for which they were established. An amendment of the order establishing the district to change the name of any landowner or description of land can be made at any time. Drainage districts may be enlarged so as to include other contiguous land upon petition of the board to the county court. The fiscal court of any county shall retain control of improvements made by general taxation and may make appropriation to aid any drainage district within the county. A majority, either in amount or number, of those assessed for the maintenance of any improvement may petition for discontinuance of the improvement. (Schram-Florida)
W70-00825

FLOOD CONTROL ACT.
Ind Ann Stat 27-1101 thru 27-1109 thru 27-1134 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Administrative agencies, *Flood control, *Water resources development, Legislation, Floodways, Channel improvement, Flood plains, Multiple-purpose projects, Project planning, Planning, Administration, Cities, Floodwaters, Water resources, Taxes, Tax rate, Adjudication procedure, Obstruction to flow, Eminent domain, Loans, State governments, Appropriation, Drains, Levees.

To control floods and preserve Indiana's water resources, and to establish a comprehensive plan toward those goals, the Natural Resources Commission is granted enumerated powers and duties. There are provisions for cooperation by the Commission with federal and state agencies and for the establishment of floodways. Procedures are set forth for the removal and regulation of obstructions placed in floodways and for the approval of flood control works by the Commission. Orders of the Commission may be appealed. The act makes provision for appropriations to fulfill the purposes of the act, and the Flood Control Revolving Fund, from which loans are made to municipalities for the institution and accomplishment of flood control programs, is created. Flood control programs may be instituted by municipalities with the approval of the Commission and the State Board of Finance. Municipalities may levy annual taxes for flood control purposes. The act defines flood, flood water, flood flow, channel, flood plains, floodway, flood control, flood easement, and water resources. (Marsee-Florida)
W70-00827

FLOOD CONTROL ACT.
Ind Ann Stat 27-1101 thru 27-1103, 27-1109 thru 27 1117 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Administrative agencies, *Flood control, *Water resources development, Legislation, Floodways, Channel improvement, Flood plains, Multiple-purpose projects, Project planning, Planning, Administration, Cities, Floodwater, Water resources, Obstruction to flow, Eminent domain, Governments, State governments, Federal government, Regulation, Control, Surveys, Reservoirs.

To control floods and preserve Indiana's water resources, the Natural Resources Commission has the powers and duties to: (1) establish comprehensive plans for flood control and preservation of water resources; (2) require information from local officials; (3) utilize other state agencies and employ technical experts; (4) enter upon lands or waters for purposes of investigation; (5) conduct hearings; (6) exercise the power of eminent domain; (7) cooperate with state and federal agencies; (8) maintain actions to abate nuisances; (9) encourage local initiative in flood control; (10) grant easements and the rights to construct and operate flood control structures; (11) exercise jurisdiction over public and private waters for purposes of flood control; (12) grant or deny applications for obstructions to be placed in floodways and remove obstructions; (13) make surveys of water resources; and (14) obtain recommendations from the Department of Conservation water, flood flow, channel, flood plains, floodway, flood control, flood easement, and water resources. (Marsee-Florida)

FLOOD CONTROL ACT.
Ind Ann Stat secs 27-1118 thru 27-1134 (1960), as amended, (Supp 1968).

Descriptors: *Indiana, *Administrative agencies, *Flood control, *Water resources development, Legislation, Multiple-purpose projects, Administration, Taxes, Tax rate, Adjudication procedure, Loans, Governments, State governments, Financing, Appropriation, Floodways.

The Natural Resources Commission may establish any floodway as a commission floodway and may alter or terminate the same. All flood control works must be coordinated in design, construction, and operation and must be approved by the Commission. Persons affected by a Commission order relative to commission floodways or to the approval of flood control works may appeal to the courts as provided herein. Loans may be made to municipalities, for the purpose of accomplishing flood control programs, from the Flood Control Revolving Fund. Municipalities may institute and administer flood control programs, when approved by the State Board of Finance and the Commission, and may levy an annual tax on real and personal property for such purpose. No loan may be made to a municipality unless: (1) proper application has been made; (2) approval has been granted by the state Board of Finance and the Commission; and (3) assurance is given by the municipality that the flood control program will be satisfactorily maintained. The State Board of Finance and the Commission must ascribe to loan applicants a priority rating based on the need for a flood control program. (Marsee-Florida)

INTERSTATE DRAINS.
Ind Ann Stat secs 27-2601 thru 27-2606 (Supp 1968).

Descriptors: *Indiana, *Drainage programs, *Interstate commissions, *Local governments, Drainage, Cost sharing, Construction costs, Legislation, Construction, Drainage engineering, Benefits, Damages, Planning, Repairing, Administrative agencies, Assessments, Interstate compacts, Legal aspects.

Whenever proceedings are initiated in this or any adjoining state to construct or reconstruct a drain which will affect lands in both states, the county board of the county affected shall have authority to join the other state in the effort to construct such drain. Upon receipt of an offer from the other state or an acceptance of this state's offer, such board shall proceed to form an interstate board, electing a chairman and clerk from different states. The interstate board members from this state shall have half the votes of that board. The board may hire an engineer to work with the county surveyors. Upon receipt of a report, the Drainage Board of Indiana shall assess the benefits and damages to each tract of land in this state. Whenever improvement is established in both states and funds are available, the interstate board shall meet and let work contracts. (Smith-Florida)

BRIDGES - GENERAL PROVISIONS.
Miss Code Ann secs 8420-8434 (1956).

Descriptors: *Mississippi, *Bridges, *Culverts, *Bridge construction, Local governments, State governments, Gulf of Mexico, Construction, Construction costs, Financing, Planning, Project planning, Cost allocation, Legal aspects, Legislation, Highways, Condemnation.

All bridges and culverts hereinafter built or placed in state roads must be the full width of the crown of the roadway. The boards of supervisors of counties bordering on tidewaters of the Gulf of Mexico are empowered to provide illumination for bridges and other parts of public highways within their counties. The boards may further establish, operate, and maintain toll bridges or ferries on any part of a public road. The boards are empowered to purchase or to acquire by condemnation, privately-owned bridges where these link segments of public roads. The boards may purchase toll bridges, except for interstate or state operated bridges, and may maintain them in a toll-free status. Where a bridge is necessary between two or more counties, the boards of supervisors of the respective counties may join in such bridge's construction and financing. If no agreement can be reached, a single county board may construct and maintain the bridge, provided it secures the consent of the other counties involved. (Kelly-Florida)

THE QANATS OF IRAN,
H. E. Wulff.
Scientific American, Vol 218, No 4, p 94-100; 105, 1968. 10 fig.

Descriptors: *Aqueducts, *Arid lands, *Water conveyance, *Water supply, *Aquifers, Irrigated land, Construction costs, Irrigation systems, Channels, Foreign construction, Irrigation operation and maintenance.
Identifiers: *Qanats, *Iran.

Most of Iran is arid, receiving only 6 to 10 inches of rainfall a year. Yet Iran is a farming country that grows its own food and also exports food and fiber. 75% of all water is provided by some 22,000 qanats - hand-dug underground channels that conduct water by gravity from highland aquifers to arable plains. This system was started some 3,000 years ago. This paper reviews the history of qanats, methods of construction, current problems of rising costs, and land reforms - all of which may bring about a switch to individual wells and pumps to meet new demands for irrigation water. (Crouse-Arizona)

NOTES ON PROBLEMS OF IRRIGATION IN THREE LIBYAN OASES,
Lars Eldblom.
Ekistics, Vol 23, No 137, p 199-202, 1967. 8 fig, 3 ref.

Descriptors: *Irrigation practices, *Arid lands, *Irrigated land, *Shallow wells, *Artesian wells, Water rights, Rotations, Land use, Water supply, Pumps.
Identifiers: *Oases, *Lybia, Land use pattern.

This paper presents findings at three irrigated oases in Lybia. Use of shallow, dug wells results in an irregular boundary and scattered gardens with long crop rotation periods. Artesian wells create a more compact structure with shorter rotations and thus, soil fertility problems. Water is drawn from most shallow wells by ancient lever (Khettera) or pulley (Dalou) devices. Engine driven pumps are used on some of the better wells, but are of limited economic value owing to restricted water supply,

high costs and maintenance problems. Use of pumps or enlargement of wells tends to raise problems regarding partition of land between already cultivated gardens. (Crouse-Arizona)

WATER SUPPLY, USE AND MANAGEMENT,
F. Dixey.
In E S Hills, Ed, Arid Lands: A Geographical Appraisal, London, Methuen, p 77-102, 1966. 13 fig, 49 ref.

Descriptors: *Water supply, *Water utilization, *Arid lands, *Surface waters, *Groundwater, Hydrologic cycle, Water harvesting, Ephemeral streams, Water quality, Water table, Aquifers, Southwest U.S., Artificial recharge, Groundwater mining, Saline water intrusion, Confined water.
Identifiers: *Qanats, Australia, North Africa, USSR, Fossil water.

This chapter is a broad review of the state of knowledge of management and use of arid lands water supplies through 1965. The way arid land waters are managed has profound effect on quantity, quality and timing of water available for beneficial use by man. Social and economic as well as purely physical aspects must be considered for optimum development in arid lands. Particular emphasis is placed on groundwater since it is normally a more reliable source than fluctuating or ephemeral surface waters in arid zones. The qanats of the Middle East and Asia, artesian wells and natural and artificial recharge of aquifers underlying dry but arable lands are discussed. The hazards of mismanagement of groundwater are emphasized. All of these forms of mismanagement can cause a decline in both quantity and quality of water available, increasing costs and subsequent decline in economic value of the groundwater body. CURRENT DEVELOPMENTS IN GROUND WATER LAW.

Am Water Works Assn J, Vol 41, No 11, p 1002-1012, Nov 1949. 11 p.

Descriptors: *Groundwater, *Legislation, *Water allocation (Policy), Well permits, Well regulations, Subsurface waters, Water permits, Non-consumptive use, Water utilization, Preferences (Water rights), Appropriation, Prior appropriation, Priorities, Air conditioning, Water resources, Administrative agencies, Water supply.

The legislative developments in limiting the use of ground water are discussed. In Indiana, legislation limiting the use of ground water for cooling air will soon be supplemented by proposed legislation which will allow limiting the use of ground water where its withdrawal exceeds or threatens to exceed the natural replenishment of such waters. In Kansas, legislation requires persons intending to acquire an appropriation right to waters to apply to the state for a permit in order to establish priority. New Jersey generally allocates waters on application after proof of public necessity, non-interference with existing water supplies, protection of the supply from contamination, and protection of the dry weather flow of the stream. Recent legislation also allows the regulation of private wells. In New York, the Water Power and Control Commission must approve all applications involving the development of new water supplies. A serious deterioration of ground water conditions in four Long Island counties brought forth recent legislation which requires licensing of all well drillers within those counties. Ohio has legislation regulating defective wells. Legislation also requires well drillers to submit logs of all water wells drilled. (Gabrielson-Florida)

4C. Effects on Water of Man's Non-Water Activities

DEPARTMENT OF CONSERVATION.
Minn Stat secs 84.156 thru 84.162, 84.415, 84.43 thru 84.45 (1964), as amended (Supp 1968).

Descriptors: *Minnesota, *Easements, *Right-of-way, *Conservation, Water conservation, Dams, Condemnation, Overflow, Utilities, Permits, Federal government, Overland flow, Water control, Highways, Legislation, Damsites, Public health, Natural resources, Boating regulations, Boats, Public lands, Resource development, Administrative agencies, United States.
Identifiers: *Flowage easements, Public waters.

The United States is granted an easement and right to flow and overflow the right-of-way of any highway lying within the Lac qui Parle Water Control Project below the 945.0 foot elevation. The state Commissioner of Conservation is authorized to acquire the underlying fee title or right to flow to the right-of-way of any highway lying within such water control project and to transfer same to the United States. The Commissioner is also authorized to acquire all dam site and flowage easements necessary to accomplish the purposes of this section and to construct all control works needed to restore and control the water level. The right to condemn land and to enter into contracts with the United States is also given. The Commissioner may grant licenses to utility companies permitting passage over, under, or across state-owned lands or water. Such permits are subject to revocation if in conflict with a public use of the land or water. The regulation of watercraft is declared necessary for the protection of public health and for the conservation of natural wilderness conditions and other natural resources. The Commissioner is empowered to designate wilderness areas. (Schram-Florida)

A CLIMATOLOGICAL EVALUATION OF PRECIPITATION PATTERNS,
Public Health Service, Washington, D.C
J. P. Changnon, Jr.
SEC Technical Report A62-5, Symposium, Air Over Cities, Nov 1969, Cincinnati, Ohio, p 37-67. 6 fig, 11 tab, 17 ref.

Descriptors: *Urbanization, *Urban effects, *Rainfall distribution, *Raingages, *Distribution patterns, Temperature, Air pollution.
Identifiers: Champaign-Urbana urban area, Seasonal precipitation pattern, Synoptic conditions.

A 13-year measurement program of urban rainfall distribution in Champaign-Urbana, a moderate sized municipality of Illinois is described in this article. The monthly, seasonal, and annual precipitation patterns derived from the network data are discussed. The annual precipitation pattern is compared with that of a nearby rural network to help evaluate the apparent urban-affected precipitation pattern obtained over the urban area. The urban effects have been claimed to produce increases in precipitation on the order of 5 to 15%. The results of Champaign-Urbana study have shown that the precipitation maximization in Urbana could easily be claimed to result either from urban effects or from natural variations of precipitation. Raingage exposures presented a problem in the evaluation of effects. To instrument an urban area for this purpose is difficult and tremendously expensive. Natural variations of precipitation pose another problem. (Upadhyaya-Vanderbilt)

CIVIL LAW PROPERTY--ALLUVION DISTINGUISHING LAKES FROM RIVERS AND STREAMS,
Kenneth E. Gordon, Jr.
La L Rev, Vol 25, No 2, p 554-558, Feb 1965. 5 p, 19 ref.

Descriptors: *Louisiana, *Alluvion, *Riparian rights, *Classification, Water law, Remedies, Rivers, Streams, Lakes, Evaluation, Navigable rivers, Navigation, Accretion (Legal aspects), Bank erosion, Silts, Erosion, Channel morphology, Sediments, Boundaries (Property), Judicial decisions, Geologic investigations, Legal aspects.

The classification of a body of water as a stream, river, or lake has important consequences in Louisiana property law. The governing article of the Louisiana Civil Code does not refer to lakes in its application of the rules of accretion formed to any soil on the shore of a river or other stream. The crucial question becomes whether a particular body of water is to be classified as a lake, a river, or a stream and what test should be employed to make the classification. Jurisprudence prior to State v Cockrell, 162 So 2d 361 (La. App 1st Cir. 1964), indicates that a body of water is a river or stream if the water moves, albeit not constantly and has the power to carry silt and form alluvion. In Cockrell, the court went beyond the evidence of current sufficient to carry alluvion and considered other geological characteristics presented by experts as being typical of streams as opposed to lakes. This decision makes possible the use of expert testimony and physical evidence all of which could greatly simplify the difficulties of classifying bodies of water. (Moulder-Florida)

THE CHICAGO WATER DIVERSION CONTROVERSY,
Herbert H. Naujoks.
Marq L Rev, Vol 30, No 3, p 149-176, Dec 1946. 28 p, 45 ref.

Descriptors: *Illinois, *Diversion, *Water resources development, *Legal aspects, State governments, Damages, Remedies, Water pollution, Great Lakes, Water level fluctuations, Diversion losses, Diversion structures, Legislation, Mississippi River, Pollution abatement, Discharge (Water), Drainage effects, Drainage systems, Judicial decisions, Canals, Flow augmentation, Flow control.
Identifiers: *Chicago, Constitutions.

This is the first of two articles dealing with the Chicago Water Diversion Controversy. Part One deals with the history and present status of the controversy. It offers an account of the history and background of this litigation and describes the status of the problem up until 1946. It touches on the legal issues involved, as well as the physical features of the Great Lakes-St. Lawrence system, the Illinois Waterway, the Chicago Drainage Canal, the details concerning sewage disposal in the Chicago area, and related matters. ESTABLISHMENT AND SURVIVAL OF SEVERAL GRASSES IN THE SAGEBRUSH TYPE, WEST-CENTRAL NEW MEXICO,
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
O. D. Knipe.
US Forest Serv Res Note RM-149, 1969. 2 p.

Descriptors: *Vegetation establishment, *Erosion control, Range management, Revegetation, Vegetation regrowth, Watershed management, Rehabilitation, New Mexico.

Several grasses were drill-seeded in the sagebrush (Artemesia tridentata) type of west-central New Mexico to test their establishment, survival, and erosion control potential. Competition from the existing heavy stand of sagebrush was eliminated by plowing. The species seeded were blue grama (Bouteloua gracilis), pubescent wheatgrass (Agropyron trichophorum), crested wheatgrass (A. desertorum), western wheatgrass (A. smithii), alkali sacaton (Sporobolus airoides), Indian ricegrass (Oryzopsis hymenoides), Russian wildrye (Elymus junceus), and buffalograss (Buchloe dactyloides). A good stand of all wheatgrasses, Russian wildrye, buffalograss, and Indian ricegrass, was obtained, however, at the end of the fourth growing season, the only species present in sufficient numbers were Russian wildrye and buffalograss. Losses of wheatgrass and Indian ricegrass plants was due to below average rainfall during the second growing season after seeding. It was concluded that Russian wildrye and buffalograss are well suited for use in revegetating deteriorated sagebrush sites in west-central New Mexico.

05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

DETERMINING ORGANIC CONTAMINANTS IN AIR AND WATER,
Bureau of Mines, Pittsburgh, Pa. Pittsburgh Mining Research Center.
A. G. Sharkey, Jr., J. L. Shultz, T. Kessler, and R. A. Friedel.
Research/Development, Vol 20, No 9, p 30-32, Sept 1969. 3 p, 1 fig, 1 photo, 3 tab, 14 ref.

Descriptors: *Chemical analysis, *Pollutant identification, *Analytical techniques, *Spectrometers, *Mass, Gas Chromatography, Instrumentation, Calibrations, Organic compounds.
Identifiers: *High resolution mass spectrometry.

High resolution mass spectrometry may be used to identify organic pollutants in air and water. A major advantage of the technique is that the elemental compositions of many organic compounds may be determined on essentially total samples. A limitation is that isomers cannot be determined, but this may be overcome by combining mass spectrometry with gas chromatography and other techniques. The high resolution mass spectrographic data of several organic components of combustion and sewage wastes are tabulated and compared with results of analyses of samples of air and water from Pittsburgh. (Knapp-USGS)

RADIOMETRIC AND SPECTROPHOTOMETRIC DETERMINATION OF TRACE AMOUNTS OF SELENIUM USING 3, 3' - DIAMINOBENZIDINE AS THE INITIAL REAGENT,
Missouri Univ., Kansas City. Dept. of Chemistry.
James H. Wiersma, and Peter F. Lott.
Anal Letters, No 1 (10), p 655-667, 1968. 13 p, 1 fig, 2 tab, 15 ref. NIH Grant USPH GM 12830-02. OWRR Proj No A-009-MO.

Descriptors: *Chemical analysis, *Analytical techniques, *Trace elements, Spectrophotometry, Radioactivity techniques, Solubility, Laboratory tests, Chemistry, Color reactions, Indicators, Test procedures.
Identifiers: *Selenium analysis, Diaminobenzidine.

Radiometric and spectrophotometric procedures for selenium analysis were developed based on the formation and separation of the mono- and di-piazselenols of 3,3' -diaminobenzidine. Analysis of samples, reaction conditions, and sensitivity of the procedures are discussed. (Knapp-USGS)
W70-00460

DETERMINATION OF PHENOXY ACID HERBICIDES IN WATER BY ELECTRON-CAPTURE AND MICROCOULOMETRIC GAS CHROMATOGRAPHY,
Geological Survey, Washington, D.C.
Donald F. Goerlitz, and William L. Lamar.
Geol Surv Water-Supply Pap 1817-C, 1967. 21 p, 2 fig, 3 tab, 18 ref.

Descriptors: *Analytical techniques, *Herbicides, *Gas chromatography, Chemical analysis, Water analysis, Water chemistry.
Identifiers: Phenoxy acid herbicides, (2,4,5-T), (2,4-D), Silvex.

A sensitive gas chromatographic method using microcoulometric titration and electron-capture detection for the analysis of 2,4-D, silvex, 2,4,5-T, and other phenoxy acid herbicides in water is described. The herbicides are extracted from unfiltered water samples (800-1,000 ml) by use of ethyl ether, then the herbicides are concentrated and esterified. To allow the analyst a choice, two esterification procedures - using either boron trifluoride-methanol or diazomethane - are evaluated. Microcoulometric gas chromatography is specific for the detection of halogenated compounds such as the phenoxy acid herbicides whereas it does not respond to nonhalogenated components. The practical lower limits for measurement of the phenoxy acid herbicides in water primarily depend upon the sample size, interferences present, and instrumentation used. With 1-liter samples of water, the practical lower limits of measurement are 10 ppt for 2,4-D and 2 ppt for silvex and 2,4,5-T when electron-capture detection is used, and approximately 20 ppt for each herbicide when analyzed by microcoulometric-titration gas chromatography. Recoveries of the herbicides immediately after addition to unfiltered water samples averaged 92%-98%. 2,4-D may be rapidly degraded, especially if the samples are obtained from areas which have been repeatedly sprayed. OIL POLLUTION OF THE SEA: DETECTION.

Harv Int L J, Vol 10, No 2, p 353-355, Spring 1969. 3 p, 4 ref.

Descriptors: *Water pollution sources, *Chemical analysis, *Oil, *Oceans, Organic compounds, Ships, Sampling, Water analysis, Measurement, Reliability, Testing.
Identifiers: *Detection, Identification, Enforcement.

Of extreme importance to the effective control of oil pollution of the sea is the problem of enforcement. The crucial issue is the matter of detecting the source of pollution. Visual surveillance is inadequate in view of the area to be policed and the rapidity with which an oil slick breaks up. To facilitate identification, some kind of system for the labeling of tanker cargo seems necessary. A tagging system has been proposed which would be reliable, nearly tamper proof, and feasible with today's technology. The system would require certain combinations of hydrocarbon compounds to be mixed with each oil cargo. Only a small, inexpensive amount would be required. Samples from discovered oil slicks would be sent to a central laboratory for analysis of the tagging compounds. With this system, the source of any oil discharge can be precisely identified. (See W70-00786). (Heckerling-Florida)

NITROGEN CONTAMINATION OF GROUNDWATER BY BARNYARD LEACHATES,
Guelph Univ. (Ontario). Dept. of Soil Science.
R. W. Gillham, and L. R. Webber.
J Water Pollut Contr Federation, Vol 41, No 10, p 1752-1762, Oct 1969. 11 p, 10 fig, 2 tab, 13 ref.

Descriptors: *Farm wastes, *Cattle, *Leaching, *Water pollution sources, Path of pollutants, Water pollution effects, Nutrients, Groundwater movement, Nitrogen, Waste water (Pollution).
Identifiers: Cattle wastes, Feedlot wastes.

A zone of nitrogen-contaminated groundwater associated with a barnyard was studied to determine the quantity of inorganic nitrogen reaching the groundwater from the barnyard. From piezometric potential and hydraulic conductivity measurements, quantitative flow nets were drawn permitting groundwater discharge calculations. An in-

crease from 2 to 15 mg/l inorganic nitrogen occurred in the groundwater as it passed beneath the barnyard. This resulted in a contribution of 4.4 lb (2.0 kg) of inorganic nitrogen made by the barnyard to the groundwater during the 5-month study period. The concentration of nitrogen was related to the direction of groundwater flow and was dependent on the presence of conditions suitable for the leaching of nitrogen and the dilution potential of the local groundwater flow system. The surface topography proved to be a poor indication of the direction of groundwater flow. (Knapp-USGS)

THE USE OF ARTIFICIAL SUBSTRATES IN POLLUTION SURVEYS,
Federal Water Pollution Control Administration, Duluth, Minn. National Water Quality Lab.
John W. Arthur, and William B. Horning, II.
The Amer Midland Natur, Vol 82, No 1, p 83-89, July 1969. 7 p, 2 fig, 3 tab, 6 ref.

Descriptors: *Bioindicators, *Water pollution effects, *Periphyton, Pollutants, Productivity, Aquatic productivity, Biomass, Ecology, Mapping, Mississippi River, Benthos, Water quality control, Sampling, Chemical analysis, Chlorophyll, Organic matter, Rivers, Biota, Habitats.
Identifiers: Minnesota River, Water pollution surveys.

Artificial substrates were constructed from pressed Masonite board and suspended in the Minnesota and Mississippi Rivers during the summer of 1965. The benthos recovered from the Mississippi River substrates reaffirmed the zones of water quality defined by results from conventional bottom sampling techniques, and analysis of chlorophyll-a indicated a progressive increase in periphyton crop below the major contributors of organic pollution. The numbers and kinds of benthic animals gathered from the Minnesota River substrates differed from results obtained from conventional bottom sampling methods, and suggest that the factor limiting river biota is a lack of suitable natural habitats rather than chemical quality. BIOCHEMICAL OXYGEN DEMAND AND DEGRADATION OF LIGNIN IN NATURAL WATERS,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Div. of Technical Services.
E. W. Raabe.
J Water Pollut Contr Federation, Vol 40, No 5, Part 2, p 145-150, May 1968. 6 p, 3 fig, 15 ref.

Descriptors: *Biochemical oxygen demand, *Oxygen, *Lignins, *Natural streams, Rivers, Carbohydrates, Wastes, Oxidation, Analytical techniques, Pulp wastes.
Identifiers: *Lignin degradation, Kraft mill wastes.

A study of the BOD and decomposition of lignin in natural waters showed that the BOD of a stream polluted with Kraft mill wastes is related to the concentration of carbohydrates, fraction of lignin compounds oxidizable in 100 days, and possibly to other slowly oxidizable organics. The fast component (k= 0.455) of the first stage of BOD represents oxidation of wood sugars and other readily decomposable meterials. The slow component of the first stage and the second stage (k= 0.072 and 0.080, respectively) represent decomposition of lignin and its by-products and other decomposable organics. Less than 50% of the lignin compounds were oxidizable under test conditions over a period of 100 days. (Carstea-USGS)

MONITORING INDUSTRIAL POLLUTANTS BY THE PYROLYSIS-METHANE DETECTION METHOD,
Rocketdyne, Canoga Park, Calif. Research Div.
I. Lysji, Kurt H. Nelson, and P. R. Newton.
J Water Pollut Contr Federation, Vol 40, No 5, Part 2, p 181-187, May 1968. 7 p, 3 fig, 4 tab, 11 ref. Office of Saline Water, Contract No 14-01-0001-332.

Descriptors: *Monitoring, *Industrial wastes, *Pollutants, *Methane, Analytical techniques, Instrumentation, Gas chromatography, Detergents, Organic compounds, Water pollution control, Water quality.
Identifiers: *Pyrolysis-methane method, Hydrocarbons, Alkyl-type carbons.

Industrial pollutants containing methylene and methyl groups in their molecular structures can be monitored by pyrolytic conversion to methane without prior separation from the water. The method is based on the fact that many industrial pollutants have far higher contents of methyl and methylene groups than do natural organics. Pyrolysis is carried out at 600 deg C. A porous glass column separates the methane from the other pyrolytic products and the water vapor for subsequent measurement with a hydrogen flame ionization detector. Rapidity of analysis and high sensitivity are the major advantages of the method. (Carstea-USGS)

Because of its continued production and long half-life, tritium, one of the least hazardous radioactive nuclides, may increase in the environment; as tritiated water, it can be incorporated into body fluids and tissues. This paper is intended to be an information guide for public health agencies. Measurable levels of environmental tritium already prevail from the greatest single source--testing of nuclear weapons. Future tritium releases from reactors and spent fuel processing plants may increase that quantity. The mechanisms whereby tritium may be produced are influenced by reactor type, operating history, design characteristics, and construction materials. Most tritium is released as tritiated water in liquid radioactive waste, usually much less than 1% of the discharge limit specified by the Code of Federal Regulations. Since tritium is not detectable by conventional methods of gross radioactivity analysis, special analytical techniques are required. Analytical results from ten locations indicated, with one exception, that waters downstream from nuclear facilities were not significantly higher in tritium concentrations than stream waters without operating nuclear reactors. Estimates of tritium from nuclear power facilities projected for year 2000, constitute about 5% of maximum tritium activity prevailing in 1963. Tritium releases from operating power reactors are not presently dangerous to health. (Jones-Wisconsin)

CONTRIBUTION OF PHOTOSYNTHETIC REAERATION TO TOTAL REAERATION OF THE PASSAIC RIVER,
Thomas J. Tuffey, and Joseph V. Hunter.
Available from ASME, 345 East 47th St, New York, NY, 10017, for $1.50 per copy, $0.75 to ASME members. Paper presented at American Society of Mechanical Engineers, American Institute Chemical Engineers Stream Pollution and Abatement Conference, June 1969. American Society Mechanical Engineers Publication 69-PID-11. 12 p, 5 fig, 5 tab, 39 ref.

Descriptors: *Photosynthesis, Oxygen demand, Dissolved oxygen, Oxygen sag, Biochemical oxygen demand, Aeration.
Identifiers: Natural aeration, Atmospheric reaeration.

Oxygen balance studies have for many years been one of the major areas of stream sanitation research. In order to better understand oxygen relationships and to accomplish the task of maintaining sufficient oxygen levels in streams, mathematical models and abstractions are essential. Through such investigations, allowable pollutional loads may be evaluated and this information utilized by sewage treatment facilities in populated areas. On the Passaic River, studies were made to evaluate the photosynthetic reaeration in terms of flow conditions, depth, and percent of total reaeration. (Whipple-Rutgers)

AN EXPERIMENTAL RESEARCH OF COEFFICIENT OF LONGITUDINAL DISPERSION FOR SMALL RIVERS (IN RUSSIAN),
Tallinn Polytechnic Inst. (USSR).
H. Velner, L. Paal, and L. Rohusaar.
Sbornik statei po sanitarnoi technike V, Trudy Talinskogo Politekchnicheskogo instituta, Tallin, ESSR, Seria A, p 462-485, Ho 248, 1967.

Descriptors: *Dispersion, *Flow characteristics, Water pollution, Water pollution effects, Mixing, Diffusion, Conducting, Streams, Turbulence.
Identifiers: Longitudinal mixing coefficient.

This work deals with the results of an experimental research of the longitudinal dispersion coefficient for small streams. The coefficient has been determined by experimental means using common salt (NaCl) and measuring electrical conductivity of water. The coefficient of longitudinal dispersion has been calculated: (1) according to the data of maximum concentration of the cloud of pollutant, and (2) according to the change of variance of the cloud of pollutant along the river. The following

has been established: (1) determining the coefficient of longitudinal dispersion by the method of maximum concentrations, as proposed, given reliable results; (2) the coefficient of longitudinal dispersion for small rivers, according to experimental data of the authors, has the magnitude of 0.2 - 1.5 m sq/sec; (3) the coefficient of longitudinal dispersion D for small rivers can be determined with a sufficient accuracy (sigma= plus or minus 20%) as D= 1.5 mu B, where mu is the mean velocity of the stream and B is the width of the stream. OIL POLLUTION AND THE SEA: THE SOURCES OF POLLUTION.

Harv Int L J, Vol 10, No 2, p 316-320, Spring 1969. 5 p, 30 ref.

Descriptors: *Water pollution sources, *Oil, *Ships, Transportation, Natural resources, Oil industry, Accidents, Oceans, Sea water, Cleaning, Oily water, Oil wells, Wastes, Chemical wastes.
Identifiers: *Tankers, *Oil pollution, Ballast, Seeps.

The problem of oil pollution actually began in the early part of the 20th century when naval and merchantile vessels began using fuel oil in place of coal. About the same time, the increased demand for oil for use on land required the importation of large quantities by ship. Each year the number and size of oil tankers has increased to meet this demand. While the discharge of oil by tankers is most publicized during a spectacular disaster like the recent 'Torrey Canyon' incident, the largest portion of oil pollution results from the ballasting and cleaning of ships. The large numbers of tankers and their numerous voyages combine to represent a large source of pollution. Another source is submarine oil wells which occasionally leak. A small amount of oil also comes from shipping sunk during World War II. Finally natural sources contribute some oil each year. (See W70-00786). (Heckerling-Florida)

THE USE OF INVERTEBRATES IN A WATER QUALITY INVESTIGATION: A BIOLOGICAL STUDY OF THE MIAMI RIVER, OHIO,
Stanford Univ., Calif. Dept. of Civil Engineering
P. Jonathan Young.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 304-313, 1967. 10 p, 2 fig, 2 tab, 7 ref.

Descriptors: *Water pollution effects, *Bioindicators, *Water quality, *Dissolved oxygen, *Ohio, Water temperature, Sludge worms, Bloodworms, Aquatic bacteria, Algae, Mayflies, Caddisflies.
Identifiers: Great Miami River (Ohio).

A biological study was made of the Great Miami River, Ohio to determine the factors causing variations in aquatic life. Sampling sites were chosen to vary as little as possible in all characteristics except water quality. The variety of life was most related to dissolved oxygen, and water temperature was the next most important factor. The water pollution conditions were divided into 4 zones. Very polluted: Here, bacteria and protozoans are abundant. Only a few species of animals exist (sludge worms, blood worms, and maggots) and these live on decaying matter or bacteria. Green plants are usually absent. Sewage fungus may occur. Polluted: Bacteria are still abundant and oxygen is low. Green algae begin to appear and bloom, and some of the more tolerant invertebrates and rooted plants are found. Semi-healthy: Algae blooms have usually disappeared. Most of the polluted-favoring organisms are decreasing in abundance while less tolerant species begin to appear. Dissolved oxygen may average 5 ppm or more. Healthy: The animal and plant life is more or less normal. Decomposition continues at a much reduced rate. Dissolved oxygen is high and approaches saturation values. Three insects were chosen to separate the classification zones. The larva of the damselfly Ishnura was chosen to separate 'poluted' from 'very polluted.' The larva of the mayfly Baetis was chosen to separate 'semi-healthy' from 'polluted'; and the caddis fly larva Hydropsyche was chosen to signify the beginning of the 'healthy' zone. Along the Great Miami River, the progression of these invertegrates was found to be very consistent. (Knapp-USGS)

SEWAGE FUNGUS: ITS NATURE AND EFFECTS,
Water Pollution Research Lab., Stevenage (England).
E. J. C. Curtis.
Water Research, Vol 3, No 5, p 289-311, May 1969. 23 p, 9 fig, 1 tab, 132 ref.

Descriptors: *Fungi, *Sewage effluents, *Water pollution, Bioindicators, Bacteria, Protozoa, Water quality control, Dissolved oxygen, Hydrogen ion concentration, Streams, Organic compounds.
Identifiers: *Sewage fungus, Physiological ecology.

An extensive literature dealing with sewage fungus is reviewed. This fungus is a sensitive indicator of organic pollution in water. Sewage fungus comprises a community of bacteria, fungi, and protozoa which are normal inhabitants of rivers and form macroscopic slimes only in polluted water. Illustrations are included for 10 common sewage fungus organisms. The ecology, physiology, and nutrition of the most common organisms are described. The most widespread organisms in sewage fungus are the filamontous bacteria; Sphaerotilus natans received special attention. Taxonomy, morphology, and mineral requirements are discussed and the effects of flow, effects of temperature, effects of pH value, and effects of dissolved oxygen concentration are described. Sewage fungus is likely to develop in places with organic pollution, especially in effluents containing organic nutrients of low molecular weight. The only efficient know method to prevent the growth of sewage fungus is the removal of the nutrients before the effluents are discharged. (Carstea-USGS)

BACTERIA, CARBON DIOXIDE, AND ALGAL BLOOMS,
Wyandotte Chemical Corp., Mich.
L. E. Kuentzel.
J Water Pollut Contr Federation, Vol 41, No 10, p 1737-1747, Oct 1969. 11 p, 51 ref.

Descriptors: *Eutrophication, *Algae, *Nutrients, *Carbon dioxide, *Reviews, Bibliographies, Bacteria, Decomposing organic matter, Waste water (Pollution).
Identifiers: Algal blooms.

A recent literature survey on the subject of lake eutrophication, and algal blooms and nutrients as causative factors, reveals that there is a decided lack of published information on the role of the major nutrient, carbon dioxide. Great emphasis is placed on phosphorus and nitrogen as causative agents in the production of unwanted algal growths, yet a satisfactory accounting for the source of the tremendous amounts of carbon dioxide required for massive algal blooms has not been found in the literature. The purposes of this paper are (a) to provide some logistics on carbon dioxide requirements for such blooms, (b) to establish the fact that such quantities of carbon dioxide are not available from the atmosphere and dissolved salts, and (c) to point out the role played by bacteria and decomposable organic matter. ECOLOGICAL FACTORS AND THE DISTRIBUTION OF CLADOPHORA GLOMERATA IN THE GREAT LAKES,
Wisconsin Univ., Milwaukee. Dept. of Botany.
Richard P. Herbst.
The Amer Midland Natur, Vol 82, No 1, p 90-98, July 1969. 9 p, 3 fig, 1 tab, 15 ref.

Descriptors: *Ecology, *Eutrophication, *Great Lakes, *Algae, Nutrients, Phosphorus, Population, Pollutants, Mapping, Hydrogen sulfide, Cities, Lake Huron, Lake Erie, Lake Ontario, Lake Michigan, Water temperature, Phosphates, Turbidity.
Identifiers: Cladophora glomerata.

Nutrient enrichment in the Great Lakes has provided fertile areas for growth of algal nuisances. One of these species, Cladophora glomerata, has become a major problem for many cities bordering the Great Lakes. Ecological factors concerning its growth in Milwaukee's Harbor were studied, and its distribution in the Great Lakes determined. Phosphorus levels appear to be closely linked with Cladophora increases. (Gabriel-USGS)

ENVIRONMENTAL SURVEILLANCE AROUND A NUCLEAR FUEL REPROCESSING INSTALLATION, 1965-1967,
New York State Dept. of Health, Albany. Bureau of Radiological Health.
William J. Kelleher.
Radiol Health Data and Rep, Vol 10, No 8, p 329-339, Aug 1969. 11 p, 4 fig, 11 tab, 9 ref.

Descriptors: *Environmental effects, *Radioactive wastes, *Nuclear power plants, *Monitoring, Streams, Milk, Watersheds (Basins), Silts, Fish, Deer, Iodine radioisotopes, Public health, Radioactivity, Strontium radioisotopes, Cesium.
Identifiers: *Environmental surveillance, Liquid wastes, Health hazards, Nuclear fuel reprocessing plants.

A summary report of environmental surveillance around the Ashford, N.Y. nuclear fuel reprocessing plant is presented. This report includes data obtained before and after the plant began operations in April 1966. Media monitored included air and milk supplies in the surrounding area; liquid wastes; local watersheds and streams; silt, deer, and fish in the plant perimeter area. Data obtained through 1967 indicate that the discharges from the plant stack have not produced environmental effects from particulate beta-particle emitters or iodine-

131 that might constitute a public health hazard. Surveillance of the streams showed greater concentrations of strontium-90 during the fall and winter of 1966-1967 than in the latter part of 1967. Silt removed more cesium-137 than strontium-90; most of the latter was in the dissolved state. The ratio of cesium-137 to cesium-134 (cesium-134 is indicative of spent fuel) in the wastes was about 4 or 5 to 1. The levels of radioactivity in deer and fish were sufficiently high to require careful evaluation of the public health significance. (Carstea-USGS)

EFFECT OF PHOTOSYNTHESIS ON OXYGEN SATURATION,
Technical School, Nis (Yugoslavia).
Lazar R. Ignjatovic.
J Water Pollut Contr Federation, Vol 40, No 5, Part 2, p 151-161, May 1968. 11 p, 3 fig, 2 tab, 9 ref.

Descriptors: *Photosynthesis, *Oxygen, *Saturation, Temperature, Pressure, Mixing, Evaporation, Supersaturation, Reservoirs, Algae, Bodies of water, Dissolved oxygen, North Carolina.
Identifiers: *Oxygen supersaturation, Vertical mixing, Roanoke Rapids Reservoir (NC).

Temperature changes, pressure changes, vertical mixing of stratified water, and evaporation are discussed and evaluated in order to clarify the phenomenon of oxygen supersaturation in natural bodies of water. Data from Roanoke Rapids Reservoir in North Carolina were used. Supersaturation with dissolved oxygen may be an high as 25% at a 5 ft depth and at an average temperature of 25 deg C. These changes cannot account for observed supersaturation. Some significance to the supersaturation is attached to the effects of sunshine and algal growth. Photosynthesis is the only force capable of producing the supersaturation of such a magnitude. (Carstea-USGS)

GROWTH AND RESISTANCE TO STRESS IN BROOK TROUT FED SUBLETHAL LEVELS OF DDT,
New Hampshire Univ., Durham. Dept. of Zoology.
Kenneth J. Macek.
J Fish Res Board of Canada, Vol 25, No 11, p 2443-2451, 1968. 9 p, 1 fig, 2 tab, 16 ref.OWRR Proj B-001-NH.

Descriptors: *Pesticide toxicity, *Brook trout, *DDT, Fishkill, Morbidity, Mortality, Water pollution effects, Water temperature, Water quality, Nutrients, Fish diets, Nutrient requirements.
Identifiers: DDT tolerance (Trout).

When underyearling brook trout were fed DDT at a rate of 2.0 mg/kg per week for 31 weeks, they exhibited greater weight gain (43.2 g) during the period than did untreated fish (36.6 g). When underyearling fish were fed DDT at different rates for 26 weeks and then starved or fed at a rate equivalent to 10% of the usual feeding rate, the cumulative mortality during this period was 96.2% among fish exposed to 3.0 mg/kg per week, 88.6% among fish exposed to 2.0 mg/kg per week, and 1.2% among untreated fish. Differences in the length of survival of DDT-exposed fish occurred due to dosage, sex, and type of starvation. The evidence suggests that the mortality of DDT-exposed fish was due to the interaction of DDT residues with a combination of environmental stresses, including starvation, decreasing water temperature, and possibly the physiological stress associated with the spawning season. THE UPTAKE, ACCUMULATION AND EXCHANGE OF STRONTIUM-90 BY OPEN SEA PHYTOPLANKTON,
Miami Univ., Fla. Inst. of Marine Science.
E. F. Corcoran, and J. F. Kimball, Jr.
Proc 1st Nat Symp on Radioecology, Colorado State Univ, Ft Collins, Sept 10-15, 1961. Radioecology, Reinhold Pub Corp, N Y and Amer Institute of Biological Sciences, Washington, D C, Schultz, Vincent and Klement Alfred W Jr (Eds), p 187-191, 1963. 5 fig, 4 tab, 7 ref.

Descriptors: *Strontium radioisotopes, *Phytoplankton, Radioactivity, Waste disposal, Nuclear reactors, Powerplants, Ships, Submarines, Effluents, Ion exchange, Resins, Leakage, Cesium, Nuclear explosions, Absorption, Adsorption, Atlantic Ocean, Diatoms, Neritic algae, Ions, Water pollution effects, Water pollution sources, Radioecology.
Identifiers: *Radionuclide uptake, *Radionuclide accumulation, *Radionuclide exchange, *Open sea, Weapons testing, Nuclear Ship Savannah, Zirconium-95, Rubidium-106, Niobium-95, Gymnodinium simplex, Flagellates, Eleuthera Island, Nitzchia seriata, Navicula, Florida current, Yttrium-90, Katodinium rotundata.

Authors used five cultures of oceanic phytoplankton to determine their ability to concentrate strontium (Sr) from sea water, with the objective of ascertaining whether results of studies with neritic and freshwater forms can apply to neritic organisms. The experiments were short-termed, and were conducted during active growth phases to eliminate possibility of nutrient deficiencies and over-population, to minimize bacterial interference, and to emulate natural conditions as closely as possible. All cells grown in media containing strontium-90-yttrium-90 became radioactive. Uptake of Sr was proportional to the concentration of Sr in the medium, cells being able to concentrate radioactive Sr from 18.6 to 381.7 times its ambient concentration. Cell growth, in media containing up to ten times normal concentration of Sr, was not inhibited. Media containing high concentrations of Sr had little effect on ability of cells to accumulate Sr-90. Adsorption was found to play an important role in accumulation of Sr-90. While these results are preliminary, it should be noted that primary producers in marine environments can accumulate Sr-90 from sea water. Controlled laboratory experiments have the advantage of allowing comparisons between various phytoplankters and radionuclides. (See Vol. 2, No. 19, W69-07863.) (Jones-Wisconsin)

Descriptors: *Phytoplankton, *Cycling, *Radioisotopes, Sea Water, Food chains, Phosphorus radioisotopes, Cobalt radioisotopes, Uranium radioisotopes, Nuclear explosions, Strontium radioisotopes, Cesium, Physicochemical properties, Adsorption, Colloids, Zinc radioisotopes, Calcium, Potassium, Clams, Size, Algae, Diatoms, Trace elements, Metabolism, Ions, Chlorella, Water pollution effects, Water pollution sources, Niches, Radioecology.
Identifiers: *Marine environment, Cerium-144, Nitzschia closerium, Artemia, Carteria, North Temperate Zone, Plutonium, Half-life (Radionuclide), Filter-feeding animals, Ruthenium-106, Platymonas, Thalassiosira, Amphidinium klebsi, Porphyridium cruentum, Radionuclide uptake, Nannochloris, Thoracomonas, Yttrium, 'Biological dilution', Physiological condition, Mercenaria mercenaria.

The importance of phytoplankton in cycling radionuclides in oceans depends upon number and concentration of radionuclides accumulated, length of time they are retained by the phytoplankton, size of phytoplankton cells, numbers of cells present in the water, and efficiency of digestion of phytoplankters by filter-feeding animals. The availability of a radionuclide in sea water depends largely upon its physical state (colloidal or particulate) as well as its ionic state. Accumulation is dependent on amounts of the element present in sea water and the quantities of other metabolically similar elements. Binary fission of radioactive phytoplankters in nonactive water results in 50% reduction of activity per cells with each division, termed as 'biological dilution.' Different species of phytoplankton, which accumulate a radionuclide to the same level and are removed from the water with the same efficiency by a filter-feeding animal, may not result in the animal's becoming equally radioactive, for all species of phytoplankton are not digested with equal efficiency. Brine shrimp (Artemia) concentrate radiocobalt to higher levels fed upon radioactive Carteria cells, than when radioactivity is derived from the water. (See Vol. 2, No. 19, W69-07863.) Nature, Vol 220, No 5172, p 1098-1102, Dec 1968. 1 fig, 4 tab, 42 ref.

Descriptors: *Ecosystems, *Water pollution effects, Insecticides, Birds, Enzymes, Reproduction, Chlorinated hydrocarbon pesticides, Canal Zone, DDT, Peregrine falcon, Mexico, Fishes, Gas chromatography, Mass spectrometry, Pacific Ocean, Dieldrin, Antarctic, California, Conservation, Toxicity, Endrin, Colorado River, Mammals, Water pollution sources.
Identifiers: *Polychlorinated biphenylas, *Pesticides, Enzyme induction, Biocides, Calcium metabolism, Reproductive metabolism, p-p'-DDE, Steroid metabolism, Dohrman microcoulometric detector, DDE, Toxaphene, Fat metabolism, Eggshell thickness, Environmental quality, Hawks, Owls, San Francisco Bay, Gulf of Panama, Farallon Island, Baja California (Mexico), Puget Sound, Panama City (Panama), San Diego Bay, Estradiol metabolism.

Authors present extensive tabular data pertaining to the following subjects: chlorinated hydrocarbons in North American peregrine falcons; DDT and polychlorinated biphenyls (PCB) in prey species of peregrine falcons in the Gulf of California; PCB and DDT in the global ecosystem (including species of birds, mammals, and fishes); and increase in oestradiol metabolism in liver homogenates from pigeons treated with various chlorinated hydrocarbons. Analysis of these data indicates that PCB, powerful inducers of hepatic enzymes which degrade oestradiol, are widely dispersed in the global ecosystem. Together with other chlorinated biocides, including DDT, they could account in large measure for aberrations in calcium metabolism observed in many birds after World War II. Authors point out that the relatively small amounts of chlorinated hydrocarbons required to effect changes in reproductive metabolism make those approaches to pollutional ecology based on toxicity data in order of magnitude of parts per million irrelevant. (Eichhorn-Wisconsin)

EFFECTS OF TOXICANTS ON COMMUNITY METABOLISM IN POOLS,
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga.
Walter R. Whitworth, and Thomas H. Lane.
Limnology and Oceanography, Vol 14, No 1, p 53-58, 1969. 2 fig, 2 tab, 6 ref.

escriptors: *Antimycin A, *DDT, *Diquat, Bull-eads, Sunfishes, Plankton.
lentifiers: *Community metabolism, *Community espiration, Bluegills, Diel oxygen techniques.

ates of community metabolism are estimated to est the efficacy of a diel oxygen technique in roviding indices of acute and chronic effects of oxicants. Thirty-eight experimental communities ere exposed to concentrations (in milli-rams/liter) of 0.02 p,p'-DDT (1,1,1-trichloro-2,2 is (p-chloropenyl) ethane); 0.1 antimycin A; 9.2 otassium permanganate; 0.9 and 2.6 formalin; 0.0 nigrosine black; 2.0 and 10.0 malachite green; .1 Diquat and 0.5 and 5.0 copper sulfate. Dis-olved oxygen was measured with an oxygen elec-rode; nutrients were added to bring all pools to a otal hardness of 100 milligrams/liter. Results in-icate that DDT, antimycin A and potassium per-anganate had no adverse effects on community espiration, although DDT and antimycin A were ethal to some plankton and several species of fish Centrarchidae, Cyprinidae, Ictaluridae). The emaining toxicants usually depressed community xygen production and increased community espiration for periods of 1 to 20 weeks. The ethod used is an effective and economical bioas-ay. Tabular data include sample computations and cute effects of toxicants; oxygen metabolism data re presented graphically. (Voigtlander-Wiscon-n)

EASONAL SELECTION OF ESTUARINE BAC-ERIA BY WATER TEMPERATURE,
Rhode Island Univ., Kingston. Narragansett Marine ab.
ohn McN Sieburth.
ournal Experimental Marine Biology and Ecology, ol 1, p 98-121, 1967. 11 fig, 4 tab, 39 ref.

Descriptors: *Bacteria, *Estuarine environment, Water temperature, *Seasonal, Rhode Island, ampling, Ecology, Ammonia, Enzymes, Classifi-ation, Growth rates, Seawater, Incubation, Pseu-omonas, Subsurface-waters, Bottom sediments, urface waters, Detritus, Light intensity, Turbidity, lgae, Diatoms, Cycling nutrients, Physiological cology, Water pollution effects, Phytoplankton.
Identifiers: Narragansett Bay (Rhode Island), Tax-nomic types, Heteretrophy, Bacterial medium, rthrobacter, Flora, Ambient temperature, Ther-al sensitivity, Genera, 'Flavobacterium-ytophaga', Vibrios, Achromobacters, Gram-posi-ive bacteria, Sarcine-like, Bacillus-like, Micrococ-us-like, Psychrophiles, Plemorphic, Myceloid, Coryneform rods, Cocci, Arthrospores, Gram-egative bacteria, Colony development.

Heteretrophic planktonic bacteria were observed n temperature Narragansett Bay, Rhode Island, to stablish whether seasonal water temperature hanges are sufficient to select thermal and tax-nomic types. Population changes were examined n semi-monthly samples and genera determined or 2500+ isolates; growth-temperature spectra of 00 representative isolates at 20 temperatures, 2C C= degrees Celsius) apart, were examined. Growth range of natural bacterial populations aried with water temperature. All thermal types were isolated and population trends observed. Mesophilic isolates (growth above 10C; optimum ave above 30C) were only obtained on plates at 36C when water temperature exceeded 10C. Several mesophiles were cold-sensitive and labile below 18C. Obligate psychrophiles (growth below 16-20C; optimum 9-10C) were only obtained on 0C plates where water temperatures were below 10C. Two additional thermal types were obtained on both 0 and 18C plates. Organisms which grew at 0C (optimum 10-30C) were considered facultative psychrophiles; those which grew at 0C (narrower optimum, 18-20C), psychrotolerant. Besides these major thermal types, a few isolates of several taxonomic groups exhibited tendency for multiple temperature optima. Seasonal selection of thermal types of water temperature occurred in all taxonomic groupings. (Jones-Wisconsin)

ACCUMULATION OF DIELDRIN BY FISH AND SELECTED FISH-FOOD ORGANISMS,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
George G. Chadwick, and Robert W. Brocksen.
Journal of Wildlife Management, Vol 33, No 3, p 693-700, July 1969. 8 fig, 14 ref.

Descriptors: *Dieldrin, *Laboratory tests, *Sculpins, *Tubificids, Bioassay, Midges, Pesticide residues, Water pollution effects.
Identifiers: *HEOD, Cottus preplexus, Tubifiex, Chironomidae, Insecticide retention.

Accumulation rates of a component of dieldrin--1, 2, 3, 4, 10, 10-hexachloro-6, 7-epoxy-1, 4, 4a, 5, 6, 7, 8, 8a-octahydro-1, 4-endo, exo-5, 8-dimethanonaphthalene (HEOD)--from water and food by fish (sculpin) and fish-food organisms (tubificids and midge larvae) were determined under laboratory conditions. Dieldrin was introduced into test aquaria by percolating water through a column of inert material coated with the insecticide. Accumulation and retention of dieldrin was determined by gas-liquid chromatographic analysis for HEOD. Sculpins kept at 15 deg C were exposed to five concentrations of HEOD ranging from 0.017 to 8.60 parts per billion (ppb). Fish were fed a daily maintenance ration (3% of their wet weight) of uncontaminated tubificid worms. Uptake and storage of HEOD at a given concentration is a function of time; accumulation occurred at a nearly constant rate at each concentration, with no evidence of saturation within the exposure period (32 days). Tubificid worms exposed to 80 ppb HEOD (a toxic concentration for fish) had accumulated 365 parts per million (ppm) HEOD at 32 days. Worms containing 150 ppm HEOD retained 62 ppm after 16 days in uncontaminated water. Fish retained lower proportions of available HEOD when their food consumption was greater. Authors conclude that 16% of accumulated HEOD at 21 days was maximum attributable to contaminated food. (Voightlander-Wisconsin)

PESTICIDES AND FISHES--A REVIEW OF SELECTED LITERATURE,
Arizona State Univ., Tempe. Dept. of Zoology.
Donald W. Johnson.
Transactions of the American Fisheries Society, Vol 97, No 4, p 398-424, Oct 1968. 5 tab, 156 ref.

Descriptors: *Fishes, *Pesticides, *Reviews, *Bibliographies, Chlorinated hydrocarbon pesticides, Carbamate pesticides, Organophosphorus pesticides, Inorganic pesticides, Herbicides.
Identifiers: *Literature review.

Author presents a literature review and critique of research to date on pesticide interactions in aquatic habitats. Thirty-four pesticides are considered, with special emphasis being placed on their effects on freshwater and marine fishes; author stresses importance of ascertaining the physical and biological factors that affect toxicity. Data are discussed in terms of mean lethal concentrations--concentrations lethal to 50% of the fish. Literature is reviewed under the general headings: factors affecting toxicity; pesticide residues; effects of pesticides on and in aquatic food chain; action of pesticides on fishes; and pesticide analysis. Field studies have lagged behind laboratory studies and very little work has been done on pesticide effects on invertebrate populations. The need for studies of ecological and physiological effects of sublethal quantities is stressed, in order that realistic tolerance limits of toxic pollutants may be established. THE ISOLATION, PURIFICATION, AND NUTRIENT SOLUTION REQUIREMENTS OF BLUE-GREEN ALGAE,
Wisconsin Univ., Madison. Dept. of Botany.
Gerald C. Gerloff, George P. Fitzgerald, and Folke Skoog.
IN Symposium on the Culturing of Algae, Charles F. Kettering Foundation, Dayton, Ohio, p 27-44, 1950. 6 tab.

Descriptors: *Isolation, *Cyanophytes, *Nutrient requirements, Cultures, Lakes, Algae, Growth rates, Bacteria, Ultraviolet radiation, Actinomycetes, Hydrogen ion concentration, Nitrates, Potassium, Calcium, Magnesium, Iron, Organic matter, Nitrogen fixation, Volume, Streams, Water pollution effects, Eutrophication, Nuisance algae.
Identifiers: *Purification, Culture media, Microcystis aeruginosa, Aphanizomenon flos-aquae, Gloeotrichia echinulata, Coccochloris Peniocystis, Madison (Wis), Chicago Natural History Museum, Nostoc muscorun, Nutrient concentration, Wisconsin, Sulfur, Phosphorus.

Procedures and progress are described in isolating and culturing representative cyanophytes (blue-green algae) and making them bacteria-free. Each species isolated was designated as a permanent specimen in Chicago Natural History Museum collection. Coccochloris Peniocystis requires an unusually high pH for maximum growth. Systematic concentration variation of one element at a time of the basic culture solution showed that higher nitrate concentrations were solely responsible for increased growth. Relationship of phosphorus, sulfur, potassium, magnesium, calcium, and iron were tested. The demonstration indicates that 24 species of cyanophytes can be cultured continuously in inorganic solutions of known composition, evidences strongly that, as a group, they do not require organic substances or unknown factors for normal growth. It appears that nitrogen supply is an important factor in their growth under natural conditions. Coccochloris Peniocystis apparently does not fix atmospheric nitrogen. The

laboratory data probably cannot be applied directly to field conditions since concentrations of essential elements as well as volumes of solution from which algae extract them, are certainly important. Nevertheless, laboratory data should help considerably in determining requirements for optimum growth of cyanophytes in lakes and streams. (Jones-Wisconsin)

BACTERIOLOGICAL EFFECT OF SMALL BOAT WASTES ON SMALL HARBORS,
Washington Univ., Seattle.
Robert W. Seabloom.
Available from the Clearinghouse as PB-187 270, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Washington Water Research Center, July 1969. 20 p, 5 fig, 4 tab, 13 ref. OWRR Project A-024-WASH.

Descriptors: *Boat wastes, *Water pollution effects, Pollution, Fresh water, Seawater, Bacteriological contamination, Recreational watercraft, Washington, Water pollution sources.

Since abatement of land-based sources of pollution is beginning to become a reality, pollution from vessels takes on a greater importance. One aspect of this problem is the overboard discharge of wastes from small recreational craft. Many states and other agencies have taken action to prevent toilet waste discharges from boats into recreational waters. Federal legislation is needed to provide an effective control of wastes from small craft. Data are presented herein from a study of the small pleasure craft pollution of two small bays in the State of Washington. In one, the influence of small boat wastes on the bacteriological quality of fresh water was clearly demonstrated. A review of the present methods for handling sewage from small craft concludes that while additional research is needed to improve the technology, the present systems are considered minimally adequate.

WATER USE AND THERMAL POLLUTION,
EG and G, Inc., Las Vegas, Nev.
Frank C. Di Luzio.
Power Engineering, Vol 72, No 6, p 44-46, June, 1968. 2 tab, 1 graph.

Descriptors: *Aquatic life, *Balance of nature, Water utilization, Pollution abatement, Thermal pollution.
Identifiers: Power industries.

This paper deals with the problem of thermal pollution caused by use of water in power and other industries which use water for cooling and condensing purposes and then return it to waterways. Prevention and control of this waste heat is essential for the protection of present and future uses of our aquatic resources as the delicate ecological balance can be upset by just a small change in water temperature. About 70 percent of the industrial thermal pollution load in the United States today is caused by the steam-electric power industry and it is estimated that by the year 2000 about 7,140,000 billion Btu of heat will be rejected to the rivers compared to 1,164,000 billion Btu in 1958. Important elements of the problem are the increase in toxic effects of chemical pollutants, the increase in oxygen consumption of aquatic vertebrates, a decrease in dissolved oxygen concentration and a decrease in ability of assimilating other wastes. Technological solutions to the problem can be classified into five categories, namely, to minimize the effect of waste heat on the aquatic environment, to reduce waste heat produced in thermal generation, use the waste heat, methods to cool waste heat and non-polluting methods of power generation. (Upadhyaya-Vanderbilt)

THE EFFECT OF TEMPERATURE ON THE ACUTE TOXICITY OF PHENOL TO RAINBOW TROUT IN HARD WATER,
Water Pollution Research Lab., Stevenage (England).
V. M. Brown, D. H. M. Jordan, and B. A. Tiller.
Water Research, Pergamon Press, Vol 1, p 587-594, 1967. 4 fig, 2 tab, 23 ref.

Descriptors: *Phenols, *Toxicity, *Temperature, Resistance, Rainbow trout.

The resistance of rainbow trout to poisoning by phenol increases with increase in temperature up to at least 18 deg C, at which temperature the 48-hour mean lethal concentration (LC50) is almost twice that at 6 deg C. The LC50 value at 6.3 deg C was 5.4 milligrams per liter (mg/l), while at 18.1 deg C the LC50 value was 9.8 mg/l. A similar relationship exists with gas-liquor phenols, common waste products from carbonization of coal. The gas-liquor phenols were found to be more toxic at all temperatures studied than did the pure phenols. (Speakman-Vanderbilt)

THE EFFECTS OF THERMAL EFFLUENTS ON MARINE ORGANISMS,
Virginia Inst. of Marine Science, Gloucester Point.
J. E. Warinner, and M. L. Brehmer.
Air and Water Pollution Int J, Vol 10, p 277-289, 1966.

Descriptors: *Thermal pollution, Biological properties, Benthos, Phytoplankton, Temperature, Ecology, Heated water, Primary productivity.

The assimilation of carbon by the natural phytoplankton populations of the York River is affected by an artificial increase in water temperature. The main conclusion is that the greater the temperature rise, the greater the depression of production. At the highest experienced river temperatures, a 3.5 deg C increase in temperature was sufficient to depress production. This evidence suggests that the range of tolerance to temperature narrows toward the higher natural river temperatures, since only a small temperature rise results in a great reduction in phytoplankton production at river temperature above 25 deg C. The community composition and abundance of marine benthic invertebrates in the river were also affected by the thermal discharge over a distance of 300-400 m from the discharge. This affected area was minimized by the fact that the heated water was less dense and thus stratified. Primary production was forced to increase during the winter months, however, below the power plant. (Novotny-Vanderbilt)

EFFECTS OF INTRODUCTION OF HEATED WATER ON STREAMS (IN GERMAN),
Bundesanstalt fuer Gewasserkunde, Coblenz (West Germany).
M. Eckoldt, H. Knopp, and H. J. Liebscher.
Studie, bearbeitet im Auftrage des Bundesministers fur Gesundheitswesen, Apr 1969. Koblenz. 67 p, 31 ref.

Descriptors: *Thermal pollution, *Thermal power plants, Thermal capacity, Water temperature, Water utilization, *Water pollution effects, Self-purification, Fishing, Dissolved Oxygen, *Cooling water, Biochemical oxygen demand, Heated water, Aeration, Quality control, Water quality, Future planning, Water supply.
Identifiers: Artificial aeration.

This report summarizes possible negative effects of heated waters discharged from electric-steam power stations on streams. The report deals with the physical problems of the introduction of cooling water into streams, with its influence on the oxygen content, self-purification, biological properties, effects on water supply and shipping. The different types of cooling systems are discussed and their influence on cooling water demand is stated. The main conclusions of the report are: (1) Introduction of heated waters prevents ice formation, (2) One must take into account higher evaporation rates both in cooling towers and streams, (3) The decay coefficient for BOD has two optimum values, one at 30-32 deg C and the other at about 40 deg C, (4) Model investigations showed an increase of microbiological activity measured as BOD (2), (5) The introduction of cooling water at temperatures up to 30 deg C or heating of water up to 28 deg C could be tolerable if oxygen is supplemented. Artificial aeration has to be used in most cases, (6) Photosynthesis is influenced to a very low degree by the temperature increase, (7) A proposal for preparing maps of streams showing heat loads for future planning of steam-power stations is presented. FISH AND FISHING AROUND TVA STEAM PLANTS.
Tennessee Valley Authority, Knoxville. Div. of Forestry Development.

TVA Report, Division of Forestry Development, 1969. 8 p.

Descriptors: *Warm water fishing, Temperature, Thermal pollution.
Identifiers: Average catch of fish.

Some of the heaviest fishing in the Tennessee valley takes place in the discharge channels and basins that receive warm water from the condensers of TVA steam plants. Various species have been observed in steam plant discharge channels at temperatures up to 100 deg F. John Sevier, with a discharge area of 6 acres, has the heaviest concentration of fish in the spring but throughout the year there were more fish in the discharge channel than in the river. Bluegill and channel catfish are the principal fishes and average catch of fishermen was 3.5 fish weighing 2.1 pounds per trip and success rate was 62%. Colbert, with fishing area of about 4 acres and discharge temperature of 9-13 degrees above lake temperature, has carpsucker, catfish, shad, carp as the principal fishes. February offered the best fishing followed by November and average catch was 2.5 fish and 1.1 pounds. Bull Run has a 3.5 acre basin and discharge temperature 10-13 degrees higher than lake temperature. The basin has 36 fish species. Both Kingston and Johnsonville discharge 10-14 degrees warmer water. The latter plant discharges to an 80 acre basin. The best months for fishing at Kingston are September, October, and May and average catch is 2.1 fish weighing 1.4 pounds per trip. At Johnsonville, the best months for fishing are October and January and average catch was 1.9 fish weighing 1.3 pounds per 3.8 hour trip. (Upadhyaya-Vanderbilt)

OIL POLLUTION OF THE SEA.
For primary bibliographic entry see Field 05G.
W70-00786

OIL POLLUTION OF THE SEA: THE EFFECTS OF POLLUTION.

Harv Int L J, Vol 10, No 2, p 321-323, Spring 1969. 3 p, 11 ref.

Descriptors: *Water pollution effects, *Damages, *Oil, *Wildlife, Real property, Navigation, Docks, Beaches, Recreational facilities, Marine fish, Marinas, Intertidal areas, Shellfish, Natural resources, Hazards, Aquatic environment, Fishkill, Ecology, Oily water.

Damage resulting from oil pollution falls into two categories; damage to the living resources of the sea and damage to property interests. Among the living resources affected are surface-feeding fishes and shellfish. The greatest problem may be the toxic effects on intertidal animals which serve as

food for larger fish. Large scale oil pollution also injures large quantities of water birds. Taken together, these damages adversely affect the entire chain of life in the marine environment. With respect to damage to property interests, the most noticeable damage is the fouling of recreational beaches and shorefront property. Large quantities of oil are washed ashore each year making beaches unfit for recreation and causing considerable economic loss. Oil spills also create fire hazards around docking facilities and hinder navigation. (See W70-00786). (Heckerling-Florida)

5D. Waste Treatment Processes

COST OF MUNICIPAL SEWAGE TREATMENT,
Illinois Dept. of Registration and Education, Urbana.
William C. Ackerman.
Technical Letter 12, Illinois State Water Survey, June 1969. 12 p, 6 fig, 3 tab.

Descriptors: *Cost analysis, *Construction costs, *Operating costs, *Sewage lagoons, *Operating costs, Mathematical studies.
Identifiers: *Illinois.

Estimating the costs of constructing and operating a municipal sewage treatment facility are possible from the data given. Such costs may be estimated from the regression lines of the figures included; confidence intervals of the best fit lines of regression are given such that the estimates are correct 16 percent of the time. Construction costs are indexed; the base of the index depended on geographical location. A table is included to facilitate comparison of construction costs. Annual unit operating costs in terms of dollars per population equivalent of wastes treated are presented. Also included is the cost of land which represents a significant proportion of capital investment for lagoon construction. Finally, a trend line of the construction cost indices is given so that forecasts may be made. An example is worked out to demonstrate how to utilize the data in estimating costs. (Grossman-Rutgers)

CHEMICAL INTERACTIONS OF WASTEWATER IN A SOIL ENVIRONMENT,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
B. F. Hajek.
J Water Pollut Contr Federation, Vol 41, No 10, p 1775-1786, Oct 1969. 12 p, 9 fig, 20 ref.

Descriptors: *Soil disposal fields, *Water chemistry, *Waste water (Pollution), Water reuse, Biodegradation, Permeability, Soil chemical properties, Soil physical properties, Filtration, Clays, Groundwater movement.
Identifiers: Soil-wastewater relationships.

The performance of soil as a wastewater disposal and water reclamation resource often can be predicted from laboratory data which characterize wastewater, soil, and soil-wastewater relationships. Many parameters must be studied to assess fully the ability of soil to assimilate wastewater. Some of the significant wastewater parameters are: pH, pollutant form and concentration, concentration of accompanying ions, temperature, and volume disposal characteristics. Significant soil parameters are: bulk density, grain size distribution, mineral composition, exchange capacity, and resident exchangeable cations. Soil-wastewater interrelationships are characterized by batch equilibrium and dynamic soil solumn studies. Either theoretical or empirical approaches often can be applied to these data and used to predict pollutant migration rates and concentration distributions. (Knapp-USGS)
W70-00658

NEUTRALIZATION OF ACID MINE DRAINAGE,
Federal Water Pollution Control Administration, Athens, Ga. Southeast Water Lab.
David W. Hill.
J Water Pollut Contr Federation, Vol 4, No 10, p 1702-1715, Oct 1969. 14 p, 4 fig, 6 tab, 12 ref.

Descriptors: *Acid mine water, *Industrial wastes, *Water pollution control, Sulfates, Waste treatment, Neutralization, Sludge, Chemical precipitation, Chemical reactions.
Identifiers: Acid mine waste treatment.

When mining operations remove or penetrate the protective mantle of overburden of pyritic minerals, sulfides are exposed. In the presence of air and water, iron sulfides are oxidized to sulfuric acid and ferric sulfate. A study was designed to determine the possibilities of recycling sludge generated in acid mine drainage neutralization to achieve efficiency and chemical savings. Batch tests were performed on artificial acid mine drainage using ferric sulfate solution, limewater, slaked lime, and artificial dolomitic limestone. Below a pH of 4 previously precipitated sludge settled faster by recycle. Two-step neutralization provided modest savings for dilute solutions. About pH 4, dolomitic lime was a poor neutralizer. No significant benefit was achieved by recycling sludge for neutralization. (Knapp-USGS)
W70-00662

CHEMICAL PROCESSING OF WASTEWATER FOR NUTRIENT REMOVAL,
Stanford Univ., Calif. Dept. of Sanitary Engineering.
Rolf Eliassen, and George Tchobanoglous.
J Water Pollut Contr Federation, Vol 40, No 5, Part 2, p 171-180, May 1968. 10 p, 2 fig, 4 tab, 9 ref.

Descriptors: *Nutrients, *Waste water (Pollution), *Nitrogen, *Phosphorus, Ammonia, Ion exchange, Chemical precipitation, Electrochemistry, Distillation, Sorption, Reverse osmosis, Denitrification, Irrigation, Oxidation.
Identifiers: *Nutrient removal.

Nutrient removal from water, specifically the removal of nitrogen and phosphorus by chemical processes, is discussed. The nutrients can be removed from water by biological, chemical, and physical processes. The biological processes are: (1) algae stripping; (2) anaerobic denitrification; and (3) aerobic processes. The chemical processes include: (1) ammonia stripping; (2) ion exchange; (3) electrodialysis; (4) chemical precipitation; (5) sorption; (6) electrochemical treatment; and (7) oxidation. The physical processes are: (1) land application-irrigation; (2) reverse osmosis; and (3) distillation. In addition to these methods, chemical precipitation and sorption are used for phosphorus removal. The removal efficiencies for nitrogen and phosphorus compounds are 80-98% and 85-99%, respectively. The criteria for designing facilities for nutrient removal are given. (Carstea-USGS)
W70-00680

MECHANICAL RETRIEVAL OF WASTE OILS AND SOLIDS FROM WATER,
Edens Equipment Co., Chicago, Ill.
Robert W. Clyne.
Pap presented at 23rd Annu Meeting Amer Soc Lubricating Eng, Cleveland, Ohio, May 6-9, 1968. 7 p, 9 fig.

Descriptors: *Water pollution treatment, *Oily water, *Separation techniques, Water pollution control, Equipment, Mechanical equipment, Rotors.
Identifiers: Oil separation equipment.

The application of rotating cylinders for the recovery of oil spills from inland waterways and protected harbors, and for the retrieval of waste (free) oils from waste water is discussed. The general design details of permanent, fire-retardant, oil retention floating booms for marine and industrial applications are outlined. Recent developments include compact machinery for the separation of settled solids from waste water, cutting coolants, metal washing solutions, and quenching media. Ejection of the retrieved solids from the water is accomplished in the vertical plane. In contrast to pumped sludges, the solids content of ejected railroad sludges is about 40% by weight. The machine descriptions conclude with the presentation of a primary, mechanical, non-chemical oil-water-solids separator with the capability of reducing total oil content of about 85,000 ppm in waste water influent to an average of less than 100 ppm in the industrial effluent. (Knapp-USGS)
W70-00685

RECOVERY OF WASTE OIL USING FLOATING-TYPE SKIMMERS,
United States Steel Corp., Lorain, Ohio. Tooling and Methods Tubular Products Works.
Harold E. Hillyard.
Iron and Steel Engineer, Aug 1968. 4 p.

Descriptors: *Water pollution control, *Oily water, Industrial wastes, Waste water treatment, Waste disposal, Burning, Fuels, Lagoons.
Identifiers: Waste oil disposal.

Lubricant leakage and spillage that finds its way into a steel plant's sewers is recovered by means of a lagoon with floating-type skimmers. The waste oil is eventually used as a fuel at the plant boiler house. Thus, a satisfactory and economical means of disposal is provided in addition to the pollution abatement aspect. (Knapp-USGS)
W70-00686

PERFORMANCE OF NATURAL-DRAUGHT WATER COOLING TOWERS,
British Electricity Authority. Research Dept.
H. Chilton.
Proceedings of the Institution of Electrical Engineers, Vol 99, Part II, No 71, p 440-456, Oct 1952. 9 fig, 5 tab, 10 ref.

Descriptors: *Cooling towers, Heat balance, Heat flow, Heat transfer, Air circulation.
Identifiers: *Natural draft towers, *Cooling tower theory, Merkel's approximate integration, Water-air ratio, Performance coefficient.

The fundamental theory of natural-draught cooling towers is presented. After a brief general discussion, the work of previous investigators is summarized. A convenient approximate treatment of the transfer process due to Merkel is expressed as a nomogram. The conditions under which the approximations lead to appreciable errors are defined in a form suitable for practical use. The variation of air rate through a natural-draught cooling tower with design and operating conditions is defined by an approximate equation. It is shown that routine design and performance data can be reduced to two dimensionless quantities between which correlation would be expected on theoretical grounds. By considering numerous test results in conjunction with the theoretical relationships it is shown that all tests on a given tower can be represented by a single number, termed the 'performance coefficient' which is substantially independent of tower size and so offers a useful basis for comparison, interpolation and extrapolation between towers of comparable design. The application of the performance coefficient and a related quantity to the solution of practical problems is discussed and illustrated by worked examples. (Ross-Vanderbilt)
W70-00745

OIL POLLUTION OF THE SEA: CLEANING UP.

Harv Int L J, Vol 10, No 2, p 355-359, Spring 1969. 5 p, 18 ref.

Descriptors: *Water pollution control, *Cleaning, *Oil, *Pollution abatement, Detergents, Treatment, Beaches, Oceans, Chemical degradation, Chemcontrol, Project planning, Wildlife conservation, Steam.

Regardless of what type or how many preventative measures are used, oil spills will still occur. The problem then becomes one of how to clean up. The basic aim of any cleanup operation is either to collect the oil or to disperse it over as great a volume of open sea as possible so that bacterial action will eventually destroy it. Detergents are probably the most widely used material for treatment of oil pollution. Unfortunately, they often cause more damage to wildlife than does the oil itself. Attempts have been made to burn oil but this has proved impractical. Recently certain compounds designed to absorb or sink oil have been employed. Thus far these methods have proved to be much cheaper than others and less damaging to marine resources. Another technique useful especially for large spills is dispersant chemicals. One half gallon of such material will dispurse fifty gallons of oil. In relatively calm waters, booms and boats employing skimmers or suction pumps can be used to contain and remove small quantities of oil. Talc and other absorbers and steam cleaning have been used to clear beaches and rocks. To date, there has been a lack of coordination and inadequate knowledge of natural conditions which have resulted in disastrous consequences. (See W70-00786). (Heckerling-Florida)

5F. Water Treatment and Quality Alteration

ECONOMIC EFFECTS OF USING SUBSTANDARD QUALITY WATER IN WEBSTER AND OTHER COMMUNITIES IN SOUTH DAKOTA.
South Dakota State Univ., Brookings. Coll. of Agriculture and Biological Sciences.
For primary bibliographic entry see Field 03C.
W70-00727

5G. Water Quality Control

UNDERSTANDING THE WATER QUALITY CONTROVERSY IN MINNESOTA,
Minnesota Univ., St. Paul. Agriculture Extension Service.
John J. Waelti.
Minn Univ Agr Ext Bull No 359, July 1969. 27 p, 4 fig, 2 tab, 7 photo, 11 ref. OWRR Proj No A-019-MINN.

Descriptors: *Water quality, *Water pollution effects, *Water pollution sources, *Legal aspects, *Minnesota, Economics, Social aspects, Legislation, Governments, Water quality act.
Identifiers: *Minnesota water quality.

Water quality, quality standards, pollution sources, pollution effects, water quality control, and water quality legislation are explained in a publication intended for the use of interested voters. Efforts were made to state the subject matter simply while retaining a high degree of technical accuracy. A growing population with greater affluence, more leisure time, and greater mobility has imposed competing demands on the natural resources of Minnesota. Industrial development and urban growth have accelerated the deterioration of quality in Minnesota's lakes, streams, and ground water supplies. As a consequence of expanding demand, fresh water must be used and reused many times before it returns to oceans or to the hydrologic cycle. Each use generally results in deterioration of water quality. Competition for limited resources gives rise to controversy - and even in Minnesota, which is generally viewed as a 'water rich' state, water is sometimes a very limited resource depending on alternative uses. W70-00430

REDUCING LAND SUBSIDENCE IN THE WILMINGTON OIL FIELD BY THE USE OF SALINE WATERS,
Long Beach Dept. of Oil Properties, Calif.
Robert L. Pierce.
Proc Amer Geophys Union Meeting, Apr 21-25, 1969, Pap H-68, 1969. 11 p, 10 exhibits, 5 ref.

Descriptors: *Injection wells, *Sea water, *Oil fields, *Subsidence, *California, Land subsidence, Withdrawal, Costs, Water pollution control.
Identifiers: Oil field subsidence correction, Water flooding (Oilfield).

The subsidence at Long Beach, California attributed to the Wilmington Oil Field development encompassed an area of 22 sq mi. Subsidence ranged from 2 ft to 30 ft, but the oil field is partially in the tidelands of Long Beach, California, and the Pacific Ocean provided a convenient supply of saline water necessary to correct subsidence by injection of sea water. The injection of saline water has successfully stopped the Long Beach Harbor area subsidence. By 1968, 2.1 billion barrels of saline water were injected into the Wilmington Oil Field. The bulk of this was ocean water produced from source wells open to sands 200 ft to 400 ft deep. The current injection rate of the field is 1.1 million barrels per day. Expanded use of the oil field's produced brine for injection is taking place and 550,000 barrels per day of this brine will replace source well water during 1969. The methods being used to clean the oil field's produced brine include: (1) filtration, (2) recycling through the shallow source water beds, and (3) blending with fresh or other saline waters. (Knapp-USGS)

AIR POLLUTION PUBLICATIONS - A SELECTED BIBLIOGRAPHY WITH ABSTRACTS, 1966-1968.
Library of Congress, Washington, D.C. Science and Technology Div.

For sale by Supt of Documents, US Government Printing Office, Wash DC 20402. Price $4.50. Dep Health, Educ, and Welfare Nat Air Pollut Contr Admin Bibliogr Rep, 1969. 522 p, 1,088 ref, 2 index.

Descriptors: *Bibliographies, *Abstracts, *Air pollution, Air pollution effects, Path of pollutants, Pollutant identification, Legal aspects, Social aspects, Public health.
Identifiers: Air pollution bibliography.

A selective bibliography of air pollution publication by National Air Pollution Control Administration (NAPCA) personnel and other persons and organizations receiving Federal air pollution funds was compiled by the Special Bibliographies Section of the Science and Technology Division of the Library of Congress. The bibliography contains over 1,000 entries spanning the literature of 1966-1968. Previous bibliographies, PHS Publication No. 979 (Revised 1964) and No 979 (Revised 1966) cover the years 1955-1963 and 1963-1966, respectively. The bibliography consists of references, with abstracts, to the literature originated by the staff and grantees of NAPCA on the subject of air pollution published during the period July 1966 through December 1968. The major portion of the material included consists of journal articles. In addition, books, monographs (handbooks, collections of papers delivered at conferences and symposia, etc.) and some report literature are also covered. While the bulk of the material is abstracted from English language publications, certain foreign items (mostly based on PHS grants awarded abroad) have also been included. (Knapp-USGS)
W70-00452

ECONOMICS OF AIR AND WATER POLLUTION.
Virginia Polytechnic Inst., Blacksburg. Donaldson Brown Continuing Education Center.
Virginia Water Resources Research Center, Virginia Polytechnic Institute, Short Course, Apr 28-30, 1969. 303 p, 17 articles, 2 append.

Descriptors: Water quality, Sewage effluents, Cost-benefit analysis, Pollution abatement.
Identifiers: *Economics of water pollution, Externalities.

This publication contains 17 articles, six of which deal with different aspects of water pollution. The areas covered are: externalities and water quality; public versus private goods; effluent changes; waste abatement and U. S. subsidies; selected issues of cost-benefit analysis; and, the measurement of economic losses from uncompensated externalities. One appendix lists the participants in the three day short course and the second appendix lists the biographical information of the speakers. (See also W70-00487 thru W70-00491). (Grossman-Rutgers)
W70-00486

COST-BENEFIT ANALYSIS: SELECTED ISSUES,
Virginia Univ., Charlottesville. Dept. of Economics.
Roland N. McKean.
Virginia Water Resources Research Center, Virginia Polytechnic Institute, Short Course, p 134-146, Apr 28-30, 1969. 13 p, 2 ref.

Descriptors: *Cost-benefit analysis, *Intangible benefits, *Intangible costs, Recreation facilities, Welfare (Economics).
Identifiers: *Externalities, Aesthetic values.

The problem in cost-benefit analysis is the valuation of inputs and outputs of a proposal. Subjective benefits are the spill over benefits or externalities of a project; i.e. beneficial consequences that do not pass through a market and for which there is no direct evidence regarding how much people are willing to pay for them. Possible ways of measuring aesthetic values are: comparing values of projects that contain certain aesthetic characteristics with those projects that do not; consult an expert panel. Recreational services are also subjective benefits, and one method of evaluating such services is to estimate differences in the amounts people are willing to spend for travel to and from the facility. Costs inflicted on others that do not pass through any market are therefore not voluntarily accepted because of an exchange. Such costs are difficult to evaluate. The value of these social benefits and costs depend on the welfare criterion accepted by society. Several virtues of cost-benefit analysis are discussed. (See W70-00486). (Grossman-Rutgers)
W70-00487

THE USE OF SUBSIDIES FOR WASTE ABATEMENT,
Clemson Univ., S.C. Dept. of Economics.
Hugh H. Macaulay.
Virginia Water Resources Research Center, Virginia Polytechnic Institute, Short Course, p 74-99, Apr 28-30, 1969. 26 p, 12 ref.

Descriptors: *Waste water disposal, *Quality control, Taxes, Depreciation.
Identifiers: *Subsidies, Externalities.

The allocation of water among different uses and the maintenance of high water quality are difficult to achieve because of cultural lags, uncertainties over ownership and the right to use streams, and externalities or social costs. Three systems for achieving optimum water quality are: a system of taxes or charges; a system of subsidies; and a system of rules and regulations. Four arguments for subsidies are: (1) pollution abatement equipment does not contribute to production; (2) pollution abatement benefits those downstream; (3) increased costs for abatement may drive some firms out of business; and (4) subsidies produce the same effects as charges do. Five arguments against subsidies are: (1) subsidies cause a misallocation of resources; (2) subsidies encourage greater output;

(3) subsidies do less to encourage the discovery of more efficient means of waste disposal than do charges; (4) the size of a subsidy is more difficult to determine than the amount of a charge; and (5) the form of a subsidy may produce misallocative effects. Two forms of subsidies are accelerated depreciation and tax credits. (See W70-00486). (Grossman-Rutgers)
W70-00488

EFFLUENT CHARGES,
Resources for the Future, Inc., Washington, D.C.
Clifford S. Russel.
Virginia Water Resources Research Center, Virginia Polytechnic Institute, Short Course, p 51-73, Apr 28-30, 1969. 23 p, 4 fig, 12 ref.

Descriptors: *Sewage effluents, *Prices, Decision making, Cost analysis, Management, Discharge (Water).

Economists are interested in effluent charges for they are interested in the manner in which market prices link the complex system of resource allocation. A theoretical examination of the role of market prices and the affect on effluent charges is given. To illustrate how market prices affect effluent charges a simple, illustrative case is explored. The conditions of optimal waste removal are illustrated. Cost functions, including total, average, and marginal costs, are utilized in the discussions. In applying a system of effluent charges the water manager is faced with institutional, political, technological, and economic problems. Such problems are discussed. Effluent charges are useful in the administration of schemes based on stream standards. (See W70-00486). (Grossman-Rutgers)
W70-00489

EXTERNALITIES AND THE QUALITY OF AIR AND WATER,
Carnegie-Mellon Univ., Pittsburgh, Pa. Dept. of Economics.
Otto A. Davis, and Morton I. Kamien.
Virginia Water Resources Research Center, Virginia Polytechnic Institute, Short Course, p 15-20, Apr 28-30, 1969. 15 p.

Descriptors: *Water allocation (Policy), *Cost-benefit analysis, Real costs.
Identifiers: *Pareto optimality, *Externalities.

The costs and benefits associated with any desired level of air and water quality in the context of modern economic concepts are explained. In the allocation of resources, such as air and water, opportunity or real costs are incurred. The criterion of best allocation is pareto optimality which asserts that an allocation of resources is optimal if no reallocation could make some members of society better off without making others worse off. What should be produced and how much are questions not answered by pareto optimality, but by value judgements as transmitted through political processes. The market mechanism allocates resources which are compatible with consumer sovereignty. Perfect competition leads to a pareto optimality equilibrium mix of commodities. Pecuniary externalities exist when the buying decision of an individual affects price. Technological externalities exist when one decision unit affects the decisions of other units. Examples of both types of externalities are given. (See W70-00486). (Grossman-Rutgers)
W70-00490

PUBLIC VS. PRIVATE GOODS,
Virginia Polytechnic Inst., Blacksburg. Dept. of Economics.
Charles Goetz.
Virginia Water Resources Research Center, Virginia Polytechnic Institute, Short Course, p 30-41, Apr 28-30, 1969. 11 p.

Descriptors: *Resource allocation, *Water pollution, Riparian rights.
Identifiers: *Public good, *Private good, Externalities.

Supposedly the normal profit-making incentives of individual trade serves to allocate resources (e.g. air and water) to their most valuable uses. Public goods are goods which embody an interdependency aspect which leads to a serious form of economic decision-making dilemma among individuals. Two conditions by which public goods are: (1) jointness - the ability of one physical unit of the good to provide services to more than one user; and (2) non-excludability-a defect in the property rights attached to a good. Water resources meet these two conditions of a public good. Non-excludability causes individual units to act as if they are unconcerned about pollution in the hope that another agent will clear up the problem. Interdependency also results in a bargaining difficulty called the hold out problem. Decisions as to the use of a public good such as water is based on individual actions. An example is used to explain the principles of a public good. (See W70-00486). (Grossman-Rutgers)

MUNICIPAL CORPORATIONS-WATERS AND WATERCOURSES-EMINENT DOMAIN-POLLUTION OF WATER AS A 'TAKING' OF PRIVATE PROPERTY,
Brooks F. Crabtree.
Mich L Rev, Vol 40, No 5, p 750-752, Mar 1942. 3 p, 13 ref.

Descriptors: *Washington, *Water pollution, *Compensation, *Municipal wastes, Eminent domain, Cities, Judicial decisions, Public health, Riparian land, Land tenure, Sewage disposal, Rivers, Damages, Reasonable use, Legal aspects, Legislation, Public rights.
Identifiers: Constitutional law.

In Snavely v City of Goldendale, 117 P. 2d 221 (Wash 1941), plaintiff sued defendant city for damages caused to his land by the continual discharge of raw sewage into a river upstream from plaintiff's riparian land. The pollution rendered the water of the river unfit for domestic use and dangerous to health. The Supreme Court of Washington held that although the plaintiff failed to allege the necessary elements for a tort action against a municipality, under the state constitution he would have a valid cause of action for damages. The constitutional article provided that 'no private property shall be taken or damaged for public or private use without just compensation having first been made...' In some cases, public necessity and social welfare have been held to allow a municipality to dispose of sewage into natural watercourses even though a private owner would not have a similar right. In some states, a municipality may be given sewage drainage rights by statute, but this right cannot be exercised in such a manner so as to amount to an unconstitutional taking or damaging of the lower riparian owner's property. The practical solution is to give the municipalities a right of eminent domain and allow just compensation for damages. (Heckerling-Florida)

LIABILITY OF LANDOWNERS FOR POLLUTION OF PERCOLATING WATERS,
Robert E. Sharp.
Marq L Rev, Vol 39, No 2, p 119-134, Fall 1955. 16 p, 97 ref.

Descriptors: *Remedies, *Water pollution, *Percolating water, *Relative rights, Water law, Ground water, Subsurface water, Percolation, Subsurface runoff, Subsurface streams, Deep percolation, Ground water movement, Infiltration, Path of pollutants, Seepage, Penetration, Industrial wastes, Sewage, Waste water (Pollution), Legal aspects.
Identifiers: Trespass, Negligence, Nuisance, Strict liability.

The problems associated with pollution of percolating waters has increased with the rapid expansion of residential and industrial complexes into areas which see a high degree of percolated water use. The remedies available to the landowner who finds his water supply polluted fall into four basic areas: trespass, negligence, nuisance, and strict liability. Some jurisdictions do not hold to a right to undefiled waters, basing their opinions on the concept of damnum absque injuria which means a loss without injury. Other jurisdictions hold that there is an unlimited right to use percolating water, and contamination of such water so as to render it unfit for use when it comes onto a neighbor's land is a violation of the neighbor's rights for which an action can be maintained. Once the right to reasonable purity of percolating waters is postulated, the only remaining problem concerns the grounds on which the suit should be brought. Trespass is difficult to rely on, and negligence gives rise to sustaining the burden of proof. Nuisance has certain advantages as it is only necessary to show that the well has been polluted and that defendant has maintained a nuisance that has caused pollution. Strict liability makes the proof of a nuisance almost a matter of fact. (Moulder-Florida)

DEVELOPING STANDARDS FOR THE PROTECTION OF GROUND WATER,
Ray F. Goudey.
Am Water Wks Ass'n J, Vol 39, No 10, p 1010-1020, Oct 1947. 11 p, 3 ref.

Descriptors: *Groundwater, *Water supply, *Water management (Applied), Conjunctive use, Water pollution control, Water pollution sources, Water pollution effects, Adoption of practices, Water conservation, Water resources, Standards, Water quality, Water supply, Water demand, Water requirements, Water utilization, Legal aspects, Water allocation (Policy).

General standards cannot be developed for the protection of all groundwater. Each problem must be solved on its own merits. State agencies have exercised some control over stream pollution since the 1860's. State legislatures have increased the powers of some of their administrative agencies, such as health departments and fish and game commissions, and have in some cases, created new departments. States have joined together in efforts to solve common stream pollution problems. These developments toward increased protection might be followed in regard to ground water protection. The ways that injuries to ground waters may adversely affect domestic, irrigational, and industrial supplies are discussed and examples are given to illustrate them. The necessity of supervisory control over public and industrial uses of ground water is stressed. (Kelly-Florida)

DEVELOPING STANDARDS FOR THE PROTECTION OF GROUND WATER,
Ray F. Goudey.
Am Water Wks Ass'n J, Vol 39, No 10, p 1010-1015, Oct 1947. 11 p, 3 ref.

Descriptors: *Groundwater, *Standards, *Water quality, *Water pollution control, Administrative agencies, Water utilization, Water conservation, Water management (Applied), Water shortage, Water pollution sources, Water quality control, Drainage, Legal aspects, Water policy, Water resources, Planning, Water allocation (Policy), Natural resources.

Groundwater protection is connected with stream pollution control because percolating waters create groundwater which may again reach surface streams. The value of water as a natural resource is inestimable. Groundwater is usually restricted first to domestic, industrial, and irrigational uses and then to conveyance of sewage and industrial wastes underground. Control of pollution has been undertaken by various state agencies. Health departments have borne the bulk of pollution control in the past. Fish and game commissions have also been important agencies for state protection of streams. Industrialized states are adding specialized departments to such agencies. Interstate commissions, such as that created by the Tri-state Compact, also deal in protection of natural watercourses. Few states, however, have specifically included groundwaters in their protective statutes. It is recommended that pollution controls be enacted which encompass the boundaries of entire drainage areas, rather than political boundaries. Commissions should be established for these pollution control areas with powers to review pollution discharges, investigate and plan control works, and set standards of permissible pollution. (Kelly-Florida)

DEVELOPING STANDARDS FOR THE PROTECTION OF GROUND WATER,
Ray F. Goudey.
Am Water Wks Ass'n J, Vol 39, No 10, p 1015-1020, Oct 1947. 11 p, 3 ref.

Descriptors: *Ground water, *Water pollution, *Water pollution control, *Standards, Water conservation, Water policy, Water management (Applied), Administration, Water pollution treatment, Reasonable use, Water quality, Water utilization, Non-consumptive use, Non-structural alternatives, Use rates, Legal aspects, Irrigation, Industrial wastes, Domestic water, Water supply, Water treatment, Classification.
Identifiers: *Artificial pollution, *Natural pollution.

Investigations conducted for ground water protection should differentiate between natural and artificial pollution. Discharge of sewage, use of water for irrigation, and use of fertilizers are among the common interferences by man with ground water supplies. Pollution may affect domestic, irrigational, and industrial supplies in a number of ways, in regard to quantity and quality of ground water available. Problems with pollution of ground water in some cases have become sufficiently critical to require control measures. All factors causing deterioration of the ground water supply should be noted. Some states require detailed plans by industries concerning methods of water treatment. Industry should be required to meet certain standards, but has certain rights which should not be ignored, such as the right to continued reasonable use of surface and ground waters without impairment of quality. The suitability of ground water for domestic, irrigation, or industrial use could be determined through a system of classification. (Kelly-Florida)

POLLUTION OF WATERS OF STATE.

Ind Ann Stat secs 68-517 thru 68-543 (1961).

Descriptors: *Water pollution control, *Indiana, *Eminent domain, *Programs, Legislation, State governments, Water conservation, Standards, Pollution abatement, Administrative agencies, Interstate, Methodology, Decision making, Regulation, Inter-agency cooperation, Pollutant identification, Cost sharing, Condemnation, Grants, Water pollution, Water quality.
Identifiers: *Water Pollution Control Act.

An administrative board known as 'The Stream Pollution Control Board of the State of Indiana' is created. The membership, powers, duties, organization, jurisdiction, and enforcement powers of the board are outlined. Procedures for the determination of pollution standards within the state and the legal sanctions available to insure compliance are provided. Included are both the procedure to be used in determining if violations have occurred and the penalties to be imposed for such violations. Additional powers are given to 'The Stream Pollution Control Board of the State of Indiana.' These powers include the right to represent the state in all matters relating to water pollution and the power to condemn land when necessary to control or eliminate water pollution. (Schram-Florida)

POLLUTION OF WATERS OF THE STATE: THE STREAM POLLUTION CONTROL BOARD OF THE STATE OF INDIANA.

Ind Ann Stat secs 68-517 thru 68-522 (1961).

Descriptors: *Water pollution control, *Indiana, *Administrative agencies, *Treatment facilities, Legislation, Programs, State governments, Water conservation, Standards, Pollution abatement, Methodology, Decision making, Pollutant identification, Supervisory control, State jurisdiction, Inspection, Evaluation, Waste disposal, Waste treatment, Administration, Water pollution, Water quality.

An administrative board known as 'The Stream Pollution Control Board of the State of Indiana' is created. The membership of the board, their compensation, their powers and duties, and the general organization of the board are detailed. The board is given jurisdiction to control and prevent pollution in the waters of this state. To this end, the board may bring any appropriate action in law or in equity in the name of the state of Indiana. After a hearing, the board may order any legal entity to acquire, construct, repair, alter, or extend such plants as may be necessary for the disposal or treatment of matter which is causing or contributing to the polluted condition of the waters of Indiana. The board is given the right to enter any private or public property for the purpose of inspecting and investigating conditions relating to water pollution and may receive all necessary assistance from any state institution to carry out the provisions of this act. (Schram-Florida)

POLLUTION OF WATERS OF STATE.
Ind Ann Stat secs 68-523 thru 68-534 (1961).

Descriptors: *Water pollution control, *Indiana, *Administrative agencies, *Standards, Legislation, Programs, State governments, Water conservation, Pollution abatement, Regulation, Decision making, Methodology, Pollutant identification, Public health, Quality control, Water pollution, Water quality.

Provisions for the determination of water pollution standards and legal sanctions available to insure the maintenance of such standards are set forth. The stream pollution control board is given the power to set these standards and make orders and regulations restricting further pollution. It is made unlawful to cause or allow any such pollution, and the board is given the power to serve notice upon any offender. A detailed procedure for enforcement of this act is outlined, and failure to comply with the orders of the board is made a misdemeanor. An additional fine is provided for each day such polluted condition continues. The power of the board extends to all lakes, rivers, streams, drainage ditches, roadside ditches, underground water, and all other surface and sub-surface water within the state. (Schram-Florida)

COMMENT ON ECONOMY OF WATER QUALITY MANAGEMENT AND POLLUTION CONTROL,
Cornell Univ., Ithaca, N.Y.
Louis Michael Falkson.
IN The Fresh Water of New York State: Its Conservation and Use, p 58-60, Wm C Brown Book Co, Dubuque, Iowa, 1967. 3 p. Edited by Hitchcock, Lauren B.

Descriptors: *Water pollution, *Water pollution control, Economics, Planning, Model studies, Optimization, Water quality, Costs.
Identifiers: Objective function, Benefit function, Loss function, Effluent charges, Water resource planners.

Non-economists in the water pollution control field tend to look for answers from the economist, or some sort of justification for decisions which have already been made. The economist's major potential contribution is the conceptual framework which he can provide for analyzing the problem of water pollution. The concept of optimization is a recurrent and basic economic problem. However, until benefit functions for water quality are esti-

mated, the economist's optimization model cannot be applied. If a second best solution is sought in which certain predetermined stream standards are met at least cost values, a system of effluent charges could achieve the same result and at considerably less administrative cost than existing practices. However, effluent charges are not entirely acceptable and the economist's alternative solutions to the problem are needed. (Loeb-Rutgers)

Identifiers: *Value-based rules, *Quality management, *Welfare economics, Public policy, Calculus, Optimality, Regional-scale opportunities, Utility.

The article is concerned with the useful study of environmental quality problems. Economic studies of these problems fall into four categories: conceptual and methodological studies, empirical evaluation studies, control systems studies, and studies bearing upon desirable institutional change. Knowledge of the economics of alternative systems of management when combined with technical knowledge can be the basis for great opportunities for research and constructive innovations in the areas of politics, law, and administrative organizations. In economic studies, optimum rules, standards, or other techniques for controlling environmental quality must result from analyses of values. If, as often happens, such value-based rules cannot achieve optimal environmental quality management, more direct and explicit collective action on a regional scale is indicated. Finally, appropriate research on how to design suitable institutional and organizational arrangements is needed to implement management systems and procedures suggested by economic and engineering analysis. This article is of interest to the water resource researcher due to the key role he plays in this economic analysis of the environment and also due to the extensive use of water resource studies in the planning process. A 5-YEAR SUMMARY OF THE REGULATORY CONTROL OF RADIOACTIVE MATERIAL IN ARKANSAS,
Arkansas State Dept. of Health, Little Rock. Div. of Radiological Health.
E. F. Wilson, and D. D. Snellings, Jr.
Radiol Health Data and Rep, Vol 10, No 8, p 341-345, Aug 1969. 5 p, 8 tab.

Descriptors: *Radioactive wastes, *Radiation, *Control, *Arkansas, *Regulation, *Monitoring, Safety, Radioisotopes, Inspection, Data collections, Data processing, Safety factors.
Identifiers: Division of Radiological Health.

The State of Arkansas has regulated the use of radioactive material for a 5-year period from 1964 through 1968. This report is a summary of regulatory activities of the Division of Radiological Health. The early (1964) regulatory inspections did not include sufficient data pertaining to the occupational exposure of individuals to radiation; however, the noted deficiencies of records and radiation safety are well documented. In early 1967, the Division of Radiological Health prepared all previous data for electronic data processing, and currently all regulatory inspections, as well as licensing activities, are prepared for electronic data processing on a routine basis. ECONOMIC CONSIDERATIONS RELATIVE TO WATER QUALITY,
William Whipple, Jr.
New Jersey Water Resources Research Institute Report, Rutgers University, New Brunswick, New Jersey. Paper presented at Fifth Annual American Water Resources Association Meeting, Oct 27-30, 1969. 16 p.

Descriptors: *Environmental effects, *Economic benefits, *Intangible benefits, *Water pollution effects, Economic efficiency, Economic justification, Benefits, Water quality, Public health, Recreation, Flow augmentation.
Identifiers: *Recreational environment, *Home environment, *Working environment, *Water quality benefits, Alternative means, Instream aeration.

The Water Resources Council states that benefits of water quality should be evaluated, but little progress has been made. Economists have contributed mostly to evaluation of water based recreation, which is only one of basic aspects. A recent report on the Potomac River based justification upon intangibles only; but this is not satisfactory. Systems analysis and comprehensive planning with multiple objective functions are illusory without evaluation of water quality benefits. Efficiency benefits of water quality could be evaluated under three categories: recreational environment, home environment, and working environment. Some intangibles would remain for consideration.

THE CONSTITUTIONALITY OF EFFLUENT CHARGES,
Wisconsin Univ., Madison.
Silas Robert Lyman.
Thesis, University of Wisconsin, Madison, Wis, May 1969. 269 p. OWRR Project A-022-WIS.

Descriptors: *Legislation, *Riparian rights, *Water law, *Pollution abatement, Effluents.
Identifiers: *Private property rights, *Ad valorem tax, *Navigation provisions, Northwest Ordinance, Water pollution damage.

This thesis examines various constitutional objections which might be raised against effluent charges. An effluent charge was defined as a variable charge imposed on waste dischargers based upon the quality and quantity of waste they discharged and computed upon the basis of the approximate damage done to others by each unit of the effluent. The revenue raised would not be used to compensate injured downstream riparians, but either would defray the costs of a state-operated pollution abatement system or would become part of the general revenue. This definition was used because it raises the more serious constitutional questions. The constitutional questions examined were whether the charge constitutes an invalid exercise of the police power, whether it would constitute a taking of private property rights without compensation, whether the charge system would require an unlawful delegation of legislative power to an administrative agency, whether the charge amounts to an ad valorem tax which must be uniform, whether imposing the charge would violate the freedom of navigation provisions of the Northwest Ordinance and Wisconsin Constitution, whether the charge system would deprive riparians of their common law right to obtain court relief from damage caused by water pollution, whether municipalities had any grounds to object to state-imposed charges, whether the charges could be imposed as an exercise of the federal or state navigation servitude and whether they could be imposed by the state under its power as trustee to protect and manage the waters of the state for the benefit of the public. It is concluded that properly drafted effluent charge legislation would be within the state's constitutional power and would not be subject to the constitutional objections examined. FEDERAL AIR AND WATER CONTROL: THE APPLICATION OF THE COMMERCE POWER TO ABATE INTERSTATE AND INTRASTATE POLLUTION,
Sidney Edelman.
Geo Wash L Rev, Vol 33, No 5, p 1067-1087, June 1965. 21 p, 122 ref.

Descriptors: *Pollution abatement, *Federal jurisdiction, *Clean Air Act, *Legislation, Federal government, Air pollution, Water pollution, Air pollution effects, Path of pollutants, Water pollution control, Water pollution sources, State jurisdiction, Administrative agencies, Navigable waters, Interstate, Governments, Interstate rivers, Riparian rights, Rivers and Harbors Act, Reservoirs, Atmosphere, Public health, Navigation, Aircraft, Legal aspects.
Identifiers: *Interstate commerce.

There must be a constitutional basis for such acts as the Federal Water Pollution Control Act and the Clean Air Act. Under these statutes, the fact that pollution crosses state lines is considered an appropriate basis for the exercise of federal authority, but federal action may be taken only upon request when the effects are limited to the state of the discharge. The validity of abatement of interstate water and air pollution hinges on the determination that the movement of such pollution is itself commerce. That commerce is not limited by economic considerations, that the nature of the material moved is not a factor, and the fact that it is not purposefully directed across a state line is immaterial; Congress can regulate interstate commerce to forbid the use of such commerce to promote the spread of any evil or harm to other states. Control over intrastate water pollution is justified by the appropriate jurisdiction of Congress over both interstate and intrastate navigable waters under the commerce clause, as well as by plenary powers over navigable waters that do not require a commerce nexus. OIL POLLUTION OF THE SEA.

Harv Int L J, Vol 10, No 2, p 316-359, Spring 1969. 44 p, 176 ref.

Descriptors: *Water pollution, *International waters, *Oil, *Oceans, Legal aspects, Legislation, International law, Judicial decisions, Remedies, Damages, United States, Oil industry, Ships, Water pollution control, Water pollution treatment, Water pollution effects, Water pollution sources, Pollution abatement, Accidents, Wildlife conservation, Costs, Disasters, International commissions, Transportation, United Nations, Oil wastes.
Identifiers: *Oil pollution.

The purpose of this comment is to give a brief introduction to the problems caused by oil pollution of the sea and to the response given by the American and international community. Worldwide attention has focused on this problem due to unfortunate recent catastropes like the grounding of the oil tanker 'Torrey Canyon' and the escape of crude oil from the well off Santa Barbara. The author considers oil pollution of sea water from the following aspects: the sources of pollution; the effects of pollution; the response of the international community including the United States and multi-national conventions; the action of the United States; private remedies; the efforts of the oil and shipping industries; enforcement of control by detection; and methods of cleaning up. (See also W70-00787 thru W70-00796). (Heckerling-Florida)

Identifiers: Flag of convenience.

Beginning in the 1920's, the international community tried to find a solution to the oil pollution problem, but action was hampered because the urgency of the problem was not appreciated. More recently, conflicting national interests and problems of enforcement and jurisdiction have hindered a solution. The United States was one of the first proponents of an international conference to deal with oil pollution. Although a conference was held in Washington in 1926, no real progress came forth until the London conference in 1954. The conference promulgated a 15 point convention on oil pollution. The convention met with slow acceptance. In 1962, the London Conference was reconvened and a series of amendments were proposed for addition to the 1954 convention. The conference also adopted a number of resolutions to prevent oil pollution. In spite of these conventions and resolutions, problems of effective detection, prosecution, and civil liability remain. (See W70-00786). (Heckerling-Florida)

OIL POLLUTION OF THE SEA: THE INTERGOVERNMENTAL MARITIME CONSULTATIVE ORGANIZATION.

Harv Int L J, Vol 10, No 2, p 332-339, Spring 1969. 8 p, 19 ref.

Descriptors: *Water pollution control, *International commissions, *Oil, *United Nations, Pollution abatement, Regulation, Administrative agencies, Legal aspects, Oceans, Ships, Compensation, Damages, Project planning, Programs, Jurisdiction.
Identifiers: *Inter-governmental Maritime Consultative Organization.

The Inter-governmental Maritime Consultative Organization (IMCO) is a specialized agency of the United Nations. The IMCO Convention was drawn up by a United Nations Maritime Conference meeting in 1948, but it was not ratified by the requisite number of nations until 1957. IMCO has accepted the responsibilities given it by the 1954 International Convention for Prevention of Pollution of the Sea by Oil. It also undertook the oil pollution functions voted to the UN by a resolution of the 1954 London Conference. During its first ten years of existence IMCO was rather inactive. In 1967, IMCO met in London and initiated study problems in both legal and technical areas. IMCO has now organized a broad program to study the advisability of implementing a variety of new maritime regulations. The Legal Committee of IMCO has been studying various proposals for a multilateral treaty dealing with pollution liability. The draft seeks to establish the liability of a tanker owner for pollution damage caused by the escape of oil from his ship and to provide for an international system of compensation. (See W70-00791). (Heckerling-Florida)
W70-00791

OIL POLLUTION OF THE SEA: UNITED STATES ACTION.

Harv Int L J, Vol 10, No 2, p 338-345, Spring 1969. 7 p, 30 ref.

Descriptors: *Water pollution control, *United States, *Legislation, *Oil, Federal Government, Accidents, Judicial decisions, Pollution abatement, Legal aspects, Oil industry, Legislation.
Identifiers: Oil Pollution Act of 1961, Oil Pollution Act.

The first federal legislation designed to regulate oil pollution was the Oil Pollution Act passed in 1924. The act prohibited the discharge of oil except in cases of 'emergency' or 'unavoidable accident.' The courts had difficulty determining when, in fact, an accident was 'unavoidable.' Not until the United States' ratification, with reservations, of the 1954 London Conference did this nation move forward in the area. The Oil Pollution Act of 1961 implemented the 1954 Convention. Amendments to the 1961 Act were passed in 1966 under the title of Pollution of the Sea by Oil and implemented the provisions of the Convention as amended in 1962. In 1966, amendments were made to the Oil Pollution Act of 1924, making the 1924 Act unenforceable. Several major bills were presented to the 90th Congress. In 1967, the Senate passed the Federal Water Pollution Control Act Amendments of 1967. The Oil and Hazardous Substance Pollution Control Act of 1968 was proposed in the House. Neither of these bills was adopted because of strong oil industry opposition. (See W70-00786). (Heckerling-Florida)
W70-00792

OIL POLLUTION OF THE SEA: PRIVATE REMEDIES.

Harv Int L J, Vol 10, No 2, p 346-350, Spring 1969. 5 p, 19 ref.

Descriptors: *Remedies, *Water pollution, *Oil, *Damages, Adjudication procedure, Judicial decisions, Admiralty, Ships, Legal aspects, Jurisdiction, United States.
Identifiers: Liability, Common law.

Oil spillage may produce substantial damage to private littoral owners and users. The legal remedies now available to persons thus injured have three important aspects: jurisdiction, basis of liability, and scope of liability. The Admiralty Jurisdiction Act of 1948, has in the United States been held to apply to a ship's discharge of oil. Subject-matter jurisdiction would be compatible with several possible forums. The general maritime law of the United States primarily governs in such cases. Admiralty courts have drawn on a body of tort law from the common law of the states. Many common law principles are employed by the admiralty courts. While the measure of damages is also specially determinable by the admiralty courts, common law principles are generally used. One of the major limitations on damages is the value of the shipowner's interest in the ship and the freight 'pending', except where the injury is within the 'privity or knowledge' of the owner. In case of large scale loss, recovery is difficult because the liability fund has been all but destroyed. Imputing knowledge to the owner is also very rare. (See W70-00786). (Heckerling-Florida)
W70-00793

OIL POLLUTION OF THE SEA: THE EFFORTS OF THE OIL AND SHIPPING INDUSTRIES.

Harv Int L J, Vol 10, No 2, p 350-353, Spring 1969. 4 p, 11 ref.

Descriptors: *Water pollution control, *Oil industry, *Pollution abatement, *Insurance, Compensation, Damages, Ships, Waste water disposal, Wastes, Industrial wastes, Water pollution sources, Waste treatment, Waste disposal, Fuels.

The shipping and oil industry have not been completely oblivious to the dangers of oil pollution. The industries have been somewhat willing to enter into voluntary arrangements to control pollution. Recently, a number of preventative steps have been taken by the industry to reduce the discharge of oil into the sea. One of these measures is a system which allows tankers to burn crude oil and 'slope' instead of bunker fuel. The most promising technique to prevent pollution from ballasting and cleaning operations is the 'load-on-top' system. This system takes advantage of the fact that oil is lighter than water. After ballasting and cleaning operations, water is pumped out from the bottom of the mixture, leaving only a small amount of water mixed with the oil. Another example of industry cooperation is the recent organization of tanker owners, the International Tankers Owners Pollution Federation, Ltd, which administers a self-insurance plan to reimburse national governments and the tanker owner members for the cost of dealing with oil spillages. (See W70-00786). (Heckerling-Florida)

WATER POLLUTION CONTROL ACT.
W Va Code Ann, sec 20-5A-1 thru 20-5A-2 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Water quality control, *Standards, Legislation, State governments, Legal aspects, Public health, Water quality, Water resources, Water pollution, Wastes, Sewage, Industrial wastes, Sewage disposal, Water utilization, Quality control, Water pollution effects, Water pollution control.

It is the public policy of West Virginia to maintain reasonable standards of water purity and quality consistent with: (1) public health enjoyment; (2) the propagation and protection of animal and plant life; and (3) the attraction, development, and expansion of business and industry. As used within this article, the term 'water resources' includes all waters on or beneath the surface of the ground, whether percolating, standing, diffused or flowing, wholly or partially within the state, or bordering on the state and within its jurisdiction. The term 'pollution' shall mean the discharge or deposit, directly or indirectly, of sewage or waste in or near waters of the state in such quantity as does, or is likely to either contribute substantially to the contamination of such waters or contribute substantially to the alteration of the physical, chemical, or biological properties of any such waters when such alteration is directly or indirectly detrimental to public welfare, animal and plant life or makes the water unsuitable for commercial, recreational, or other legitimate uses. (Gabrielson-Florida)

OHIO RIVER VALLEY WATER SANITATION COMPACT.
Ind Ann Stat secs 68-601 thru 68-605 (1961).

Descriptors: *Ohio River, *Indiana, *Pollution abatement, *Interstate commissions, Water pollution control, Administration, Public health, Water resources, Inter-agency cooperation, Administrative agencies, River basin commissions, Programs, Interstate compacts, Water pollution, Water quality, Legislation, Standards, Sewage, Waste disposal, Solid wastes, Industrial wastes, Sewage treatment, Treatment facilities, Surveys, Planning.
Identifiers: Water sanitation districts.

The Ohio River Valley Water Sanitation Compact is adopted by Indiana. The purpose of the compact is to control future pollution and to abate existing pollution in the Ohio River drainage basin in order to eliminate the menace to the health, welfare, recreational facilities, and water supplies in said basin. The compact creates the 'Ohio River Valley Water Sanitation District' and establishes the Ohio River Valley Water Sanitation Commission to control water sanitation within this district. Although no single standard is imposed, the states agree that pollution by sewage or industrial wastes originating in a signatory state shall not injuriously affect interstate waters. Water that is to flow into the Ohio is required to be treated so as to completely remove settleable solids and remove not less than 45% of the total suspended solids. In addition, the Commission is empowered to impose a higher degree of treatment if necessary. The Commission is to draft uniform legislation dealing with pollution problems and is to consult with and advise the various states, municipalities, corporations, and persons with regard to the construction of plants for the disposal of sewage, industrial, and other waste. The Commission is empowered to issue orders to any municipality, corporation, or entity discharging sewage or waste into the Ohio River to abate, modify, or treat such discharge. (Schram-Florida)
W70-00826

STREAM POLLUTION.

Miss Code Ann secs 5931.01-5931.04 (Supp 1968).

Descriptors: *Interstate compacts, *Tennessee River, *Water pollution, *Mississippi, Interstate rivers, State governments, Legislation, Water districts, Water law, Pollution abatement, Legal aspects, Regulation, Standards, Control, Financing, Administrative agencies, Coordination, Planning, Political aspects, Costs, Cost sharing, Operating costs, Interstate commissions.

The Tennessee River Basin Water Pollution Control Compact is designed to promote effective control and reduction of pollution in the Tennessee River Basin through interstate cooperation and coordination. An interstate commission shall be created to establish the Tennessee River Basin Water Pollution Control District consisting of all areas drained by the Tennessee River. The Commission shall study the overall pollution problems, recommend legislation, render advice, and after public hearings, recommend minimum standards of water quality. No single standard will be appropriate for all areas or uses of water, and the Commission shall create appropriate standards for each area or use. A state pollution control agency may certify alleged violations of commission standards to the Commission. A hearing will be held, and appropriate recommendations will be made to the state pollution agency. If the recommendation is not followed, the Commission may issue orders that may be enforced in any court of competent jurisdiction. (Darragh-Florida)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

A STUDY OF THE ECONOMIC IMPACT OF WATER IMPOUNDMENT THROUGH VALIDITY TESTING OF A COMPARATIVE-PROJECTOR MODEL,
Texas A and M Univ., College Station. Water Resources Inst.
John E. Pearson, and Kenneth E. Heideman.
Technical Report No 20, Water Resources Institute, Texas A and M University, Aug, 1969. 181 p, 53 tab, 53 ref, 5 append. OWRR Proj B-019-TEX.

Descriptors: *Economics, *Simulation, *Model studies, *Economic prediction, Economic impact, Computer model, Texas, Project planning, Reservoir stages, Simulation.

An established economic simulation model for reservoir development was applied to ten reservoir projects throughout Texas. The model as a predictor of economic impact was given a difficult test because of the diversity of geographic, economic, and social characteristics surrounding the reservoirs. Additional difficulty was provided because the reservoirs were in different development stages--Construction, Fill-up, and Post Fill-up. The simulation model was developed in a previous research effort on two central Texas reservoir areas--Belton Reservoir and Whitney Reservoir--and these areas were retained in the study for check purposes. A third reservoir area--Somerville Reservoir--for which earlier predictions were made was observed for differences between model predictions and actual development. A synthetic (or 'business activity') index was developed for measuring accuracy of the model in the thirteen reservoir areas. Initial applications pointed out weaknesses in recreation projection and total impact calculations. Only partial success with an early application of the model to all reservoir areas necessitated a detailed analysis of all internal model relationships. Revisions were incorporated by using primary data from on-site observations at each area and secondary data from various sources. A reapplication of the model showed the revisions had increased the accuracy for all but two reservoir areas. The revised simulation model provided a systematic and relatively accurate tool for measuring and projecting economic impact surrounding a developing reservoir area. The project data, the results and recommendations of the study are published as Technical Report No. 20 of the Water Resources Institute, Texas A and M University. Copies of the report have been sent to all persons cooperating and furnishing data for the study.

Identifiers: *Plant sizing, *Seasonal product demand, *Linear programming model, Least cost scheduling, Capacity, Inventories, Substitution process, inputs.

This paper presents a method for determining least cost scheduling-investment programs for a firm with a seasonal product demand. The basic problems to be analyzed are the sizing and the timing of the firm's capital investments for plant and equipment. In investment appraisals, one of the most difficult problems is to determine the profitability of each alternative investment. The capital investment problem for a firm with a pronounced seasonal demand pattern lends itself to this type of analysis because the firm may substitute extra shift production, overtime production, or seasonal anticipation inventories for plant capacity. Thus, in developing its annual production plan a firm may substitute current production inputs for capital inputs in the form of buildings and production equipment. An Investment Analysis Model is developed to analyze the substitution process for the capital and the current inputs. A linear programming model of the firm's production smoothing problem is an important element in the Investment Analysis Model and is used to develop an optimum annual production plan for each alternative level of plant capacity. Such a model may prove applicable in the water area when planners are concerned with problems such as investment in water systems where the demand on these systems has significant seasonal variation. RESOURCE QUALITY: NEW DIMENSIONS AND PROBLEMS FOR PUBLIC POLICY,
California Univ., Berkeley.
Michael F. Brewer.
Natural Resources: Quality and Quantity, p 197-212, University of California Press, Berkeley and Los Angeles, 1967. 16 p.

Descriptors: Water pollution, Natural resources, Energy, Oil, Recreation.
Identifiers: *Resource quality, *Public policy, Federal policies, Multiple uses, Federal resource agencies, Objectives, Organizational improvement.

The contemporary emphasis on highway aesthetics, the growing awareness of the problem of water pollution, our increased apprehension of the consequences to human health of smog, have all given rise to a broad public concern with the quality of our environment and its component resources. This concern has stimulated efforts to better understand the problems faced by users of particular resources, as well as by the general public, and to undertake correction measures. This new sensitivity to quality poses new problems for public resources agencies and requires new dimension of public policy. Federal policies and programs for natural resources operate through a complex network of organizations. The attempt to base public programs for resource management on our understanding of an ill-defined goal of quality imposes a heavy burden on the federal agencies, which are slow to respond because of their very complexity. In what way does resource quality enter the domain of public policy, and what are the implications for the programs of resource agencies. The author proposes to identify the requirements imposed on the federal resource agencies by considerations of quality and to suggest ways in which these agencies might accommodate such considerations more effectively in their programs and policies. The important role of water quality in the environmental problem and the responsibilities of the appropriate federal agencies with respect to water quality standards make this article of general relevance to the water researcher. (See W70-00605). (Loeb-Rutgers)

ECONOMIC ANALYSIS OF ALTERNATIVE FLOOD CONTROL MEASURES BY DIGITAL COMPUTER,
Kentucky Univ., Lexington.
Thomas M. Rachford.
Water Resources Institute, Research Report No 1, 1966. OWRR Proj A-001-KY. 157p.

Descriptors: *Economics, *Flood control, *Digital computers, Population, Discount rate, Flood

damage, Costs, Flood plains, Floodproofing, Channel improvement.
Identifiers: Right-of-way value, population projection, open space amenities, sensitivity studies, Input, Output.

A digital computer program is developed in this project for selecting the optimum combination of flood proofing, flood-plain land use, channel improvement, and residual flood damage for a given flood-plain. The optimum policy is selected, based on economic efficiency, for each planning unit of the total flood-plain for each period of time called a planning stage. The program designed for the project was used to test the sensitivity of the optimum combination of measures to variation in discount rates, right-of-way value, population projections, value of open space amenities, adversion to large annual variation in flood damage, costs of restricting flood-plain land use, costs of flood proofing, and costs of channel improvements. It was also used to analyze the effectiveness of land use, flood proofing, and channel improvement used individually and in various combinations. (Loeb-Rutgers)

OPTIMUM ALLOCATION OF WATER RESOURCES BY MATHEMATICAL PROGRAMMING,
Rand Water Board, Johannesburg (South Africa).
David Stephenson.
J Hydrol, Vol 9, No 1, p 20-33, Sept 1969. 14 p, 2 fig, 11 tab, 5 ref.

Descriptors: *Water resources development, *Water allocation (Policy), *Water management (Applied), *Systems analysis, *Optimization, Computer programs, Mathematical models, Distribution patterns, Cost analysis.
Identifiers: Transportation programming, South Africa.

Optimization of water distribution plans is facilitated by transportation programming. For the purpose of compilation of an optimum water supply pattern, costs of conveying water from every possible source of water to each consumer within the system are calculated. The optimization is commenced by initially assuming arbitrary quantities along various routes, and then redistributing the quantities in a routine manner until no further improvement in cost is evident. Application of the technique to minimizing total cost of water conveyance is illustrated with an example. Extension of the method, using the principle of decomposition of linear programs, permits selection of optimum areas for development. Results of a large scale application to the Orange and Vaal River basins in South Africa are presented. (Knapp-USGS)

Descriptors: *Mathematical models, *Optimization, *Parametric hydrology, *Systems analysis, Digital computers, Computer programs, Regression analysis, Mathematical studies, Statistical methods.
Identifiers: Hydrologic systems.

Hydrologic studies and significant advancement in hydrologic understanding are based upon interpretive analysis and hydrologic observations. The rational beginning point of such an inductive process is the construction of a conceptual model. Realistic hydrologic models are not normally simple forms, but the quantification and verification require specialized optimizing methods. Optimum values of the coefficients of mathematical models can be found by an iterative reduction of the residual error of estimates of the coefficient values. Orthogonal corrections to the coefficients are insured by using principal component analysis to regress the error term on a group of correction terms. A digital computer program capable of performing the optimization has been tested on 4 models of varying complexity and used on several fieldscale models. The optimized values of the coefficients are a function of the number of roots used in the solution. Convergence is not a function of the number of observations, feedbacks, random noise, or equation complexity. The optimization method discussed should be applicable in any discipline with significant inputs of interpretive data analysis. (Knapp-USGS)

INSTITUTIONAL FACTORS AND THE TEXAS WATER PLAN,
Texas A and M Univ., College Station. Water Resources Inst.
Warren L. Trock, and Clarence W. Jensen.
Western Agricultural Economics Association, Annual Meeting, Texas A and M University, 1969. 10 p, 17 ref. P.L. 88-379 (Texas). OWRR Proj B-025-TEX.

Descriptors: *Governments, *Jurisdiction, Economic feasibility, Technical feasibility.
Identifiers: *The Texas Water Plan, 1969.

The Texas Water Plan of 1969 presents problems of engineering, economic feasibility, cost-sharing, financing and water pricing, and institutional arrangements. The federal, state, and local governments are concerned with these problems. The federal government will be concerned with matters that affect several states and regions such as water surplus apportionment and cost sharing. The state government is concerned with state-wide problems such as the allocation of water among various uses, pricing policies, and management. Local and county authorities are more concerned with problems which serve local interests such as local water supply, guarding their investments in facilities, and protecting their positions as debtors. FEDERAL NATURAL RESOURCES DEVELOPMENT: BASIC ISSUES IN BENEFIT AND COST MEASUREMENT,
George Washington Univ., Washington, D.C.
Jack L. Knetsch, Robert H. Haveman, Charles W. Howe, John V. Krutilla, and Michael F. Brewer.
Natural Resources Policy Center, The George Washington University, Washington, D.C., May 1969. 12 p.

Descriptors: *Cost-benefit analysis, Social impact, Planning, Federal Government.

Water resource projects by governmental agencies absorb inputs and produce outputs. Therefore, these projects provide the opportunity to measure the benefits and costs. In public projects, all the costs and benefits must be evaluated besides the receipts or disbursements of the agency undertaking the project. Six principles as to the measurement of benefits and costs, based on appropriate economic concepts of social benefits and social costs, are explained. (Grossman-Rutgers)

SUCCESS OF WATERSHED DEVELOPMENT IN LOCAL COMMUNITIES,
P. Thomas Cox.
Natural Resources Journal, Jan 1969, Vol 9, p 23-34. 4 tab, 1 fig.

Descriptors: *Watershed management, *Analysis, Statistical methods, Evaluation, Variability, Regression analysis, Social values, Economics, Decision-making.
Identifiers: Socio-economic analysis, Multiple discriminant analysis, General factor analysis, Multiple regression analysis.

Primarily concerned with the assessment of success and failure, followed by adjustments and adaptations to these findings in watershed projects, this study attempts to discover the causes of disparity in rate of development found between upstream watershed projects. It is hypothesized that social economic data are reflections of man's reactions to his environment, and that if this is true, it is possible to analyze and observe data of community variables in such a way as to categorize or classify communities according to their performance, with performance defined as ability to achieve specified

goals which, in this case, would be development of the community's water resources. The hypothesis is tested by classifying the rate of progress of 115 upstream watershed development projects in Oklahoma, based on the time lag for a project to process through the various stages of development. With rate of progress as the dependent variable and 22 selected socio-economic variables as the independent variables, multiple discriminant analysis, general factor analysis, and multiple regression analysis are applied to the data. In addition, a sample survey of persons actually engaged in project development at the local level is carried out. Through these procedures it is possible to identify and assess factors contributing to the success of development. Differences do exist in rates of progress by communities, and these differences when known, are useful in the establishment of priorities, in providing information for decision-making, and in further study of the reasons for disparity in rates of development. FORECASTING REGIONAL ECONOMIC GROWTH: SOME PROBLEMS AND PITFALLS,
Oregon Univ., Eugene.
James N. Tattersall.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 75-83, Mar 1964.

Descriptors: *Regional analysis, Economic justification, Statistical methods, Population distribution patterns.
Identifiers: Location theory, Outmigration.

There are three broad statistical frameworks generally used today in regional economic studies: there is the regional accounts approach; the input-output approach; and the economic base approach. These techniques are useful devices for classifying information. There is, however, no one simple technique for making predictions or policy judgements almost automatic. Some shortcomings of existing regional studies are noted: (1) the method of defining regions, particularly group-of-states regions. A broad regional study can easily miss significant intra-regional changes; (2) population assumptions based on projecting past trends which accepts population growth as an independent variable. Obviously if employment opportunities do not occur, population growth will be smaller; (3) the assumption that outmigration is undesirable; (4) growth industry hypothesis which fails to recognize the crucial role of production and transportation costs in locational decisions; (5) straight line projections of economic indicators. The characteristics of what the author contends are good regional studies are: (1) use of various statistical frame works and techniques which are not substitutes for analysis; (2) use of location theory; (3) use of economic analyses that are consistent with forecasts for other regions and are sensitive to intra-regional variations; (4) data sufficiently disaggregated; and (5) value judgements about goals of regional growth are clearly specified. (Starr-Chicago)

AREAS OF DEFICIENCY AND RESEARCH NEEDS IN WATER RESOURCE PLANNING,
Henry Stewart.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 101-105, Mar 1964.

Descriptors: *Research and development, Alternative costs, Economic analysis, Water resource management, Political aspects, Social aspects, Public benefits.
Identifiers: Alternative benefits.

Lack of adequate communication is seen as one of the greatest deficiencies in modern water resource planning. Another deficiency in water resource planning is the tendency to use the degree of economic justification as a deciding factor in plan formulation. The benefit-to-cost ratio tends to be maximized at the expense of maximization of conservation, development, and beneficial use of the water resource. To minimize this deficiency, planners must look beyond economic analysis and the benefit-to-cost ratio and recognize current urgent needs and political facts of life so that they can select those projects to be accepted and supported by the public. Problems in research are outlined: (1) who will pay the bill for research - the general public and the ultimate beneficiary of proper water planning, or the immediate user; (2) the question of pure research versus applied research; and (3) economic analyses which do not include comparisons of specific individual projects and alternative projects. (Starr-Chicago)

PANEL DISCUSSION ON WATER QUALITY CONTROL,
Oregon State Univ., Corvallis.
Malcolm H. Karr.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 46-47, Mar 1964.

Descriptors: *Water quality, Research and development, River basin planning, Stream degradation.

The need for developing practical water quality objectives is pointed out. These objectives shouls be realistic for each area under consideration, since few standards would have nationwide applicability. Even individual streams are considered to require different standards for different sections. The successful development of suitable water quality objectives for river basin planning is dependent upon basic and applied research in the field of water. Basic research should be a function of the universities; applied research could properly be undertaken by regional and national laboratories and agencies. (Starr-Chicago)

CONSERVATION AND SOCIAL OBJECTIVES OF COMPREHENSIVE RIVER BASIN PLANNING,
Bureau of Outdoor Recreation, Washington, D.C.
Fred J. Overly.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 48-53, Mar 1964.

Descriptors: Recreation, Benefit-cost ratio, River basin planning, Economic impact, State planning.

The role and objectives of the Bureau of Outdoor Recreation in Comprehensive River Basin Planning is reviewed. Public Law 85-470 established their mission: (1) determining the outdoor recreation needs of the American people in the years 1976 and 2000; (2) determining the resources of the nation to satisfy the need; and (3) determining the policies and programs to insure that the needs are adequately met. A nationwide plan has been developed and technical assistance is given to the States in the preparation of outdoor recreation plans. State plans are a prerequisite for a state to obtain financial assistance under the Land and Water Conservation Fund. Funding would come from recreation users through entrance fees at certain Federal areas; from fuel tax paid on gasoline used in motorboats; from proceeds of sale of Federal surplus real property; and from advance appropriations which would be repaid from the Fund over a period of time. The Bureau's chief responsibility is the integration of recreation planning with other resource planning. While the intangible benefits of recreation are difficult to evaluate on a monetary basis, it can be done. Recreation is a major factor in the economy of the country and particularly in certain regions of the country. In the Pacific Northwest, recreation ranks third in the region's economy. ORRRC determined in its study that recreation contributed more than 20 billion dollars annually to the nation's economy. (Starr-Chicago)

PANEL DISCUSSION ON WATER QUALITY,
Northwest Pulp and Paper Association.
Donald J. Benson.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 43-45, Mar 1964.

Descriptors: *Water quality, Water use, Water demand, Water law, Downstream effects, Industrial wastes.

Contention of the author is that the use of water means a change in water quality, and changes in water quality are almost never an improvement. Therefore, increased demands for water usually means a deleterious effect upon the quality of the water resource. The adoption of severly limiting criteria such as a water quality objective for drinking water is seen as being harmful to any comprehensive plan, since the use of water by industry is inevitable and since the effluents produced by industry are incompatible with drinking water quality. Planners must therefore allow for this use. The accepted rules of water quality control - 'protection of downstream beneficial use' and 'one legitimate use shall not supplant another' are viewed as reasonable rules. They are not adequate, however, for determining what bodies of water shall be allowed to have more use than others. Nor are they enough to establish reasonable criteria for heavy industrial use that will not tend to block future expansion of industry into an area. The establishment of water quality control law based on water criteria objectives rather than set standards is proposed as the method of implementation of adequate plans. (Starr-Chicago)

PANEL DISCUSSION ON WATER QUALITY,
Geological Survey, Washington, D.C.
L. B. Laird.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 40-42, Mar 1964.

Descriptors: *Water quality, River basin planning, Technological impact, Research and development.

Basin planning has one goal, for the full development of water resources, the full economic development of the basin while maintaining a suitable quality of water to meet the varying demands. The basin planner needs to know: (1) the present quality of the water resources; (2) data on the current water qualitydemands; (3) future demands; (4) knowledge of the impact that changing water use will have on water quality; and (5) knowledge of the hydro-geologic system of the basin. Research needs outlined are: relationships between solutes, sediments and biota; influence of municipal waste disposal; and influence of reservoir storage on water quality. (Starr-Chicago)
W70-00505

WATER QUALITY OBJECTIVES,
Keith S. Krause.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 34-37, Mar 1964. 1 tab.

Descriptors: *Water quality, Water utilization, Economic feasibility, Standards reliability.
Identifiers: *Goals and objectives.

Author defines water quality as being good when it does not interfere with legitimate uses and as being poor (in various gradations) when it interferes with some or many uses. While it is difficult to describe what is really meant by water quality, the author feels it is necessary to develop a rational means of measuring water quality and what objectives or goals shouls be considered. Congress has established two laboratories for determining the detrimental effects of pollutants. Since not all the necessary scientific information on these pollutant-

use relationships are known, goals will have to be determined in a subjective manner. Furthermore, it will be necessary to judge the established goals as they relate to present and probable future water uses at specific locations. In attempting to make the judgments, user groups and regulatory groups are examining the evidence and helping to establish desirable objectives. The development of an economic rationale for determining the economic value of comparative water qualities is seen as an essential process in the preservation and conservation of the water resource. (Starr-Chicago)

A MEASURE OF WATER RECREATION BENEFITS: THE MERAMEC BASIN EXAMPLE,
Edward L. Ullman.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 15-29, Mar 1964. 3 tab, 7 fig.

Descriptors: *Recreation, Benefit-cost ratio, Reservoirs, River basin planning.
Identifiers: Meramec Basin Project.

A description of an approach to assigning a value to an intangible activity such as recreation, using the Meramec Basin Project, outside of St. Louis, as an example. A principal conclusion reached is that the benefits from recreation vary from place to place, in relation to size of market and lack or alternative opportunities, and that, therefore, recreation is not as important a purpose for some regions as it is for others. In St. Louis, an area where there is little alternative opportunities for water recreation, it was necessary to determine if there was justification for creating a large body of water for such a purpose. Surveys were conducted to see where St. Louis residents were presently going for their water recreation and to determine their reactions to a new reservoir closer to home. An attendance prediction model was developed from the results of the surveys, and this in turn, was translated into dollars of benefits. Dollar values were assigned to savings in mileage, and time, and estimates were made of what monetary benefits would derive from an admission charge. A figure of $4,728,000 was derived as the total figure of benefits to be derived from the creation of a new reservoir. It is important to note a one visitor day benefit figure cannot be developed; each reservoir requires a different figure for individual benefits as well as attendance prediction. (Starr-Chicago)

PERSPECTIVES ON ENVIRONMENTAL PLANNING AND RESOURCE DEVELOPMENT,
Michigan State Univ., East Lansing.
Sanford S. Farness.
IN Water Resources Planning in Illinois, Illinois Board of Economic Development, Illinois Conference on Water Resources Development, 1964. p 6-12.

Descriptors: *Environmental engineering, Decision making, Water resources development, Social aspects, Regional analysis, River basins.
Identifiers: *Environmental planning, Regional planning.

The recent regional spread of urban settlement, commuting patterns, labor supply and market areas are compelling cities to be concerned with regional factors in meeting the increased needs for urban land, water disposal, flood control, forests, parks and open space. Water resources and water-connected problems are now strategic factors in environmental design. The strategic importance of water resources as a man-environment relationship now and as a critical factor in future development raises to new prominence the river basin region. In this framework, the elements and systems of nature and society emerge as interdependent factors. Environmental planning, which includes physical, biological and social space planning is set squarely in a cultural value, human community and landscape-creating context and is slowly being defined as a process. The key problems to be overcome are: 91) that concepts and methods utilized in projecting population and economic change are inadequate and ignore policy-making determinants; (2) unbalanced economic perception and thinking based upon meeting the demands of production and consumption; and (3) exclusion in the planning process of intangibles such as justice, freedom, emotional and ecological fitness, and beauty. (Starr-Chicago)

THE FEDERAL COMPREHENSIVE SURVEYS,
Roy T. Dodge.
IN Water Resources Planning in Illinois, Illinois Board of Economic Development Illinois Conference on Water Resources Development, p 12-14, 1964.

Descriptors: *Water resources development, *River basin development, Economic efficiency, Project planning, Social function.
Identifiers: *Upper Mississippi River Basin, Economic base studies.

A brief background of river basin planning is presented. Comprehensive basin planning is one phase of the General Investigation program of the U.S. Army Engineer Corps; the other phase is the specific detailed project surveys designed for project authorization and construction. A description of the planning effort for the Upper Mississippi Basin is given. Three general aspects of this effort are: (1) planning objectives; (2) methodology of planning; and (3) current status and anticipated results. In terms of the first aspect, the ultimate objective is to contribute to the improvement of the economic and social climate of the Upper Mississippi Valley through: (1) increased production of agricultural products through control of flood waters and soil erosion and proper land use; (2) storage of surface waters to reduce flood damage and provide water supply; and (3) provision of fish and wildlife and recreation areas. The methodology employed for the Upper Mississippi Basin consists of four principal phases: (1) appraisal of the current and prospective economic potential of the basin; (2) the projections for this potential is then translated into needs for the control, regulation and use of water and related land resources; (3) examination of the water and land resource available in the basin to meet projected needs; and (4) comparison of the resources and land capabilities with the needs developed from economic projections which results in an assessment of the potential improvements best suited for the timely development of those resources to satisfy present and projected needs. The planning effort is accomplished through the efforts of eight work groups organized on a functional basis. (Starr-Chicago)

PLANNING FOR WATER RESOURCE DEVELOPMENT: THE FORMULATION OF A STRATEGY,
Northwestern Illinois Planning Commission.
Matthew L. Rockwell.
IN Water Resources Planning in Illinois, Illinois Board of Economic Development Illinois Conference on Water Resources Development, p 15-16, 1964.

Descriptors: *Water resources development, Groundwater, Surface waters, Land use.
Identifiers: *Metropolitan planning, Northeastern Illinois.

The unique characteristics of metropolitan areas make it desirable to approach planning for water management on a metropolitan scale. There are at least four characteristics of metropolitan areas which distinguish them from other types of planning units: (1) metropolitan areas represent economic units with internal linkages strong enough to offset the divisional features of the physical environment, e.g., drainage basins and surface streams; (2) metropolitan areas give rise to a wide diversification of demands that are concentrated in a limited area and which frequently exceed the available resource; (3) myriad of governments having fragmented authority from the standpoint of both area and functional jurisdiction; (4) the large concentration of population and industry in metropolitan areas and the accompanying human and financial resources makes possible bold programs for management of water resources. Northeastern Illinois with an average daily inflow of about 10 billion gallons per day appears to be rich in water resources. However, the capture and efficient use of this continuously renewing resource can be realized only through comprehensive water resource development and management. The major elements of the metropolitan water system which have potential for management and which are of sufficient quantity to be of regional significance are: surface water inflow from beyond the metropolitan area, groundwater, and surface water runoff from rainfall and evapotranspiration. Seven policies are outlined which are the basis of a strategy of development and management of the water resouce in Northeastern Illinois. The seven policies will be reflected in a land-use plan being developed by the Northeastern Illinois Planning Commission. (Starr-Chicago)

MAKING THE STATE AN EFFECTIVE PARTNER IN WATER DEVELOPMENT,
Cornell Univ., Ithaca, N.Y.
Leonard Dworsky.
IN Water Resources Planning in Illinois, Illinois Board of Economic Development, Illinois Conference on Water Resources Development, p 16-21, 1964.

Descriptors: *Federal-state water rights conflict, *State jurisdiction, State governments, Local governments, Water resource development.
Identifiers: National needs, Regional needs.

The history of the role of the States in water resource development is presented. Areas of involvement in the past included: (1) canals and internal improvements; (2) land reclamation, drainage and improvement of water courses; (3) water supply; and (4) water law. Today states play a broad role within the federal system in connection with many aspects of water resources planning, although this role has been largely overshadowed by Federal water resource development efforts. The areas of involvement today include: (1) municipal and industrial water supplies; (2) agricultural water supplies; (3) water pollution control; (4) soil and water conservation; (5) watershed development and recreational development; (6) basic data collection; (7) legislative provision for water and related land developments at local and regional levels; and (8) interstate cooperation on water allocation, water supply and pollution control. Most of these roles have been enacted, for the most part, largely within state boundaries, often with inadequate coordination between state agencies, and with unclear objectives. Recommendations are made for strengthening state water resource programs. A strong state program is seen as reflecting three aspects: (1) the desires and needs of its citizens; (2) a greater responsibility to insure that local government effort is timely and consistent with the state development program; and (3) a relating of the state needs to longer regional and national needs. (Starr-Chicago)

DEVELOPING POSITIVE PUBLIC ATTITUDES FOR WATER RESOURCE DEVELOPMENT,
Frank P. Zeidler.
IN Water Resources Planning in Illinois, Illinois Board of Economic Development, Illinois Conference on Water Resources Development, p 21-25, 1964.

Descriptors: *Attitudes, *Political aspects, *Social aspects, Research and development, Technology.
Identifiers: *Voluntary organizations.

As a result of rapid population and industrial growth, water has become the Nation's No. 1 natural resources problem. The author's contention is that the main problem in water resource development is how to motivate enough people to do something about the problem. The reluctance of local government is often accompanied by the unwillingness of state government agencies to carry out the mandate of their statutory authority to enforce water pollution control and abatement of nuisances. This enaction on the part of local and state government places pressure, therefore, on Congress for water pollution control. The author views an aroused public as the prime requisite for getting both public officials to act and for private action. Voluntary organizations supply the support that the legislator needs to favor a cause and promote legislation. Political leaders, however, must not await the initiation of action by voluntary organizations. They too can institute change by educating the public, particularly during political campaigns. Another source for positive actions can originate with the technical people and their organizations. These organizations possess detailed knowledge of water resource development problems and must speak out on the problems and make suggestions for their solution. (Starr-Chicago)

WATER RESOURCE INFORMATION FOR PLANNING AND MANAGEMENT,
Illinois Geological Survey.
John C. Frye.
IN Water Resources Planning in Illinois, Illinois Board of Economic Development, Illinois Conference on Water Resources Development, p 40-42, 1964.

Descriptors: *Illinois, *Water resources development, Geologic investigations.
Identifiers: *Illinois State Geological Survey, *Water resources planning.

Described are the general responsibilities and program of public service of the Illinois State Geological Survey. Physical data supplied by this state agency serves as an aid to planning groups throughout the state. Examples of surveys and services carried on by the agency are: (1) survey of economic resources for the Division of Industrial Planning and Development; (2) survey of water resources planning for the Water Resources Committee of the State Chamber of Commerce; (3) served as member of the Technical Advisory Committee on Water Supply and Waste disposal of the Northeastern Illinois Planning Commission; (4) investigated the geologic problems of Northeastern Illinois as part of a water resource study; and (5) conducted a geologic survey for the Board of Economic Development for a state-wide water resources development plan. The future program of the agency will include more integrated geologic studies that will be of assistance for pollution and contamination control, mineral resource development, design of civil works, and land use. These studies go beyond the immediate problem of water resources to the broad field of basic data for regional planning for economic growth. (Starr-Chicago)

COMMENT ON THE PLACE OF WATER RESOURCES PLANNING IN ECONOMIC REGIONAL DEVELOPMENT,
Northwestern Univ., Evanston, Ill.
Robert S. Gemmell.
IN The Fresh Water of New York State: Its Conservation and Use, p 182-183, Wm C Brown Book Co, Dubuque, Iowa, 1967. 2 p. Edited by Lauren B. Hitchcock.

Descriptors: *Planning, Economics, Investment, Water resources development, Census, Water quality, Costs, Prices.
Identifiers: *Economic regional development, Water resource planner, Regional planner, Regional development, Social overhead capital, Water quantity.

Water resources planning plays a diffuse role in economic regional development. It is an essential activity, but its contribution is difficult to ascertain. Consequently, the water resources planner must be prepared to serve as advisor to the regional planner. He must assist in the formulation of the water resources portion of the regional development plan. Such a plan, however, is not static; it is evolutionary. As such, the water resources planner must devise numerous schemes for development of this resource and make known to the regional planner the consequences of implementing these schemes. He must prepare a 'catalog of merchandise' so that the regional planner can shop intellectually and purchase those items which best serve the region's economic and social interests. (Loeb-Rutgers)

EFFICIENCY IN GOVERNMENT SPENDING,
Netherlands School of Economics, Rotterdam.
W. Dress.
Public Finance, Vol XXIII, No 1-2, p 1-47, 1967.

Descriptors: *Government, *Budgeting, *Cost-benefit analysis, Taxes, Prices, Costs, Economic analysis, Values, Economic efficiency, Income, Debt, Conservation, Water resources, Financing, Roads, Education, Agriculture
Identifiers: *Public finance, *Spending, Stabilization program, Budgeting, Collective goods, Income transfers.

This study is concerned with the evaluation of the area of public finance. The ideas governing expenditures, the concept of maximizing a social welfare function and the distribution of income are among the topics discussed. Program budgeting is studied and a significant section is devoted to the role of cost-benefit analysis. The section on collective goods discusses the economics of such areas as defense, police protection, conservation, basic research and foreign aid. The chapter on infrastructure contains a section on water resources relating the state of the art of public finance in that area as well as some of the problems. Income transfers are discussed, the concept of elasticity in the area is explained along with the different types and aims of income transfers. In addition to the section directly devoted to water resources, much of the theory of public finance applied to other areas has application in the public water resource area. (Murphy-Rutgers)

ANTICIPATING THE NATIONS NEED FOR ECONOMIC KNOWLEDGE,
National Bureau of Economic Research, New York.
Geoffrey H. Moore.
46th Annual Report, National Bureau of Economic Research, p 1-5, June 1966. 5 p.

Descriptors: *Economics, *Forecasting, Government, Measurement, Employment, Prices, Costs, Profits, Data collections.
Identifiers: *National Bureau, *Economic research, *Research policies, Business cycles, Borrowing.

The article seeks to explain the role of economic research in anticipating the nation's needs for basic information. The significant results of economic research are usually realized in the distant future. The author gives some examples of research which proved very useful a considerable time after its completion. The author tells of Thorp's work on business cycles as a prime example and briefly describes four recently published works that are likely to find important application in the years to come. The research policies of the National Bureau are described as an example of ones which provide the necessary soundness as well as flexibility. The large amount of economic research necessary for present and future water resource problems necessitates the understanding of the purposes and justification of research. This article provides a general argument for extending and supporting this research. (Murphy-Rutgers)

GOVERNMENT RESEARCH AND DEVELOPMENT PROGRAMS,
Princeton Univ., N.J. Dept. of Economics.
Frederick M. Scherer.
Measuring Benefits of Government Investments, Washington, The Brookings Institution, p 12-70, 1965. 59 p, 5 fig, 3 tab, 48 ref. Edited by Dorfman, R.

Descriptors: *Research and development, *Federal government, *Economic analysis, Investment, Risks, Benefits, Costs, Decision making, Income, Budgeting.
Identifiers: *Tradeoffs, *Cost-effectiveness, Market, Substitution, Marginal returns, Utility function, Time-cost.

This article deals with two distinctive aspects of government research and development programs. The first aspect concerns itself with the intangible benefits of such programs which are difficult to assess in a monetary common denominator. The second aspect concerns research and development investment decisions which encompass 'tradeoffs' that have few close parallels in non-research activities. This article examines the problem of measuring research and development program benefits in a nonmarket environment, emphasizing the role of benefit estimates in time-cost tradeoff decisions. A convex development possibility function is assumed in an attempt to gain better information on the benefits and costs of research and development programs since such information would lead to improved resource allocation decisions. Due to the importance of benefit evaluation in the water resource field, this article is of interest to the water researcher. (Murphy-Rutgers)

MEASURING BENEFITS OF GOVERNMENT INVESTMENTS.
Harvard Univ., Cambridge, Mass.

Washington, DC, The Brookings Institution, 1965. 429 p. Edited by R Dorfman.

Descriptors: *Government, *Investments, *Resource allocation, Accidents, Cost-benefit analysis, Capital, Costs, Decision-making, Federal government, Public health, Income, Marginal cost, Pricing, Measurement, Recreation, Research and development, Taxes, Transportation, Urban renewal, Water resources, Welfare economics, Government supports.
Identifiers: *Subsidies, *Development programs, Public expenditures, Land Water Conservation Bill, Time-cost tradeoff.

This book is a compilation of papers and discussions designed to explore the problems of appraising the benefits that are likely to accrue from proposed public investment projects. The areas covered include research and development expenditures, outdoor recreation projects, education programs, federal aviation, highways, urban renewal and public health programs. The general feeling was that benefits of such government investment projects could be appraised objectively and even quantitatively. This was based on skillful application of benefit-cost analysis, which had been developed in the past thirty years mostly for application to water resources development. Both because of this factor and due to the fact that other methods of benefit evaluation pertinent to water resources are presented, this book is of special use to the water resource researcher. OUTDOOR RECREATION,
Institute of Public Administration, Washington, D.C.; and National Planning Association, Washington, D.C.
Ruth P. Mack, and Sumner Myers.
Measuring Benefits of Government Investments, Washington, The Brookings Institution, p 71-116, 1965. 46 p, 2 tab, 28 ref. Edited by R Dorfman.

Descriptors: *Recreation, Cost-benefit analysis, *Measurement, *Forecasting, Mathematical studies, Market, Government, Conservation, Resources, Shoreline, Prices, Swimming, Lakes, Public lands, Investment, Input-output analysis.
Identifiers: *Merit-weighted user days, *Utility, *Dollar measure, Beach clubs.

This article explores concepts and methods for providing a useful measure of the benefit derived from government expenditure on outdoor recreation. Such benefits are measured in terms of merit-weighted user-days of outdoor recreation. Two ways are discussed of attempting to arrive at an estimate of current benefit to be derived from a given amount of current expenditures on outdoor recreation. The dollar value approach is limited for intra-program analysis, since market prices are least suitable where most needed and the price/benefit relationship is uneven for different types of recreation and people. This approach becomes more valuable if user-prices are charged for public recreation facilities. The approach of a measure in terms of a merit-weighted service unit seems to improve intra-program decisions, since it can utilize hard information and can accommodate value judgments about noncommensurables. Inter-program comparisons are also aided by this approach. Due to the important relation between water resources and outdoor recreation, this article is of interest to water resource researchers concerned with benefit measures for water oriented recreation projects. THREE ESSAYS ON THE STATE OF ECONOMIC SCIENCE,
Tjalling C. Koopmans.
New York, McGraw-Hill Book Company, Inc, 1957. 231 p.

Descriptors: *Economics, *Resource allocation, *Mathematical models, *Mathematical studies, Measurement, Statistical methods, Statistical models, Profit, Supply, Prices, Equilibrium, Income, Economic efficiency, Linear programming, Input-output analysis, Time, Capital interest, Methodology, Psychological aspects, Model studies, Return to scale, Sites, Decision making, Risks, Preferences.
Identifiers: *Economic knowledge, *Price system, Economic theory, Empirical investigations, Mathematical concepts, Statistical concepts, Mathematical economics.

This volume is composed of three essays which are concerned with questions of substance, of method, and of tools in the area of economics. The author offers an explanation of some recent developments in economic theory, comments on the character and the basis of economic knowledge, and offers his ideas about the possible direction of future work in theory and in empirical investigations. The essays concern the parallel development of economic theory and economic observation and measurement in order to increase man's understanding and society's control of economic conditions. More particularly, they concern the development and use of mathematical and statistical concepts for these purposes. The first essay attempts to communicate the logical content and some of the underlying reasoning of certain recent developments in mathematical economics. The second essay urges a clearer separation, in the construction of economic knowledge, between reasoning and recognition of facts. It recommends the postulational method as the principal instrument of separation. The essay further explores various directions in which the postulates of economic theory could be modified and refined in order to recognize more aspects of reality. The third essay considers the interaction between tools of analysis and the choice of problems in economics. As such, this book presents numerous points of interest to the general economist including those individuals involved in theoretical and empirical treatment of water resources. (See also W70-00631 and W70-00632). (Loeb-Rutgers)

ALLOCATION OF RESOURCES AND THE PRICE SYSTEM,
Yale Univ., New Haven, Conn.
Tjalling C. Koopmans.
IN Three Essays on the State of Economic Science, McGraw-Hill Book Co, Inc, New York, p 1-126, 1957. 126 p, 41 fig.

Descriptors: *Economics, *Resource allocation, Profit, Supply, Prices, Equilibrium, Income, Economic efficiency, Linear programming, Input-output analysis, Time, Capital, Interest.
Identifiers: *Price system, *Point sets, *Linear space, *Convexity, Linear function, Consumption, Decentralization, Incentives, Convex sets, Free entry, Horizon.

Recently, new applications of mathematics to the field of economics have provided the economist with additional tools for economic analysis. The essay argues that the common logical structure of received economic theories of diverse origin can be developed with the help of more fundamental mathematical tools. In Section 1 of this essay the author explains the concept of a linear space and its use in describing any commodity bundle by a point in such a space. Since a restraint on choice is then suitably described by a set of points, the author reviews a few concepts and theorems of point sets in linear spaces that are useful in economic theory and illustrate their application. The first concept to be discussed, that of summation of sets, provides a tool for translating restraints on individual choices into limitations on their aggregate effects, and for showing that profit maximization at given uniform prices can under suitable conditions be decentralized. The second concept, that of convexity of a point set, allows the author to formulate conditions with regard to technology and preferences that ensure the existence of a price system which sustains decentralized optimizing production and consumption decisions. These concepts are then used in combination for the description of competitive equilibrium and the analysis of its optimality properties for the further study of productive efficiency under constant returns to scale and its relation to the price system and for the study of allocation of resources over time. This type of analysis is useful in the water area due to the increased use of mathematical models for water planning decisions. (See also W70-00630). (Loeb-Rutgers)

THE INTERACTION OF TOOLS AND PROBLEMS IN ECONOMICS,
Yale Univ., New Haven, Conn.
Tjalling C. Koopmans.
IN Three Essays on the State of Economic Science, McGraw-Hill Book Co, Inc, New York, p 169-220, 1957. 52 p.

Descriptors: *Economics, Mathematical studies.

Identifiers: Problems, Economic dynamics, Computing techniques, Management science, Statistical inference, Economic behavior, Sample survey, Tool developments, Research.

When we set about defining a field of scientific inquiry, such as economics, we identify a class of phenomena to be studied. For instance, in defining descriptive economics, we may say that we study the satisfaction of wants in human society. The particular formulation of such a definition is of no great importance and other forms may be more accurate or more informative. However, we observe that the definition specifies only the problems to be studied and not the tools of observation and analysis to be applied to these problems. In principle, tools have a servants status. The best choice of tools depends on the problem area selected and on the extent to which at least partial answers have been found. The tools that should be developed for future use depend on the precise nature of the problems that seem most likely to be demanding or promising further answer. If we look with a historian's interest at the development of a science, however, we find that tools also have a life of their own. They may even come to dominate an entire period or school of thought. The availability of certain tools may lead to an awareness of problems that can be solved with their help. Tools may thus become a guide to research. In any case changes in tools and changes in emphasis on various problems go together and interact. The essay examines four recent and current tool developments and seeks to perceive some of their implications for future research. The essay is relevant to the water area in respect to the development of tools such as mathematical and statistical techniques which are currently applied to the water area in an extensive manner. (See also W70-00630). (Loeb-Rutgers)

THE CONDITIONS FOR ECONOMIC GROWTH OF THE ARID LANDS,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
M. M. Kelso.
International Conference on Arid Lands in a Changing World, June 3-13, 1969, University of Arizona, Tucson, 1969. 22 p, 3 ref.

Descriptors: *Arid lands, *Natural resources, *Economics, *Agriculture, Mineral industries, Irrigation, Elasticity of demand, Mexico, Income, Population.
Identifiers: *Economic growth, *Per capita income, *Western U.S., Australia, South Africa, Amenity resources.

The author discusses opportunities for and constraints upon self-generating economic growth in arid regions of the world. Economic growth is defined in per capita income terms. Arid and semiarid regions of the world are all hinterlands to some industrial market-economy heartland and they are all largely dependent on natural resource-based primary production for their economic growth. Those areas will be favored which (1) contain a diversity of natural resources permitting advantage of a wider range of demands; (2) are close linearly, economically, and culturally to their industrial heartlands; (3) are free of strong barriers imposed by nation-state boundaries; and (4) are not burdened already with over-population or cultures poorly adapted to functioning smoothly in larger market economics. Most of the arid areas of the world face severe restraints to attainment of internal self-generating growth. Agriculture in these arid regions requires irrigation to produce those crops which are good growth stimulators. Frequently a water supply is lacking or will require large capital to develop or may already be 'locked up' by the indigenous population. Amenity resources emerge rather late as bases for economic growth owing to their cultural distance at early stages of development. (Crouse-Arizona)

STRUCTURE OF THE ARIZONA ECONOMY: OUTPUT INTERRELATIONSHIPS AND THEIR EFFECTS ON WATER AND LABOR REQUIREMENTS. PART I. THE INPUT-OUTPUT MODEL AND ITS INTERPRETATION,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
Anilkumar G. Tijoriwala, William E. Martin, and Leonard G. Bower.
Arizona Agricultural Experiment Station, Tucson, Technical Bulletin 180, Nov 1968. 33 p, 18 tab.

Descriptors: *Input-output analysis, *Economics, *Arizona, *Water requirements, *Water values, Industrial water, Economic prediction, Arid lands, Agriculture, Model studies, Labor supply.

The 'Leontief' system of input-output accounts is used to develop quantitative estimated of interrelationships of the complete economy of Arizona. Part I of this report describes the model in some detail. With supplementary data, output requirements from each industry can be translated into requirements for primary resource needs such as water - an important consideration in arid Arizona. Primary resources are basic factors of production, the total quantity of which may not be increased in response to additional requirements. Water intake coefficients are developed which represent the quantity of water required by each sector to produce $1,000 of output. An increase in feed grains and food production would take 42 acre feet of additional water input per $1,000 of output, compared with .21 acre feet required per $1,000 increase in output in the utilities sector. Value added per acre foot of water intake is $13.52 for the food and feed grains sector, but is $140,331.18 for the fabricated metals and machinery sector. These and other coefficients developed in the analysis are discussed in terms of their implications for economic growth in Arizona. (Crouse-Arizona)
W70-00697

THE WATER RESOURCES OF CHILE; AN ECONOMIC METHOD FOR ANALYZING A KEY RESOURCE IN A NATION'S DEVELOPMENT,
Resources for the Future, Inc., Washington, D.C.
Nathaniel Wollman.
Baltimore, Johns Hopkin's Press, 1968. 279 p, 4 fig, 1 map, 102 tabs, 31 ref, 3 append.

Descriptors: *Water resources development, *Future planning (Projected), *Water utilization, Competing users, Crop production, Mineral industry, Reasonable use, Water conservation, Distribution patterns, Irrigation practices, Water demand, Water management (Applied), Water quality, Water pollution, Administrative agencies, Appraisals, Decision making, Arid lands, Estimating, Geographical regions, Desalination, Long-term planning, Regional analysis, Water law, Economic feasibility, Human population.
Identifiers: *Chile.

The main objective of this book was to workout a methodology for careful planning and programming of a national water development program, within the framework of general economic and social planning, adaptable to any country. Subjects treated are geography, the projection model, a general survey of agriculture, use of water for irrigation, experience with government irrigation projects, projection of agricultural water use, mining and electric power, manufacturing uses of water, municipal water use, waste treatment and dilution, total water requirements, the cost of water, the effect of water shortage, the question of water quality, and effects of variations on the system. Each subject or problem is treated as a part of the entire social economic system and the expected results of certain programs are predicted. Lack of adequate data for rational decision making is discussed and areas of greatest need are indicated. (Sherbrooke-Arizona)

WATER RESOURCES PLANNING IN AUSTRALIA,
Adelaide Univ. (Australia). Faculty of Architecture and Town Planning.
F. D. Wallace Van Zyl.
Tijdschrift voor Economische en Sociale Geographie Vol 58, No 6, p 306-315, Nov-Dec 1967. 5 fig, 11 ref.

Descriptors: *Multi-purpose projects, *Regional analysis, Recreation, Precipitation (Atmospheric), Erosion control, Irrigation systems, Resource development.
Identifiers: *Australia, *Snowy mountains, Ord River, Regional planning.

Most of Australia's great inland area is arid, and even in the far north where rainfall is relatively high it is concentrated during the monsoon season, with water in short supply during much of the remaining year. For the most part the area in which precipitation exceeds evaporation is limited to a narrow belt of 50-150 miles in width along the coasts. The struggle between urban-industrial and agricultural users has begun. Much of the continent's vast soil and mineral resources remains undeveloped for the lack of water. Water resource development in Australia has been characterized by a lack of integration. Power and water development has been correlated with local agricultural planning as exemplified by the Snowy Mountains Scheme, but seldom with mineral, industrial or national agricultural development. Future water projects should be undertaken only in light of overall national resource planning including adequate economic analysis. In some cases planning should be on an international regional basis since much of northern Australia lies closer to Indonesia and Southeast Asia than to the heavily developed areas of southern Australia. (Crouse-Arizona)

OPTIMUM INESTMENT IN STRUCTURAL FLOOD CONTROL,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
William Whipple, Jr.
Jour Hydr Div, Am Soc Civ Engrs, Paper 6238, HY 6, Vol 94, p 1507-1515, Nov 1968.

Descriptors: *Flood control, *Flood plain zoning, *Optimization, Cost benefit analysis, Economic evaluation, Floods.
Identifiers: *Economic site advantage, *Project-induced economic growth, Project induced damages.

National flood damages have been increasing, despite extensive construction programs, due largely to economic encroachments on the flood plain. This situation calls for a reconsideration of flood control economics. Much of this encroachment occurs as a result of the areas being protected by flood control projects, which results in project-induced economic growth. The flood damages resulting to project-induced growth are negative benefits; but there is also an economic site advantage due to the development in these particular locations. When analysis takes these aspects into consideration a higher degree of protection will be found marginally justified; and partial protection will be shown to be much less advantageous. Basin-wide reservoir systems inherently involve extensive partial flood protection, due partly to the extension of effects downstream and partly to the continual economic development in flood plain areas lower than those to which adequate protection is afforded. Therefore, some way must be found to control project-induced growth downstream, as an adjunct of reservoir systems. This could be done by general reservation of floodways downstream of flood control reservoirs.

URBAN DESIGN STUDY OF THE HONOLULU WATERFRONT.

Oahu Development Conference, Oct 1968. 40 p, 39 fig, 4 photo, 18 ref.

Descriptors: *Urban renewal, Design criteria, Recreation demand, Recreation facilities, Aesthetics, Harbors, Inland waterways, Tourism, Hawaii.
Identifiers: Honolulu, Oahu.

The purpose of the study is to analyze conflicting demands on the Honolulu waterfront. A seven-mile section of the waterfront was selected for study. Proposals for development include: (1) trebling the present capacity of the Honolulu International Airport by 1985; (2) enlarging the water sports facilities in Keehi Lagoon; (3) developing and enlarging Sand Island as an industrial park for port-related industry, marine repair facilities, an airport fuel storage depot, and a sewage plant; (4) developing an Inter-Island Ferry Terminal related to the downtown transportation network; (5) linking Chinatown, Downtown and the Civic Center with the waterfront; (6) extending Fort Armstrong peninsula to include a Food Distribution Center, University of Hawaii Oceanographic Center and a new location for the U.S. Bureau of Commercial Fisheries; (7) developing Kewalo Basin to accommodate more shops and restaurants to meet growing demands related to tourism; (8) developing Magic Island to include additional public facilities; (9) rebuilding Waikiki beaches to provide new public facilities and accessways; (10) planning for coping with traffic congestion in Waikiki; and (11) hotel and apartment development close to Diamond Head. The three fundamental development policies of this study are aimed at developing Waikiki primarily for the visitor and casual resident. These policies are: (1) adequate transportation facilities to and from the airport and pleasant pedestrian access-ways to the beaches and other recreational facilities; (2) preserving the aesthetic value of Diamond Head and the Ala Wai; and (3) reducing unrelated automobile traffic. (Starr-Chicago)

COORDINATION OF URBAN PLANNING AND FLOOD PLAIN DEVELOPMENT,
Eugene O. Johnson.
IN Flood Plain Management, Iowa's Experience, ed Merwin D. Dougal (Iowa State University Press, 1969), p 103-111. 1 fig, 11 ref.

Descriptors: *Water management (Applied), *Flood control, *City planning, Land use, Flood plain zoning, Non-structural alternatives.
Identifiers: *Duck Creek, Davenport, Iowa, Flood plain management.

This article discusses efforts to combine management and controlled flood plain use in a 'middle of the road' approach to solving problems of flood plain occupancy in Davenport, Iowa. A brief history of flood control measures and plans since 1918 is given. By 1965 two very different approaches were proposed as solutions to the problem. The Corps of Engineers proposed leaving the entire 100 year flood area in open space use; the second approach was creation of a pilot channel and improved floodway. Both proposals had drawbacks and met with public opposition. A compromise program was finally evolved through coordination of the Corps of Engineers, the INRC, and the City of Davenport. It called for confining a design flood within the area that would normally be inundated by a flood of 10 year frequency. Land fill elevations were established that would place any future structures above the control elevations. Regulations were to be enforced through flood plain zoning of two types: (1) a channel district which would be confined to open space uses, and (2) a flood plain district in which construction would be allowed in accordance with zoning and elevations ordinances. Administration, enforcement, and control would rest with the local governing body. This program, although it was legally sound and seemed to meet all requirements of the various agencies involved, failed to gain public acceptance. In conclusion, without coordination, development of adequate solutions for flood plain management and flood control is difficult to achieve. Also, it is necessary to familiarize political representatives in city government with the overall program in order to gain public support. (Marriott-Chicago)
W70-00751

THE INTERACTION OF URBAN REDEVELOPMENT AND FLOOD PLAIN MANAGEMENT IN WATERLOO, IOWA,
John R. Sheaffer.
IN Flood Plain Management, Iowa's Experience, ed by Merwin D. Dougal (Iowa State University Press, 1969), p 123-135. 3 fig, 11 ref.

Descriptors: *Water management, *Flood control, *Multiple-purpose projects, Urban renewal, Land reclamation, Recreation, Area Redevelopment, Economic efficiency, Benefits.
Identifiers: *Waterloo, Iowa, *Flood plain management.

The interrelation of flood problems and other urban deficiencies is illustrated by an analysis of Waterloo, Iowa; a city of 75,000 that is bisected by the Cedar River. Associated with Waterloo's flood problems were acute land and water resource management problems which were of great economic importance to the area. A traditional single-purpose construction solution was proposed by the Corps of Engineers but was found to be unacceptable because although it would control the 100-year flood water it would do nothing to mitigate the other problems also present. Instead, the community sought a complex metropolitan-area water management strategy. A decision was made to join two major but separate national domestic efforts--flood control and urban renewal--into an integrated urban program. A flood control project was devised that would emphasize preservation and reclamation of the esthetic and environmental qualities of the Cedar River, would eradicate slums and blight, create new public and private uses of land, and restore the diagonal belt of deterioration which bisected Waterloo. The complex multipupose plan called for modifications of the Corps plan which are discussed in some detail. Benefits of the modified program include lowering of costs, improved environmental quality, stimulation of new economic growth, and a shorter time to complete the project. (Marriott-Chicago)
W70-00752

THE ILLINOIS STATE PLANNING PROGRAM,
Illinois State Board of Economic Development.
Guy Kelnhofer.
Water Resources Planning in Illinois, Illinois Board of Economic Development, 1964. p 39.

Descriptors: *Water resources planning, *Water resources development, Coordination, Future planning.

The statewide planning program of Illinois' official planning agency, the Board of Economic Development, is described. Beginning with studies of the population and economic prospects of the State and its regions, an inventory and analysis of the State's public works expenditures, and a preparation of a plan for the development and management of the State's water resources, future work programs will be undertaken. These will include statewide planning for outdoor recreation, transportation, land use, natural resources, and capital budgeting. The objectives of the board's statewide planning program are: (1) provision of an advance warning of impending changes in the economy of the State and in the distribution of its population; (2) preparation of plans which can serve as a basis for coordinating public and private development activities in an area; (3) definition of the State's interests in certain important areas; (4) maximization of returns on State investments in public facilities; and (5) organization of a system of data collection. Through development of a planning program which meets these objectives, the Board can provide State officials with the information necessary to implement courses of action to meet expected future problems. (Starr-Chicago)
W70-00753

ILLINOIS PLANNING STUDIES AND COORDINATING ACTIVITIES,
Illinois State Board of Economic Development.
Gene H. Graves.
Water Resources Planning in Illinois, Illinois Board of Economic Development, 1964. p 29-30.

Descriptors: *Water resources planning, *Water resources development, Coordination, Future planning, Research and development, Water allocation, Population, Economic prediction.

The record of Illinois state agencies in carrying out broad water resources responsibilities is discussed. The role of the Board of Economic Development as a coordinating and planning agency supplementing separate agency programs is described. Specific water resources functions were assigned to the board; some derived from groups which had been abolished and others were added in order to expand the State's role in water resources. The board constitutes a formal organization for coordinating efforts and for facilitating cooperation between agencies. Another important function of the board is to participate in and review federal programs or projects. Planning is seen as a critical aspect of the board's functions. The placing of this function with the board facilitates solving the effects of population growth and of increasing industrial water use. A series of planning studies were undertaken by the board to describe the nature and distribution of water in Illinois and to describe water uses. These studies are aimed at providing a dependable adequate supply for all users. Discussed in these studies are all the levels of activity, federal, state, and local, public and private which are involved in water development and management and in providing water services. (Starr-Chicago)

RESEARCH PERSPECTIVE FOR SOCIOLOGICAL PROBLEMS INVOLVING WATER RESOURCES,
Utah State Univ., Logan.
Melvin L. Cotner.
IN Proceedings of the Workshop for Sociological Aspects of Water Resources Research, Held at Utah State University, Logan, Utah, April 18-19, 1968, Report No 1, Social Science Institute Series, p 47-62. 10 ref.

Descriptors: *Research and development, *Social values, Water resources development, Economic impact, Institutions, History, Planning, Political aspects, Political constraints, Institutional constraints, Legal aspects, Financing, Cost sharing.
Identifiers: *Sociology, Economic growth, Information diffusion.

The paper focuses on problems that are economic in nature but require sociological research to be dealt with adequatly. The first section discusses the relationship of resources to economic growth. Science and technology can increase the quantity and quality of resources, and so affect economic growth. To deal with the dynamic development and use of water resources created by science, we must provide an appropriate institutional system which incorporated a complete overview of resource use, trends, supplies, development possibilities, appraisals of demand, etc. The history of water resources planning is summarized. The second section discusses cultural and political influences on water resources and economic growth. Traditional and agrarian values within the social structure; sectional interests; and a complex set of laws, administrative rules, and political gerrymandering retard economic growth and present questions for the social scientist. Section 3 discusses five research topics: (1) cultural barriers; (2) non-economic mo-

tives; (3) organizational arrangements; (4) financial arrangements; and (5) legal arrangements. The section recommends indepth studies of the ordering of values that influence individuals to adopt watershed practices. It recommends research on: the information-diffusion process; alternate planning organizations; the most effective cost-sharing procedures; and term lease arrangements between a State and a private user. Related questions are suggested. (Gossen-Chicago)

WATER FOR PEOPLE,
Utah State Univ., Logan.
Albert H. Stevenson.
IN Proceedings of the Workshop for Sociological Aspects of Water Resources Research, Held at Utah State University, Logan, Utah, April 18-19, 1968, Report No 1, Social Institute Series, p 89-94.

Descriptors: *Water shortage, *Public health, Water resources development, Water quality control, Political aspects.

The report discusses two topics: (1) community water supply, and (2) the relationship of health to water resource development and water quality control. According to the report, 'Historically, urban water supply needs have had profound effects upon the political system in major cities. The 'have' community may force the annexation of adjacent 'have not' communities. Limited foresight in planning and development of community water systems has curtailed the growth potential of major cities even in the 1960's.' Two solutions for current urban water shortage problems are: a reduction in system leakage, and a reduction in per capita water consumption. The latter is discussed from a viewpoint of water as a commodity and implies a change in traditional water use patterns from non-metered residential use to a metered system. Either solution must be communicated to the public in non-technical terms. The relationship between health and water quality control is discussed in terms of swimming. Health officials should outline predictable results from swimming in waters of different qualities using, for example, enterococcus as measurement indicator. Mosquito problems should be considered in development of the hot irrigated western valley regions. (Gossen-Chicago)

POTENTIAL SOCIOLOGICAL RESEARCH IN WATER RESOURCES DEVELOPMENT,
James D. Sears.
IN Proceedings of the Workshop for Sociological Aspects of Water Resources Research, Held at Utah State University, Logan, Utah, April 18-19, 1968, Report No 1, Social Science Institute Series, p 95-103.

Descriptors: *Planning, Economic efficiency, Preservation, Attitudes.
Identifiers: *Army Corps of Engineers, Regional development, Susquehanna River Basin, Information diffusion.

The Army Corps of Engineers is undergoing a change in emphasis from planning with a single objective--economic efficiency--to using systematic analysis of alternative objectives and programs. The Corps has initiated a modified planning process with three objectives: regional economic development and environmental quality, as well as economic efficiency. Planning for the Susquehanna Basin will consider these objectives in separate plans. The Economic Efficiency Plan would satisfy needs that are economically justified by national benefits. The plan may include large main reservoirs but preclude preservation of scenery. Mine drainage control would probably be minimum. The Regional Development Plan would satisfy needs that are economically justified by a mix of uses, regional, and national benefits. Such a plan may include a greater degree of resource development and a recreation complex to stimulate regional economic development. The Environmental Quality Plan would preserve scenic rivers and other high value environmental quality features. More costly development alternatives and mine drainage control would be included. The needs to discover public attitudes and to disseminate information are discussed. The operation of the Graduate Fellowship Program, which employs selected graduate students from all fields to carry out research and analysis, is described. (Gossen-Chicago)

SOCIAL PROBLEMS NEEDING SOLUTIONS, STATE AGENCIES,
Idaho Univ., Moscow. Water Resources Research Inst.
Calvin C. Warnick.
IN Proceedings of the Workshop for Sociological Aspects of Water Resources Research, Held at Utah State University, Logan, Utah, April 18-19, 1968, Report No 1, Social Science Institute Series, p 115-118. 1 ref.

Descriptors: *Attitudes, Planning, Idaho, Scenery, Social values.
Identifiers: *Interest groups, Sociology, Water replacements.

The central problem of planning is that of establishing objectives. Conflicting social interests present a major difficulty in defining goals. Specific conflicting interests in Idaho include: whether scenic rivers should be preserved in a national wild rivers system, and whether a system of water replacements should be adopted. Changing social interests must also be considered in the planning process. In Idaho, reclamationists presently form a powerful interest group, and concern for clean waters is increasing. Reasons for changing interests require study. The lecture concludes that research in social science should involve studies on: (1) goals of water resource planning that will enhance the welfare of people locally, by states, and nationally; (2) the establishment of population dispersion to areas where water is readily available; (3) the quality improvement of waters and acceptance of necessary action programs; (4) social values in preserving certain scenic streams; (5) attitudes of special interest groups and their influence on possible water resource developments; (6) social attitude problems in connection with lands around water developments, along lake fronts, and along stream banks; and (7) ways of changing attitudes toward water exchanges and special replacement schemes. A FRESH APPROACH TO WATER LAW,
Abel Wolman.
Am Water Work Assn J, Vol 50, No 10, p 1279-1284, Oct 1958. 6 p, 3 ref.

Descriptors: *Water policy, *Water resources development, *Competing uses, *Water demand, Water allocation (Policy), Administration, Water utilization, Water requirements, Water resources, Water shortage, Legislation, Budgeting, Administrative agencies.

The recent concern over water policy and water use has resulted from several factors. First, population growth and the development of new devices requiring water have increased water use. Second, cheaper sources of water have already been preempted and development of new sources has been more costly. Third, this increased demand for water in recent years has occurred concurrently with a dry cycle of weather. The factors have caused a resurgence of competitive demands for water. These demands should be met with a rational state water program, not hastily conceived legislation. The essential elements of a sound state water program are: (1) an estimation of the magnitude of available water resources; (2) a continuing accumulation of information on the availability of the resource in specific areas; (3) an accounting process for the quality of these resources; (4) an estimate of the expected use; (5) a program of developing water resources; and (6) administrative agencies with sufficient budgets to resolve a development program. These administrative agencies should be permanent, flexible, and actively responsive to changing trends. (Gabrielson-Florida)

THE UNITED NATIONS AND MARINE RESOURCES,
David S. Browning.
Wm and Mary L Rev, Vol 10, No 3, p 690-704, Spring 1969. 15 p, 35 ref.

Descriptors: *International law, *International Hydrological Decade, *International waters, *United Nations, Federal government, Standards, Conferences, International commissions, Continental shelf, Marine geology, Oceans, Commercial fishing, Data collections, Treaties, Jurisdiction, Ownership of beds, Political aspects, Marine fisheries, Exploitation, Exploration, Natural resources, Legal aspects, Resource development.
Identifiers: *Territorial waters, Ocean floor.

Because of growing international interest in the exploitation of marine resources, the United Nations has become involved in discussions concerning the nature of these resources and the proper legal environment for their exploitation. By international convention the continental shelf, wherein a coastal nation may exercise its jurisdiction, is defined as extending to submarine areas under two hundred meters or less of water, or as far beyond that point as resources can be exploited. The uncertainty of this definition, as well as national claims to exclusive fishing zones up to two hundred miles, reveals a need for new international standards. With technology rapidly increasing, many of the smaller members of the United Nations fear that the oceans will become subject to a colonial-type grab by the powerful nations, resulting in an inequitable division of the sea's resources. The first manifestation of this concern was when Malta proposed a declaration and treaty concerning the reservation exclusively for peaceful purposes of the ocean floor and the use of its resources in the interests of mankind. The outgrowth of this and other recent proposals and discussions is that the U.N. has declared an International Decade of Ocean Exploration to begin in 1970. (Schram-Florida)

INTERSTATE COOPERATION IN RIVER BASIN DEVELOPMENT,
Lynton K. Caldwell.
Iowa L Rev, Vol 32, No 2, p 232-243, Jan 1947. 12 p, 27 ref.

Descriptors: *Interstate, *Federal jurisdiction, *State jurisdiction, *Water resources development, River basin development, History, Legislation, Conservation, Interstate commissions, Interstate compacts, Interstate rivers, Navigable waters, Judicial decisions, Navigation, Inland water ways, Pollution abatement, Irrigation, Industrial water, Administrative decisions, Community development, Federal-state water rights conflicts, Social needs, Political aspects.
Identifiers: *Interstate cooperation.

Although jurisdiction over the navigable waters of the nation has been assumed by the federal government under the doctrine of implied powers, the extent of this federal authority remains indeterminate. The states have always exercised certain powers over rivers and lakes within their boundaries and Congress, through approval of interstate compacts, has recognized this interest. After early efforts at interstate cooperation, the federal government began in 1879 to exercise and expand its jurisdiction over navigable waters. Growing population and the expansion of machine technology intensified the pressure on all national resources between 1910 and 1940. Governmental action was needed to improve navigation, to protect water for human consumption, to make water available for

industry, to irrigate land, to abate pollution, to drain land, to prevent floods, to conserve fisheries, and to provide for recreational uses. The federal government, able to cut across state lines, possessing greater fiscal and technical facilities, and unhampered by constitutional prohibitions, was able to move more rapidly than the states. More recently, however, states are demonstrating that the cooperative solution of regional problems can be successfully undertaken. Thus, new forms of inter-governmental organization, involving interstate-federal cooperation, are emerging to meet current needs. (Schram-Florida)

SOME OBSERVATIONS ON ECONOMIC EVALUATION STUDIES,
Oregon State Univ., Corvallis.
Emory Castle.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 68-71, Mar 1964.

Descriptors: *Benefit-cost ratio, Competing uses, Public benefits, Monetary benefits, Input-output analysis.

Non-government economists' writings have generally reached conclusions that would lead to a more conservative public investment policy in water resource development. Senate Document No. 97 is seen as favoring public as opposed to private investment; natural resource investment over other kinds of public investment; and long-term over short-term public investment. Specific provisions of the document are reviewed. Secondary benefits are usually seen as not being relevant to decision-making in the private sector of the economy so long as primary and secondary firms are independent units. In the Senate document, however, secondary benefits are defined precisely and are provided for by inclusion in the benefit-cost ratio. The author contends that secondary benefits will increase the benefit-cost ratio, while, at the same time, there are no existing means of measuring these secondary benefits or predicting their lasting effects. The pressure for public investment in water resources is such that the agencies have no alternative other than to include in their measurements of many questionable items. Economic evaluation studies must be undertaken with inadequate and imperfect tools and procedures. Suggestions are given to improve existing technique: (1) benefit-cost ratio should be recognized as only one criterion of the worth of a project; (2) benefit-cost analysis should be used to measure economic efficiency considerations primarily and not too many other objectives of public investment; (3) academic economists should be aware of the problems of economists in government agencies and yet avoid being trapped by the procedures and rules of these agencies. (Starr-Chicago)

SOME PROBLEMS IN EVALUATION OF WATER RESOURCES,
Washington Univ., Seattle.
James A. Crutchfield.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, p 72-74, Mar 1964.

Descriptors: Technology, Market value, Discount rate, Tangible benefits, Intangible costs, Estimated benefits.

While benefit-cost frameworks have produced significant improvement in the development and application of criteria for public investment in water resources, it is not a perfect instrument. Three areas for improvement are cited: (1) improvement of existing valuation techniques; (2) extension of these techniques to intangibles; and (3) a careful assessment of some basic assumptions underlying current measures of social benefits and social costs. Some problems of evaluation are (1) the discount rate is seen as being too low and, therefore, public investment may be slanted too much in the direction of long-lived, large scale projects; (2) the impact of technological change is another complication of the long-term investment. Short-term projects could more easily embody technological change; (3) the soundness of present methods of measuring benefits is questionable; (4) little empirical evidence that on redistribution effects of major investment programs in the water resources field; (5) present assignment of responsibility for federal water programs does not encourage consideration of all alternatives. Two general policy recommendations are given: (1) need for an independent audit of planning activities related to water; and (2) more effective use of market prices should be made to facilitate valuation procedures and administrative procedures. CREDIT AND COLLECTION POLICIES AT EUGENE, OREGON,
Eugene Water and Electric Board, Oreg.
J. E. Brown.
Journal of American Water Works Association Vol 61, No 5, p 234-236, May 1969. 3 p, 1 fig.

Descriptors: *Credit, *Economics, *Water utilities, Instrumentation, Computers, Public health.
Identifiers: *Collection, *Bad debt losses, Accounts receivable, Credit history, Service suspension, Collection agencies, Unemployment, Public welfare.

This article surveys the credit and collection policies of water utilities of the Water and Electric Board of Eugene, Oregon. This is of vital interest since credit is routinely given in the utility business. Economically, this industry works for 'nothing' by selling services at cost; poor credit and collection policies in this industry can easily result in working for less than nothing by selling the product and failing to collect for it. The theory in Eugene attempts to rectify this situation by reducing bad debt losses to the lowest possible level and speed the collection of receivables to free capital for production in other parts of the business. To achieve this, Eugene maintains a complete credit history of all customers, requires deposits, and suspends service for non-payment. These measures have been found necessary due to prosperity which has given false promise of ability to pay, increasing bankruptcies, family migration, unemployment programs, health plans, social security and welfare programs. CONTROLLING ACCIDENT COMPENSATION COSTS,
San Diego, Calif.
J. F. Gleason.
Journal of American Water Works Association Vol 61, No 5, p 231-233, May 1969. 3 p.

Descriptors: *Accidents, *Costs, *Water works, *Claims, *Legal aspects, *Financing, *Insurance, Compensation, Management, Economics.
Identifiers: *Industrial safety, *Accident prevention, Disability awards, Loss control, Liability, Apportionment.

This article deals with industrial safety, particularly in the area of water works. For this reason, it is of interest to these working in the water resource field, especially the researcher concerned with the economics of safety. Industrial safety reflects the effectiveness of management control over accidents and accident costs, particularly evidenced since the establishment of workmen's compensation laws. Of great concern to water works management is the severity rates and costs of accidents, since these seem to rise, although overall accident rates and costs have declined. Positive loss control actions, as well as increased accident prevention measures, are greatly needed, especially in water works, to control the severity factor. Claims control, legislative persuasion, and adequate financial control are necessary to achieve these ends. (Murphy-Rutgers)

TAXATION AND THE DISPOSITION OF DEPRECIABLE ASSETS,
State Univ. of New York, Buffalo.
Ronald J. Huefner.
The Engineering Economist, Vol 14, No 3, p 141-150, Spring 1969. 10 p, 1 ref.

Descriptors: *Decision making, *Investment, *Taxes, Depreciation Risks.
Identifiers: *Depreciable assets, Internal Revenue Code, Depreciation deductions, Capital gains, Additional depreciation, Income tax, Depreciation method, Sale, Exchange.

The Internal Revenue Code presently provides, under Section 1245 and 1250, for the 'recapture' of depreciation deductions, by taxing certain gains from the sale of depreciable assets at ordinary income rates. Section 1245 covers depreciable assets with the exception of buildings and their structural components. Upon disposition of Section 1245 assets, the gain is taxable at ordinary rates, to the extent of the amount of depreciation claimed since January 1, 1962 and any remainder at capital-gains rates. Section 1250 covers depreciable real property and provides that, upon the early retirement of such assets, the gain will be taxed as ordinary income, to the extent of a portion of any 'additional depreciation' deductions after January 1, 1963. The portion of this additional depreciation which is subject to ordinary income-tax rates is 100 percent less one percentage point for each full month the asset is held over twenty months. The author considers, first, the effect this tax provision should have upon decision-making with respect to several aspects of depreciable assets and secondly, the effect upon investment decisions in general. As such, this should be applicable to decision-making in the water area, in that methods and timing of the replacement of water facilities would be influenced by the present tax policies. (Loeb-Rutgers)

PRODUCTION COST FACTOR IN RATE-MAKING,
Florida Univ., Gainesville, and Northwestern Univ., Evanston, Ill.
J. P. Heaney, and R. S. Gemmell.
Journal of the American Water Works Association, Vol 61, No 2, p 102-106, Feb 1969. 5 p, 2 tab, 10 ref.

Descriptors: *Municipal water supply, *Costs, *Water rates, *Marginal costs, *Variable costs, Water works, Wells, Aeration, Sedimentation, Economics, Ground water, Economies of scale, Electric power.
Identifiers: *Incremental costs, *Water rate differentials, Plant capacity, Institutional constraints, Debt servicing, Replacement costs.

This article analyzes the production cost component of water utility costs and investigates its role in establishing rates. (The cost of producing water is increasingly important for many communities because of growing scarcity and pollution of existing water supply resources.) Short-run and long-run production costs were examined for the Mount Prospect, Illinois water works. The short-run analysis was to define the relationships between variable costs and actual plant output. Variable costs were found relatively constant for this utility. Where significant production cost differentials exist, the utility has a firm basis to establish water rate differentials. The analysis of production costs as the utility changed its scale of plant indicated that current rate-making practices may be inequitable to certain groups of water users if the expansion takes place where long-run incremental costs of production are increasing. Incremental production cost analysis was found useful in providing an analytical approach to the problem of incorporating the production cost component of water utility expansion into the overall assessment levied on new users. (Murphy-Rutgers)

COST OF CAPITAL TO THE SMALL FIRM,
California Univ., Los Angeles.
Eugene V. Brigham, and Keith V. Smith.
The Engineering Economist, Vol 13, No 1, p 1-26, Fall 1967. 26 p, 6 fig, 1 tab, 1 append.

Descriptors: *Costs, *Capital, Taxes, Debt, Marginal costs, Investment, Risks, Growth rates.
Identifiers: *Small firms, *Cost of capital, *Firm size, Investment theory, Marginal cost of capital, Investment decision, Weighted average cost of capital.

The investment theory of the firm contends that management should adjust the level of capital expenditures to the point where the marginal rate of return for investment projects is equal to the marginal cost of capital. While there has been considerable progress in determining appropriate methods for evaluating and ranking potential investments, little has been accomplished toward developing useful measures of the cost of capital to a typical firm. The cost of capital is typically treated as a known parameter when it is used as a discounting factor or as the appropriate cut-off rate. This paper is concerned with the question of how a firm's size affects its cost of capital and, thus, its capital investment. In particular, its purpose is (1) to postulate the marginal cost of capital schedule as a function of firm size, (2) to justify the postulated schedule on the basis of theoretical arguments and existing empirical studies, and (3) to suggest the implication of such a cost schedule to investment decisions made by managers of small firms. As such, this may be useful to the water planner involved with projects where an investment decision must be made as to water treatment facilities and reservoirs that would require capital financing. (Loeb-Rutgers)

ASSET PRICES IN ECONOMIC ANALYSIS,
California Univ., Berkeley.
Samuel B. Chase.
Berkeley, University of California Press, 1963. 153 p.

Descriptors: *Prices, *Economic analysis, Demand, Risks, Marginal cost, Investment, Government, Taxes, Debt, Elasticity of demand.
Identifiers: *Assets, Liquidity, Wealth, Consumption, Flow supplies, Capital markets.

This study is designed to clarify and emphasize the role of assets in economic analysis. It focuses on the asset pricing process and its interrelations with other economic phenomena and it is argued that these interrelations are crucial in the determination of general equilibrium conditions. The first part of the book deals with the nature of the choice people make when they decide between holding assets and consuming and its implications for the determination of asset prices. The second section of the book is concerned with exploring problems such as an alternative treatment of the connection between present and expected prices, trading costs and liquidity and the workings of the asset market. The last two chapters are of particular interest to the water researcher since they deal with the effect of government debt operations and the implications of government financial policies on demand. (Murphy-Rutgers)

THE RELATIONSHIP BETWEEN FLOOD LOSSES AND FLOOD-CONTROL BENEFITS,
Chicago Univ., Ill.
Edward F. Renshaw.
Pages on Flood Problems, Chicago, Chicago University Press, p 21-45, 1961. 1 fig. Edited by Gilbert White.

Descriptors: *Flood damages, *Flood protection, *Flood control, *Benefits, *Costs, *Economics, Flood plains, Optimization, Flooding, Investment, Measurement, Data collection, Taxes land use, Resource allocation, Government supports, River basins, Insurance.
Identifiers: *Flood losses, *Flood loss estimation, *Subsidies, Social costs, Secondary losses.

In the first part of this paper the relationship between flood losses and flood control benefits is discussed within a context of (1) optimal regional development, (2) a case involving social costs, and (3) situations leading to a general over-development of flood-plain land. The author feels that there exists no theoretical justification for assuming a one-to-one correspondence between flood losses and benefits accruing to the community as a whole from flood prevention. In the second part, attention is focused on the measurement of flood losses. It is suggested that a number of traditional categories of losses can be ignored and that physical loss estimates can be improved with greater use of synthetic models. A six point program for improving loss estimates is presented. (Murphy-Rutgers)

COST ALLOCATION IN RELATION TO WESTERN WATER POLICIES,
California Univ., Berkeley.
S. V. Ciracy-Wantrup.
IN Economics and Public Policy in Water Resource Development, Ames, Iowa, Iowa University Press, p 189-208, 1965. 20 p, 14 ref. Edited by S. C. Smith, and E. N. Castle.

Descriptors: *Cost allocation, *Joint costs, *Water resource development, Economic feasibility, Cost repayment, Rates, Multiple-purpose projects, Government, Costs, Benefits, Prices, Government supports, Taxes, Industrial water, Municipal water, Irrigation, Public utilities, Water policy, Construction.
Identifiers: *Yardstick, *Form of contract, Joint product.

This article is concerned with the problem of cost-allocation in the sense of apportioning joint costs of multiple-purpose projects to individual purposes. There has usually been a connection between cost allocation and several issues such as economic feasibility, repayment, rate making, and form of contract. It is to these issues that the author hopes to apply an economic analysis although he acknowledges the problems involved in connecting these issues and cost allocation. An extensive analysis is performed on each of these issues with recommendations as to possible improvements. The article concludes with an examination of the means in which economic analysis of water resources policy can be applied to the political and legal facts of life. Reclamation laws, in particular, are receptive to the principles suggested in the article. (Murphy-Rutgers)

FRONTIER TOWN PROPERTIES, INC V STATE (CONDEMNATION VALUE OF WATER USE).

58 Misc 2d 388, 296 NYS2d 90-111 (NY Ct Cl 1968).

Descriptors: *New York, *Eminent domain, *Condemnation value, *Water utilization, Judicial decisions, Land use, Land appraisal, Land development, State governments, Water rights, Dams, Energy, Powerplants, Impounded waters, Appropriation, Ponds, Rivers, Highways, Condemnation, Relative rights, Legal aspects, Water use.

Claimant brought this action to recover compensation for land appropriated by the state in an eminent domain proceeding. Claimant contended that it also owned the right to use waters from a river located on the land in order to create an amusement park. The deed from claimant's grantor reserved all water rights and riparian rights in the river. Claimant was, however, deeded an existing dam for as long as the impounded waters were not used for power purposes or the generation of electric energy. The state contended that this restriction prohibited claimant from generating energy for any commercial use or development. If such a prohibition did, in fact, exist the value of claimant's use of the appropriated land would be substantially reduced. The court discussed the effect of the language in the deed. The court held that claimant did not have a legal right to use the water for the generation of electrical energy. The court did, however, find that claimant had the right to develop the land area bounding the impounded waters in any manner suitable for the theme park or commercial or recreational purposes, and consequently claimant was entitled to compensation. SPATIAL BEHAVIOR IN RECREATIONAL BOATING,
Ohio State Univ., Columbus; Texas A and M Univ., College Station; and Wright State Univ., Fairborn, Ohio.
B. Lentnek, C. S. Van Doren, and J. R. Trail.
Journal of Leisure Research Vol 1, No 2, p 103-124, Spring 1969. 22 p, 6 fig.

Descriptors: *Recreation, *Water resources, *Boating, *Spatial distribution, Lakes, Land management, Economies, Time, Demand.
Identifiers: *Spatial behavior, *Nonmarket-priced phenomenon, *Geography of demand, *Consumer surplus, Water skiing, Sailing, Canoeing.

This article examines some spatial aspects of recreational boating in Ohio. The study evolved as a result of another study of nationwide outdoor recreation resources which ranked water as a primary recreation resource. Boating was concluded to be a popular water-based recreation activity, especially in the North Central region. The Ohio study encompassed varied watercraft uses, such as cruising, fishing, water skiing, sailing, and canoeing. These are the five distinct groupings by activity. The authors also found three spatially-oriented groups characterized by different propensities to travel; sailors having the least propensity and fishermen the greatest propensity to travel. These findings imply the existence of a definite spatial structure to the activity specializations of the fifteen surveyed lakes. Hopefully these findings can contribute to a conceptualization of an analytical system, based on empirical evidence which aids in understanding recreational behavior. This article is of special interest to water resource researchers since it deals quite specifically with the role water resources plan in recreation. (Murphy-Rutgers)

OPTIMAL WATER ALLOCATION: THE NORTH PLATTE RIVER,
North Carolina State Univ., Raleigh; and Chase Manhattan Bank, New York.
G. S. Tolley, and V. S. Hastings.
Quarterly Journal of Economics, Vol LXXIV, No 2, p 279-295, May 1960. 17 p, 3 fig, 1 tab.

Descriptors: *Water resource allocation, *Optimization, Rivers, Irrigation, Investment, Water demand, Water supply, Economic efficiency, Costs, Water rights, Canals, Leakage, Water storage, Value, Planning, Water uses.
Identifiers: *Priority system.

This study seeks to determine the optimal distribution of water, taking as given the major investments that have been made in dams, irrigation canals, and other water facilities. The first part of the paper discusses the methodology for optimally allocating water supplies and shows solutions for problem situations. The problems studied are those of allocating water between power and irrigation, taking account of delivery losses along a canal and the effects of water rights. These results are used in the second part of the paper which examines water allocation in view of the interrelations of the river system as a whole. The areas above and below Lake McConaughy on the North Platte River were treated by this analysis and important malallocations were found to be associated with the unequal effects of water rights in water short years. WATER-RESOURCES ENGINEERING,
Ray K. Linsley, and Joseph B. Franzini.
New York, McGraw-Hill Book Co, 1964. 654 p.

Descriptors: *Water resources, *Engineering, Planning, Water management, Investment, Water resources development, Groundwater, Runoff, Probability, Droughts, Water law, Reservoirs, Dams, Spillways, Gates, Outlet works, Open channels, Pressure conduits, Hydraulic machinery, Economics, Irrigation, Navigation, Water supply, Hydroelectric power, Drainage, Sewage, Disposal, Water quality control, Flood control.
Identifiers: Storage routing, Flood frequency, Flood formulas, Rainfall frequency, Engineering economy, River navigation.

With the world population doubling every four decades, the water resources of the world are becoming one of its most important assets. Water is essential for human consumption and sanitation, for the production of industrial goods, and for the production of food and fiber. Water is an important means of transport in many parts of the world and a significant factor in recreation. Even a valuable resource can be a hazard and excessive floods cause substantial damage and loss of life throughout the world. Water is unequally distributed about the earth, and its availability at any place varies with time. Finally, in his use of this resource, man pollutes much of the available fresh water and degrades it so that it is unfit for many uses. Skilled planning and management are necessary to achieve the level of efficiency in water use which will be required in the future. Investments in water-resources development are influenced by economic, social, and political considerations as well as the basic engineering facts. The first five chapters of this volume present the subject of hydrology. Chapter 6 discusses the legal aspects of water use. Chapters 7 through 12 discusses the physical works utilized in almost all types of water-resources projects. Chapter 13 reviews the important principles of engineering economy basic to water-management. Chapters 14 through 20 discuss the principal water uses in more detail and the final chapter summarizes the planning procedures for single and multipurpose projects. (Loeg-Rutgers)

LAWS OF FLORIDA GOVERNING WATER USE,
Frank E. Maloney.
Am Water Works Ass'n J, Vol 47, No 5, p 440-446, May 1955. 7 p, 21 ref.

Descriptors: *Florida, *Water allocation (Policy), *Water demand, *Reasonable use, Water supply, Water law, Irrigation water, Water control, Water shortage, Irrigation, Legal aspects, Industrial water, Water distribution (Applied), Percolation, Groundwater movement, Riparian rights, Surface-groundwater relationships, Planning, Saline water intrusion, Natural flow doctrine.

Post and potential increases in irrigational and industrial demands for water in Florida, combined with increasing problems of salt-water intrusion and domestic uses, evidence a need for a re-evaluation of Florida's water laws. Most of Florida's water law is based upon case rulings. The water use rule as to watercourses is the reasonable use rule subject to a similar right of use by all riparian owners. Thus the question is whether diversion for irrigation or industrial use would be reasonable. The two faults of this rule are its indefiniteness and its failure to provide for diversion for use on non-riparian land. The law of reasonable use has been applied to ground water following a definite channel. Percolating waters are governed by the doctrine of correlative use or the doctrine of reasonable use. None of the above standards are clearly established by case law or sufficient to give a satisfactory criteria to control water use. A possible answer is to replace the case law with a comprehensive water code. The need for water planning becomes more apparent every day and the governor's citizen committee on water resources a constructive first step. (Darragh-Florida)

POWERS AND DUTIES OF THE DIRECTOR OF THE DIVISION OF FISH AND GAME AND OF GAME WARDENS.

Ind Ann Stat secs 11-1301 thru 11-1309 (1956).

Descriptors: *Indiana, *Fish conservation, *Wildlife conservation, *Regulation, Legislation, Legal aspects, Conservation, Reproduction, Fish, Fish reproduction, Frogs, Mussels, Wildlife, Jurisdiction, Administrative agencies, Investigations.
Identifiers: *Penalties (Criminal), Game wardens.

The Director of the Division of Fish and Game of the Department of Conservation enforces the provisions of this act and all laws of the state enacted for the propagation or protection of game, fur-bearing animals, birds, frogs, mussels, or fish. Game wardens assist the Director in carrying out his duties. The Director and the game wardens may arrest any person who is violating or attempting to violate any provision of this act or any other law of the state enacted for the protection of wildlife. The Director and game wardens are authorized to search any vehicle or receptacle in which game may be carried and may enter upon any property for purposes of patrolling or investigating when they have good reason to believe they will secure evidence of the violation of a wildlife conservation law. The Director and his officers may at any time seize and take possession of wildlife illegally possessed and may also seize any devices used for the illegal taking of wildlife; persons found with such wildlife or such devices in their possession are subject to criminal penalties. (Keith-Florida)

LICENSES: NETS, SEINES, AND TRAPS.

Ind Ann Stat secs 11-1434 thru 11-1441 (1956), as amended, (Supp 1968).

Descriptors: *Indiana, *Permits, *Nets, *Fishing, Legislation, Trapping, Jurisdiction, Adjudication procedure, Fish conservation, State jurisdiction, Legal aspects
Identifiers: Penalties (Criminal).

No person may use or set any net, seine, or trap in any waters of this state other than in waters in which such device is licensed. Such nets, seines, or traps may not be lawfully removed to a distance greater than one mile from the waters in which they are licensed for use. Any court having jurisdiction over offenses involving the protection of fish may revoke the license of an offender for up to one year. Any person fishing or trapping while having his license suspended, revoked, or denied shall be guilty of a misdemeanor. (Heckerling-Florida)

PUBLIC WORKS AND CERTAIN PUBLIC AUTHORITIES.

SC Code Ann, secs 59-3, 59-5, 59-6, 59-8, 59-14, 59-15 (1962).

Descriptors: *South Carolina, *Electric power, *Land reclamation, *Navigation, Reforestation, River basin development, Administrative agencies, Condemnation, Land use, Land tenure, Rivers, Navigable rivers, Flood control, Drainage, Hydroelectric power, Projects, Tributaries, Public health, Public benefits, Costs, Cost allocation, Federal Power Act, Construction, Permits, Water utilization, Federal government, Watersheds (Basins).
Identifiers: Public Service Authority.

The Public Service Authority shall have power to develop the Cooper, Santee, and Congaree rivers as instrumentalities of commerce and navigation; to produce, distribute, and sell electric power; to reclaim and drain flooded lands; and to reforest river watersheds in this state. The Authority shall also have the concomitant powers necessary to the exercise of the above-mentioned powers. The Authority shall have the right to acquire, in any legal manner, any lands, waters, easements, franchises, engineering data or estimates prepared for development of the above-mentioned rivers or any other real or personal property necessary in carrying out any of its purposes. The powers of the Public Service Authority shall be exercised by its board of directors, except for those duties imposed by this chapter on the advisory board. The project authorized by this chapter is for the aid of intrastate, interstate, and foreign commerce and navigation and is designed to benefit the health, welfare, and material prosperity of all the people of South Carolina. The Authority may construct the Santee-Cooper hydroelectric and navigation project as outlined by the Federal Power Commission. The two lakes belonging to the state, constructed on the Cooper River, shall be known as Lake Moultrie and Lake Marion. (Carruthers-Florida)

OREGON STATE INTEREST AND VIEWPOINT IN RIVER BASIN PLANNING IN THE WILLAMETTE COMPREHENSIVE STUDY,
Oregon State Water Resources Board.
Donel J. Lane.
IN Water Resources Management for the Needs of an Expanding Society, Seminar, University of Washington, Mar 1964. p 6-10.

Descriptors: *Water resources development, State jurisdiction, Federal-state water rights conflict, Oregon, River basin planning.
Identifiers: Willamette River Basin.

The basis for Oregon's interest in water resources planning is a section of a 1909 water code which states that 'all water within the state from all sources of water supply belongs to the public'. In 1939, the legislature created the Willamette Basin Commission which operated until 1955 when a State Water Resources Board was created. The Board was directed to undertake studies of existing water resources, existing and contemplated needs and uses of water for domestic, and industrial purposes, and for pollution abatement. These changes were all given prior to Federal recognition of the merit of conducting such studies. Two serious shortcomings exist for water resource development in Oregon: (1) the State Constitution prevents the lending of the credit of the state for water resource functions; and (2) lack of an agency at the local level with broad fiscal and legal authority to conduct comprehensive planning. SC Code Ann, secs 59-5 thru 59-6 (1962).

Descriptors: *South Carolina, *Administrative agencies, *River Basin Development, *Navigation, Rivers, Flood control, Electric power, Land use, Navigable rivers, Hydroelectric power, Projects, Legislation, Water law, Water utilization, Tributaries.

The Public Service Authority shall have the right to acquire any lands, waters, riparian rights, easements, engineering data, or construction plans prepared for development of the Cooper or Santee rivers. Before such acquisition of any of the above, belonging to any private corporation previously charered to develop the Santee-Cooper project, a full report of the proposed acquisition shall be submitted to the advisory board. After a public hearing and investigation of the proposed acquisition, the advisory board files a written report with the board of directors of the Authority and with the Secretary of State. Details regarding actual purchase and/or condemnation of the proposed acquisition are set forth. The board of directors exercises the powers of the Public Service Authority, except for such duties as are imposed by this chapter upon the advisory board. Upon the appointment and organization of the Public Service Authority, it shall immediately proceed with the development and improvement of the Santee, Cooper, and Congaree rivers and their tributaries upstream to aid commerce and navigation, flood control, and the development of hydroelectric power. The Authority shall have the power to acquire or develop as early as practicable other existing power and navigation projects in the state. (Carruthers-Florida)

KANKAKEE LANDS.
Ind Ann Stat secs 62-605 thru 62-606, 62-611 thru 62-614, 62-617 thru 62-619 (1962).

Descriptors: *Indiana, *Channel improvement, *Drainage, Legislation, Meanders, Boundaries (Property), Rivers, River beds, Beds, Channels, River flow, Swamps, Land reclamation, Land tenure, Ditches, Assessments, Surveys, Limestones, Administrative agencies, Ownership of beds, Taxing.
Identifiers: Kankakee River, Limestone.

Title to all lands included within the meander line of Beaver Lake is confirmed in the grantees holding under a deed of the governor. All unsold lands included within said meander line shall be disposed of according to law. The state auditor may accept trust deeds to Kankakee bed lands for drainage and channel improvement purposes. The governor is to appoint commissioners to supervise the clearing of the channel. The governor is authorized to expend funds derived from the sale of swamp lands bordering the Kankakee River to improve the Kankakee River within the state. The state auditor is ordered to sell all swamp meandered lands along the river in certain named counties. The selling price may include assessments based on the benfits to the land from local drainage ditches. Upon sale, the auditor is to notify the respective local taxing authorities. UNITED STATES RIVER TREATIES,
Ludwik A. Teclaff.
Fordham L Rev, Vol 31, No 4, p 697-726, Apr 1963. 30 p, 212 ref.

Descriptors: *United States, *Rivers, *Treaties, *International waters, Mexican Water Treaty, Riparian rights, Legal aspects, Mississippi River, St Lawrence River, Mexico, Federal government, Foreign waters, International law, Alluvium, International Boundary and Water Commission, International commissions, Navigation, Accretion (Legal aspects).

There is little customary international river law in this article. It is the general duty of riparians to conclude agreements concerning the use of an international river. Treaties to this effect date back to the twelfth century. The development of nonconventional international river law in North America is presented. Negotiations and treaties between the United States, France, Spain, Mexico, Great Britain, and Canada are discussed. Agreements concerning United States rivers are all bilateral and secure free navigation for the contracting parties, whereas treaties concerning rivers elsewhere are both multilateral and bilateral. Treaties concerning the Mississippi, United States-Canadian boundary waters, other United States-Canadian waters, and United States-Mexican rivers are discussed from the standpoint of navigation, changing river beds, and uses of water other than for navigation. Treaties of the United States with Mexico and Canada are given special attention as are treaties with nonriparians pertaining to commerce and navigation. The settlement of disputes and the termination of treaties due to war and the problems of succession are discussed. Comparisons with the European fluvial system are given brief attention. The conclusion focuses on the salient features of United States river treaties as well as the negative characteristics of the system. (Moulder-Florida)

THE TERRITORIAL SEA: A QUEST FOR UNIFORMITY,
Oscar Svarlien.
U Fla L Rev, Vol 15, No 3, p 333-351, Fall-Winter 1962. 19 p, 86 ref.

Descriptors: *Law of the sea, *Oceans, *International law, *International waters, International commissions, Fish conservation, Fisheries, Legal aspects, Foreign waters, Treaties, Littoral measurement, Continental shelf, Continental margin, Governments.
Identifiers: *Territorial seas.

While it is generally agreed that a nation is entitled and obliged to exercise sovereignty over its marginal seas, two central problems remain unresolved. They concern both the degree to which, and the area over which, such sovereignty may be exercised. Subject to the rights of foreign vessels to innocent passage and shelter in distress, a nation may exercise the same degree of sovereignty over its marginal waters as it exerts over its land. However, no general agreement among nations exists as to the extent of those waters. Historical precedents regarding extent are examined as are present claims by the United States, some Latin American nations, and Russia. Methods used in measuring territorial waters are discussed with emphasis on the Anglo-Norwegian Fisheries Case, (1951) I.C.J. Rep. 116. Some problems associated with the delimitation of territorial waters are the concern for national security, the traditional principle of freedom of the seas, and the conservation of fishery resources. A survey of the progress made toward delimiting territorial waters examines fishery treaties and attempts at international codification in the area of delimitation. Since the three-mile limit is unpopular with nations, a twelve-mile limit is suggested. (Marsee-Florida)

THE GREAT POND ORDINANCE--COLLECTIVISM IN NORTHERN NEW ENGLAND,
Lincoln Smith.
Boston U L Rev, Vol 30, No 2, p 178-190, Apr 1950. 13 p, 45 ref.

Descriptors: *Maine, *Massachusetts, *Great ponds, *History, New England, Water law, Judicial decisions, Legislation, Federal-state water rights conflicts, Hydroelectric power, Public rights, Reasonable use, Lakes, Legal aspects, Dam construction, Relative rights, Competing uses, Eminent domain, Usufructuary right.
Identifiers: *Common law, *Public ownership, Public waters.

Basing his article on historical development rather than legal analysis, the author traces the collective theory ordinance in Maine and Massachusetts which places under public ownership all non-tidal ponds of twenty or more acres. Although contrary to both the common law and the traditional opposition to collectivism in Northern New England, this exception stems from the necessity of allowing free fishing and fowling privileges to householders in the colonial days. Extended from the mere right to use these great ponds, judicial interpretation through the years has developed this right into public ownership. The many problems that this ordinance has brought about are the main subjects of the article. Attempts by private corporations to take advantage of this public ownership have been the greatest source of difficulties in recent years. In the future, the author foresees a major conflict between federal and state authorities in relation to control and distribution of hydroelectric power from these great ponds. It is suggested that the peculiar state interest created by the great pond ordinance may give Maine and Massachusetts a bulwark of defense should Washington try to impose its authority contrary to local desire. (Schram-Florida)

WATER AND WATERCOURSES--RIPARIAN RIGHTS AS APPLIED TO ARTIFICIAL WATERCOURSES,
William Kramer.
U Mo Kan City L Rev, Vol 33, No 1, p 143-146, Winter 1965. 4 p, 12 ref.

Descriptors: *Missouri, *Riparian rights, *Artificial watercourses, *Mills, Competing uses, Diversion, Irrigation water, Non-navigable waters, Remedies, Water law, Judicial decisions, Artificial use, Legal aspects, Reasonable use, Relative rights.
Identifiers: *Adverse possession, *Adjacent landowners, Reciprocal rights, Injunction (Mandatory).

Bollinger v Henry, 375 SW2d 161 (Mo 1964), tests the relative rights of adjacent landowners in an artificial watercourse. The watercourse involved was a mill race which had been moved slightly onto the land of an adjacent landowner, with his permission, to straighten out a sharp curve. The adjacent landowner had pumped water from the mill race for five years and, although he could show no actual damages, the owner of the mill race sought injunctive relief from such removal. In refusing to grant this relief, the Missouri Supreme Court ruled that the adjacent landowner had riparian rights in the mill race. The court recognized the general rule that riparian rights do not usually attach to artificial waterways, but applied the exception that where owners of different parcels of land conduct water across both parcels in an artificial channel and do not define their respective interests in the water, their reciprocal rights thereto are to be measured and determined as if they were riparian owners. Reasons for this exception to the general rule are given through a historical case development. The fact that previously this exception applied only to incidents where there had been mutual participation of the landowners involved in the construction of the waterway is discussed, and possible consequences of this new decision are given. (Schram-Florida)

CONCURRENT JURISDICTION OF A NAVIGABLE BOUNDARY RIVER.

Md L Rev, Vol 9, p 268-281, 1948. 14 p, 54 ref.

Descriptors: *Boundary disputes, *Interstate, *Jurisdiction, *Maryland, Judicial decisions, Interstate rivers, State jurisdiction, Interstate compacts, Rivers, Navigable rivers, Boundaries (Property), River beds, Virginia, State governments, Local governments, Legal aspects.
Identifiers: Potomac River, Criminal proceedings.

Questions of concurrent jurisdiction of courts over crimes committed on navigable rivers as between two counties within a given state bordering the river and as between two states whose boundary is the river are raised in Barnes v State, 47 A2d 50 (Md. 1946). The appellant, a Virginia citizen, had been convicted in Maryland for a crime committed on a steamboat on the Potomac River. He attacked the decision alleging lack of jurisdiction in the Maryland county and lack of Maryland jurisdiction to try him. Prince George's County, Maryland, pursuant to Maryland laws giving concurrent jurisdiction to the various counties from, to, or through which a steamboat may travel, convicted the appellant following grand jury indictment. That county had exclusive jurisdiction in Maryland to try the appellant because it was the first county to assume jurisdiction. Virginia, Maryland, and the Congress, by agreement in 1877, had fixed the low water mark on the Virginia shore as the boundary between the states. Maryland therefore had exclusive jurisdiction on the Potomac for criminal offenses. The decision was affirmed on appeal to the Court of Appeals and certiorari was denied by the United States Supreme Court. (McDonough-Florida)
W70-00524

PROPERTY RIGHTS OF RIPARIAN OWNER IN MISSOURI WITH RESPECT TO OBSTRUCTION OF A NATURAL OR ARTIFICIAL WATERCOURSE,
Paul A. Hanna.
Mo L Rev, Vol 18, No 1, p 67-74, Jan 1953. 8 p, 29 ref.

Descriptors: *Missouri, *Riparian rights, *Surface waters, *Obstruction to flow, Judicial decisions, Surface drainage, Surface runoff, Land tenure, Lakes, Artificial watercourses, Natural streams, Damages, Levees, Dams, Natural flow, Legal aspects, Natural streams, Relative rights.
Identifiers: Common enemy doctrine.

In the case of Happy v Kenton, 247 SW 2d 698 (Mo 1952), plaintiff and defendants were both landowners on a natural lake. Defendants constructed a levee on their land across an outlet through which water had previously drained from the lake. Because of the levee, the water level of the lake was raised and the size of the lake increased causing damage to plaintiffs' crops. Plaintiffs contended that defendants had obstructed a natural watercourse. Defendants argued that they had only prevented surface water from flowing across their lands. The principal issue was whether defendants had obstructed a natural watercourse. There was evidence in the case that the outlet had been artificially deepened following the lines of natural drainage and that the drain was a definite channel in which water flowed most of the year. The Missouri Supreme Court held that the drain should be considered as a natural watercourse and affirmed the lower court verdict. Missouri is committed to the doctrine that one may not obstruct a natural watercourse without liability for ensuing damages to others, but that one may otherwise treat surface

waters as a common enemy and obstruct their flow without liability for ensuing damages so long as he does so reasonably and not recklessly or negligently. At least until 1953, the Missouri courts had not definitely decided on the rule to be followed in situations like the instant case. (Heckerling-Florida)

CIVIL LAW PROPERTY--BEDS OF NAVIGABLE WATERS--SUSCEPTIBILITY OF PRIVATE OWNERSHIP.

La L Rev, Vol 15, No 2, p 463-465, Feb 1955. 3 p, 16 ref.

Descriptors: *Louisiana, *Ownership of beds, *Navigable waters, *Public rights, Legislation, Judicial decisions, Land tenure, Patents, Leases, Water law, Beds, Beds under water, Legal aspects.
Identifiers: *Alienation of beds, Statute of limitations, Private ownership.

The title to beds of navigable waters in Louisiana has traditionally been considered to have vested in the state since its admission to the Union in 1812. Such beds are considered by the Civil Code to be publicly owned by the 'whole nation' and not susceptible of private ownership. Further, the Louisiana Constitution prohibits alienation of the beds of navigable waters. California Co v Price, 74 So 2d 1 (La 1954) apparently reverses this traditional view. In that case the plaintiff sought a determination of the ownership of royalty funds from oil wells located under navigable waters on beds leased from a private owner who claimed title based on a state patent. The court in Price held that under Act 62 of 1912 the state was required to annul the patent within 6 years or the title to beds of any navigable waters found upon the conveyed lands would pass to the private owner. Immediately after the decision, Act 727 of 1954 was enacted to overrule the court; it reiterated the public policy against alienation of beds of navigable bodies of water. The 1954 Act further interprets the Act of 1912 as applying only to land susceptible of private ownership. Considering this pronouncement of legislative intent, disputes in this area of law should be closely examined. (Harris-Florida)

WATER LAW AND ADMINISTRATION - THE FLORIDA EXPERIENCE,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 1, p 1-28, 1968. 6 fig, 6 tables. OWRR Project A-001-FLA.

Descriptors: *Florida, *Long-term planning, *Water resources, *Water resources development, Riparian rights, Water law, Navigable waters, Non-navigable waters, Boundaries (Property), Recreation, Docks, Consumptive use, Legislation, Permits, Surface runoff, Federal government, Administrative agencies, State governments, Water management (Applied), Water pollution control, Ownership of beds, Beds under water.

This book represents a detailed examination of Florida Water Law. The introduction sets forth general water facts and quantitative water needs of Florida. The major areas covered in the next eleven chapters are: rights in defined waterbodies--riparian rights; ownership of upland as the source of riparian rights; non-consumptive uses of natural navigable waterbodies; consumptive use of water; common law rules; statutory modification of eastern consumptive use doctrines; rights in disposal of diffused surface water; federal authority and activity affecting Florida's water resources; state administration of water resources; single purpose and multipurpose water management districts; the law and administration of pollution control in Florida; and title to beds under navigable waters. The thirteenth chapter stresses the need for water resources planning and research, both legal and extra-legal. Although Florida has, at present, enough water to meet her needs in the foreseeable future, the authors emphasize the necessity of a master plan for water resources development to insure the maximum beneficial use of this precious natural resource. (See also W70-00528 thru W70-00540). (Wheeler-Florida)
W70-00527

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 1 INTRODUCTION,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 1, p 1-28, 1968. 6 fig, 6 tables.

Descriptors: *Florida, *Statistics, *Water resources, *Water demand, Irrigation, Water supply, Water conservation, Water requirements, Water users, Hydrologic cycle, Surface waters, Precipitation (Atmospheric), Droughts, Evapotranspiration, Floods, Springs, Groundwater, Agriculture, Municipal water, Domestic water, Water quality, Industrial water, Water utilization.

The law has been slow to recognize the interrelationships among the various categories of water. However, legislative and judicial awareness of the hydrologic cycle, specifically Florida's hydrology, is now developing. In attempts to balance the water cycle, the lawmakers not only must study rainfall and drought data, but must also consider the enormous evapotranspiration rate, on which little information is available. Florida's abundant lakes and streams, flat topography, numerous springs, and large groundwater reservoirs further influence the state's particular hydrology. The easily accessible water supply of Florida should exceed the demand in the near future, provided the resource is properly managed. The quantitative needs of all users continue to increase. Ground water is the primary source of municipal supply. Predominant industrial users in Florida are electric power production, the pulp, paper, and chemical industries, citrus processing, and mining. Florida's water resources are also used extensively for navigation and widespread recreational purposes. (See W70-00527). (Wheeler-Florida)
W70-00528

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 2 RIGHTS IN DEFINED WATERBODIES BASIC CONSIDERATIONS,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 2, p 29-65, 1968.

Descriptors: *Florida, *Riparian rights, *Navigable waters, *Federal jurisdiction, Federal government, Legal aspects, State jurisdiction, Water rights, Navigation, Non-navigable waters, Ownership of beds, Riparian waters, Streambeds, Artificial watercourses, Riparian land, Legislation, Regulation, Public rights, Public lands.
Identifiers: Property rights.

Water use rights, both of upland owners and the general public, and the possibility of private ownership of submerged lands are directly affected by a waterbody's classification as either navigable or non-navigable. Riparian rights are generally recognized as property rights attaching to land bordering natural, navigable waterbodies. Florida tests navigability in terms of navigability in fact. The emphasis on navigability in commercial terms may leave recreational interests unprotected. The Florida test differs from federal law in that the former does not include an artificially created present capability. Only a fraction of Florida's lakes were meandered, and the presumption of navigability raised by the federal survey can be rebutted. Although Florida is considered to hold title to beds of navigable waterbodies in trust for its people, public rights in navigable waterbodies have been complicated by state conveyances of many such beds to private interests. Florida's legislation affecting navigability raises interpretational and constitutional problems. The distinction between artificial and natural waterbodies and the effect of the classification on public and private rights is also analyzed. The chapter includes a detailed discussion of a Florida statute which greatly implicates the determination of navigability of non-meandered Florida lakes. (See W70-00527). (Wheeler-Florida)
W70-00529

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE CHAPTER 3 OWNERSHIP OF UPLAND AS THE SOURCE OF RIPARIAN RIGHTS,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 3, p 66-97, 1968. 1 fig, 1 table.

Descriptors: *Florida, *Riparian rights, *High water mark, *Riparian land, Severance, Legal aspects, Banks, Boundaries (Property), Water level fluctuations, Tidal waters, Fresh water, Highways, Judicial decisions, Legislation, Meanders.

Determination of whether the owner of a particular tract of land is entitled to riparian rights often poses difficult problems. Especially complex is the question of whether the tract actually abuts on a navigable waterbody. The high water mark first must be located. This procedure is much more complicated for tidal than nontidal waters. The question whether the water mark, once located, constitutes a boundary of the tract is largely a matter of interpretation of the grantor's intention. If the high water mark and a meander line are substantially coincident, the former is generally considered as the boundary. However, whenever the meander line lies substantially away from the waterbody, most jurisdictions, including Florida, treat the meander line as the boundary. Florida is confronted with troublesome decisions concerning ownership of riparian rights in cases involving platted streets which adjoin and parallel waterbodies. The issues that must be decided on a case by case basis are: (1) does the platted street reach to the water's edge; (2) who owns the street; and (3) whether compatible riparian rights are to be allocated between opposing claimants according to their interests. Several cases have tended to indicate that riparian rights may be lost by certain conveyances of riparian land. (See W70-00527). (Wheeler-Florida)

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 4 NON-CONSUMPTIVE USES OF NATURAL NAVIGABLE WATERBODIES,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 4, p 98-139, 1968.

Descriptors: *Florida, *Non-consumptive use, *Riparian rights, *Public rights, Navigable waters, Riparian waters, Riparian land, Streambeds, Fishing, Swimming, Navigation, Recreation, Access routes, Boating, Water sports, Shores, Docks, Landfills, Ownership of beds, High water mark, Low water mark, Beds, Water levels, Water level fluctuations, Lakes, Dams, Regulation.

Generally, riparian owners are considered to have a valuable right of access to a navigable waterbody. However, the right to navigate, of both riparians and the public, is unsettled, and may be superceded by an overriding public interest. Most courts agree that the public has no right to cross private property to reach navigable waters. Florida takes the

minority position by allowing the public the right to walk along the shores of navigable waterbodies. The right of public boating appears to be recognized in all jurisdictions. Riparians' rights to fish usually are not distinguished from the public's, but questions often arise over exclusive rights and regulation. The taking of the riparian right to swim appears to warrant compensation. Riparians appear to have at least a prima facie right to wharf, which may be denied as a result of conflicting interests. Florida does not seem to recognize any riparian right to fill for nonwharfing purposes, in the absence of statutory authority. Courts probably would not recognize a building right on navigable waterbodies based solely on bottomland ownership. Riparian rights of having a lake maintained at its ordinary level and damming watercourses are discussed. (See W70-00527). (Wheeler-Florida)

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 5 CONSUMPTIVE USE OF WATER: COMMON LAW RULES,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 5, p 140-171, 1968. 6 fig, 1 table.

Descriptors: *Florida, *Consumptive use, *Groundwater, *Surface waters, Surface runoff, Riparian rights, Competing uses, Domestic water, Legal aspects, Municipal water, Reasonable use, Remedies, Water utilization, Percolating water, Aquifers, Hydrogeology, Groundwater basins, Hydrologic cycle, Overdraft, Wells, Surface-groundwater relationships, Damages, Water supply, Saline water intrusion, Underground streams.

Groundwater from limestone aquifers is Florida's principal source of water for consumptive use. The basic problems of groundwater management are: (a) interference between wells; (b) overdraft of the waterbearing bed or aquifer; and (c) contamination. Salt-water intrusion is probably Florida's greatest groundwater contamination problem. Groundwater has been traditionally classified into either underground streams or percolating waters. The significance of the distinctions, however, has been reduced since most jurisdictions, including Florida, now begin with the presumption that groundwater is percolating. However, legal rights continue to hinge upon whether the problems of proof as to the existence of an underground stream can be overcome. Generally, the rights governing surface watercourses apply to underground streams, while the rights regarding percolating waters vary according to whether the common law or reasonable use rule is followed. Many courts hold that as long as the use is beneficial and reasonable, the landowner may use percolating water on overlying land even if such use injures adjoining owners. Florida, however, seemingly applies surface water riparian doctrine to percolating waters. Injunction is usually the preferred remedy respecting groundwater interference. General riparian doctrines are applicable to springs and defined surface waterbodies. With the increasing use of surface waters as a source of supply, the trend is to refine the absolute ownership applicable to such waters. (See W70-00527). (Wheeler-Florida)

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 6 STATUTORY MODIFICATIONS OF EASTERN CONSUMPTIVE USE DOCTRINES,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 6, p 172-197, 1968.

Descriptors: *Florida, *Consumptive use, *Permits, *Regulation, Legislation, Legal aspects, Water utilization, Iowa, Surface water, Surface runoff, Artesian wells, Riparian land, Administrative agencies, Groundwater, Competing uses, Domestic water, Prior appropriation.
Identifiers: Model water use act.

The growing realization of the weaknesses of the riparian system has initiated a trend toward water-rights legislation. Regulation of consumptive use involves the constitutional problem of compensation for any taking of a property interest. The legislative scheme in most eastern states has been to implement permit systems, operated by administrative agencies. Generally, these systems have taken one of three forms: (1) overall compulsory systems; (2) permit systems geared to the needs of problem areas; and (3) permissive permit systems. In 1957, Florida provided for a compulsory permit system in critical areas; however, such regulation is limited since it depends upon the creation of water regulatory districts to become operative. However, the experience in the Pinellas County-Hillsborough County area has demonstrated the great difficulty of regulating water users under this statute. Florida's 1957 law also provides for permissive permits for excess water, and has the apparent advantage of allowing diversion beyond riparian land. However, the law's purpose of encouraging the use of excess water has not been effective since no permits have yet been issued. Another Florida statute regulates the use of artesian wells to prohibit waste and contamination of other water supplies. The authors explore the advantages and problems of eastern permit systems. The eastern system is also compared with the western system of prior appropriation. (See W70-00527). (Wheeler-Florida)

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 7 RIGHTS IN DISPOSAL OF DIFFUSED SURFACE WATER,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 7, p 198-220, 1968.

Descriptors: *Florida, *Surface runoff, *Repulsion (Legal aspects), *Remedies, Damages, Lakes, Reasonable use, Alteration of flow, Ponds, Diversion, Flood control, Natural flow doctrine, Obstruction to flow, Natural streams, Floods, Marshes, Surface waters, Swamps, Civil law, Water law, Riparian land, Riparian rights.
Identifiers: Injunctions (Mandatory), Injunctions (Prohibitory), Common enemy doctrine.

'Diffused surface water' is a catch-all phrase which includes all forms of waters which do not fall within the legal classification of lakes, ponds, and natural watercourses. The problems involving diffused surface water usually concern its disposal rather than its use. The three basic doctrines governing the disposal of diffused surface water are: (1) the civil law rule, (2) the common enemy rule, and (3) the reasonable use rule. The civil law rule, in its pure form, provides that no man may interfere with the natural flow of surface waters. The strict common enemy rule, in contrast, recognizes the right of each landowner to deal as he pleases with surface water on his property without regard to the consequences of such use. The reasonable use rule provides that liability for invasion of an interest in the use and enjoyment of one's land by interference with the natural flow of diffused surface waters depends upon whether the action, if intentional, was unreasonable or if unintentional, was negligent, reckless, or ultra-hazardous. Florida appears to follow the civil law rule. The authors include a discussion of the remedies and defenses available to litigants in the area of interference with surface waters. (See W70-00527). WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 8 FEDERAL AUTHORITY AND ACTIVITY AFFECTING FLORIDA'S WATER RESOURCES,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 8, p 221-257, 1968. 4 fig.

Descriptors: *Florida, *Federal jurisdiction, *Administration, *Watershed management, Water management (Applied), Administrative agencies, Drainage systems, Flood control, Irrigation, Water conservation, Water resources, Land management, Federal government, Legal aspects, National parks, Recreation, Navigable waters, Navigation, Water allocation (Policy), Regulation, Costs, Water distribution (Applied).

The authority of Congress to regulate waterways is grounded primarily on the commerce clause of the Federal Constitution. Federal authority extends to all waterways which are navigable. 'Navigable waterways' in this context are such waterways as are capable of supporting commerce. The federal definition of navigability covers not only watercourses navigable in their natural state, but also those watercourses capable of being improved to the extent necessary to support navigation. Once a watercourse is determined to be navigable, federal jurisdiction attaches and extends to non-navigable portions of the waterbody which affect navigability. In exercising its authority, the federal government has generally not been held liable for injury caused to private property as a direct result of the regulation and improvement of navigable waters. However, there have been exceptions to this general proposition in connection with improvement of non-navigable waters. The Small Watershed Act provides a broad, multipurpose program which includes land treatment, flood prevention, agricultural water management, and public recreational development. Federal and state costs involved in such programs are discussed. The problem of water distribution and transportation from the Central and Southern Florida Flood Control District to the Everglades National Park is examined from both a physical and legal viewpoint. (See W70-00527). (Wheeler-Florida)

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 9 STATE ADMINISTRATION OF WATER RESOURCES IN FLORIDA,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 9, p 258-286, 1968. 3 fig.

Descriptors: *Florida, *Administrative agencies, *Water resources development, *State governments, Legal aspects, Canals, Channels, Fishing, Fish management, Fisheries, Shores, Shore protection, Beaches, Financing, Grants, Artesian wells, Saline water intrusion, Geology, Beds, Ownership of beds, Federal government, Water pollution, Administration, Planning.

State administration of water resources in Florida is primarily the responsibility of four agencies: (1) the Trustees of the Internal Improvement Fund (management of submerged lands); (2) the Air and Water Pollution Control Commission; (3) the State Board of Conservation; and (4) the Game and Fresh Water Fish Commission. The State Board of Conservation has a multitude of functions and controls the bulk of water resources administrative decisions in the state. The various divisions which comprise the Board of Conservation include Survey and Management, Salt Water Fisheries, Geology, Water Resources and Conservation, Beaches and Shores, and Waterways Development (currently coordinating construction of the Cross-Florida Barge Canal). The structures, problems, powers, and duties of each of these divisions are

lly examined. The board also has the responsibili- of coordinating and setting priorities for roposed projects of all state and local agencies. To ffect such evaluation and coordination, an annual onference is scheduled at which all proposed pro- cts for water resources development are resented and evaluated. This approach enables e board to present a unified program of water sources development to the various congres- onal committees to reduce harmful competition r federal funds. (See W70-00527). istorically, single purpose water management dis- icts were created in Florida to drain excess water om the land. Other single purpose districts in lorida include water supply districts, aquaduct stricts, and mosquito control districts. Most early rainage districts were created by special acts by e legislature in 1913. The circuit courts were em- owered to create drainage districts when peti- oned by the State Board of Drainage Commis- oners or by a majority of the landowners in a ven area. The Board of Supervisors of each of ese districts was given the power to construct all anner of works, to acquire needed land, and to ondemn land for rights-of-way. The individual ounties were also empowered to create drainage stricts under separate legislation. These single urpose districts are criticized because they usually e created along political lines rather than accord- g to natural watershed boundaries and deal only ith drainage, which is but one aspect of water anagement. Two multipurpose water manage- ent districts have been created in Florida. The entral and Southern Florida Flood Control Dis- ict has powers over flood control, water conserva- on, prevention of salt-water intrusion, improve- ent of navigation, and development of recrea- onal facilities, including the preservation of fish nd wildlife. In addition to possessing these powers the Central and Southern District, the Southwest lorida Water Management District regulates roundwater through a water regulatory district reated under the 1957 Florida Water Resources aw. (See W70-00527). (Wheeler-Florida)

/ATER LAW AND ADMINISTRATION--THE LORIDA EXPERIENCE: CHAPTER 11 THE AW AND ADMINISTRATION OF POLLUTION ONTROL IN FLORIDA,
lorida Univ., Gainesville. Water Resources esearch Center.
Maloney, S. Plager, and F. Baldwin.
niv of Florida Press, Gainesville, ch 11, p 317-45, 1968.

escriptors: *Florida, *Administrative agencies, Water pollution, *Pollution abatement, State overnments, Legal aspects, Financing, Grants, ederal government, Legislation, Domestic wastes, ndustrial wastes, Standards, Damages, Reasonable se, Remedies, Riparian rights, Public health, Per- its, Agricultural chemicals, Jurisdiction, Ad- inistrative decisions.

Identifiers: Statute of limitations, Laches, Injunctions (Mandatory), Injunction (Prohibitory).

Florida's main pollution problems are domestic and industrial wastes, state authorization of pollution, and agricultural chemicals. The common law remedies have proven inadequate to control pollution. Riparian owners are hampered by the uncertainty of determination of reasonable use. Although the preventive relief by injunction is preferred over a damage action, equitable jurisdiction is more difficult to secure. Florida's tendency toward restricting permanent damage suits creates the likelihood that successive suits must be brought. Furthermore, the defenses of the statute of limitations, prescription, and laches may deny relief altogether. Due to the weaknesses of the remedies and the realization that courts lack the ability to formulate comprehensive programs, Florida utilizes primarily the administrative process for pollution control. In 1967, Florida completely revamped its pollution control program with passage of the Air and Water Pollution Control Act. This legislation placed primary jurisdiction over pollution control in the new Florida Air and Water Pollution Control Commission. The advantages of a specialized agency were augmented by providing the commission extensive powers. Permits may be required for the construction of disposal facilities, and provisions for stiff civil sanctions should overcome the weaknesses of reluctance of invoking criminal sanctions. The chief problem the new commission faces is financing, and if this and other elements of support are not secure, federal intervention appears inevitable. (See W70-00527). (Wheeler-Florida)

WATER LAW AND ADMINISTRATION--THE FLORIDA EXPERIENCE: CHAPTER 12 TITLE TO BEDS UNDER NAVIGABLE WATERS,
Florida Univ., Gainesville. Water Resources Research Center.
F. Maloney, S. Plager, and F. Baldwin.
Univ of Florida Press, Gainesville, ch 12, p 346-405, 1968. 1 fig.

Descriptors: *Florida, *Ownership of beds, *Navigable waters, *Legislation, Beds, Beds under water, Boundaries (Property), High water mark, Low water mark, Riparian rights, Seashores, Civil law, Legal aspects, Lakes, Rivers, Oceans, Bays, Bulkhead line, Landfills, Judicial decisions, Accretion (Legal aspects), Channels, Federal government, State governments, Grants, Meanders.

Florida law relative to ownership of beds under navigable waters requires lengthy explanation, and, even then, defies any real degree of certainty. In general, the beds of navigable waterbodies are held by the state in trust for the people. However, most of the beds of navigable waterbodies have been alienated to private interests by either the Spanish, federal, or state governments; lakes which were not meandered by original government surveyors were presumed non-navigable. However, because of the hazards and other difficulties involved, only a fraction of Florida's lakes were meandered. Therefore, the beds of most of the navigable lakes were sold due to the erroneous presumption of non-navigability. Furthermore, the law is complicated by various uncoordinated legislation which purported to divest the state of title to certain submerged lands. The Riparian Act of 1856, the Butler Bill and the Bulkhead Act and its amendments are analyzed. The Bulkhead Act of 1957 as amended provides for the establishment of bulkhead lines and sets up rules for the sale of tidal lands and the filling of submerged lands. The legal problems relative to title to land formations constantly being altered by accretion, reliction, and avulsion are also discussed. In conclusion, the authors recognize the need for formulation of new rules to protect public rights and to correct past infringements of these rights. (See W70-00527). (Wheeler-Florida)

EMINENT DOMAIN--NAVIGATIONAL SERVITUDE--EFFECT ON EVALUATION OF PORT SITE PROPERTY,
Kenneth L. Keene.
Land and Water L Rev, Vol 4, No 1, p 200-208, 1969. 9 p, 47 ref.

Descriptors: *United States, *Eminent domain, *Compensation, *Riparian rights, Judicial decisions, Damages, Navigation, Construction, Dams, Rivers, Streams, Condemnation, Condemnation value, Evaluation, Easements.
Identifiers: Navigational servitude.

The case of United States v Rands, 88 S Ct 265 (1967), illustrates the extent to which the navigation servitude doctrine may be applied. In 1963, the United States condemned Rands' property for a river development project and did not compensate him for the value of his land as a potential port site. The United States Supreme Court upheld the ruling saying that to compensate this would be to allow additional value representing a private right in what is obviously the public domain. An examination of the relationship between the fifth amendment, eminent domain, the commerce clause, and the navigation servitude doctrine shown that generally the federal government need not compensate private riparian owners for damages resulting from condemnation proceedings concerning the flow of waters. The refusal to compensate is based upon two arguments: (1) no private property right is being taken, only a public right; (2) the government is exercising its paramount navigational power to which riparian rights have always been subject. There is a need for a change in this policy for two reasons: (1) the public should pay for that which benefits the public; (2) riparian owners are reluctant to develop their land for fear of condemnation. (Darragh-Florida)

INTERFERENCE WITH THE PUBLIC RIGHT OF NAVIGATION AND THE RIPARIAN OWNER'S CLAIM OF PRIVILEGE,
Sheldon J. Plager.
Mo L Rev, Vol 33, No 4, p 608-635, Fall 1968. 28 p, 116 ref.

Descriptors: *Navigation, *Riparian rights, *Public rights, *Water policy, Legislation, Judicial decisions, Damages, Access routes, Bodies of water, Navigable waters, Riparian land, Federal government, State governments, Bridge construction,

Public benefits, Structures, Upstream, High water mark, Rivers, Bridges, Legal aspects.
Identifiers: Improvements, Nuisance (Public), Nuisance (Private).

Entering and leaving a navigable body of water usually involves the use of adjacent upland. The courts may hol ' such crossing to be a trespass or it may feel that tl.e riparian has not been injured. In cases where the government makes improvements which materially impair the riparian owner's access to the waterbody, the courts attempt to strike a balance. This area has been highly litigated. As regards the right to navigate, the riparian owner has at least the same rights as any member of the general public. The public has a protected right to navigate except when the federal or state governments require improvement of any waterway for the general good. When the navigation of a stream is impaired or cut off, whether or not the riparian may recover compensation for the loss of his navigation right depends on the type of damage he sustained. If he suffered special damages he might recover. In certain cases the state legislatures expressly authorized structures which impaired navigation, and whether the riparian was damaged was decided by the courts. However, if the structure was expressly authorized by Congress, the federal courts could not recognize any riparian right. Whether structures may be built in a navigable stream is a matter of government policy. (Heckerling-Florida)

OWNERSHIP OF BEDS: POWER TO CONVEY WHEN STATE HAS TITLE.

Minn L Rev, Vol 32, p 484-495, 1948. 12 p, 61 ref.

Descriptors: *Beds under water, *Navigable waters, *State governments, *Ownership of beds, Judicial decisions, Federal government, Easements, Legal aspects, Riparian land, Land tenure, Minnesota, Beds.
Identifiers: Common law.

This note analyzes the views of American courts on the problem of determining the nature and extent of the ownership of the beds of navigable waters. Under the English Common Law, tide lands were prima facie owned by the sovereign while the beds of fresh waters were owned by the riparian landowners. This view was adopted by some American courts. Other states have adopted a different view. Mostly as a result of Supreme Court decisions, it is now settled law that each of the states formed out of the public domain, on admission to the Union, took the title to the beds of all public waters except those which had previously been alienated by the federal government. The courts of some states formed out of the public domain have held ownership of beds under navigable waters to be in the riparian landowners, but have reserved a public right of passage protected by an easement. Questions of ownership of navigable water beds have generally been resolved in favor of the state, but the question of what the state may do with these beds has as yet not uniformly been answered by the courts of the various jurisdictions. The majority seems to favor inalienability of such lands. (Heckerling-Florida)

FEDERAL ENCROACHMENT ON STATE WATER RIGHTS,
Clarence A. Davis.
ABA Section of Mineral and Natural Resources Law (1959 Proceedings), p 80-92, 1959. 13 p, 14 ref.

Descriptors: *Federal jurisdiction, *Federal-state water rights conflicts, *State jurisdiction, *Legislation, Proprietary power, Water law, Treaties, Political aspects, Judicial decisions, Riparian rights, Appropriation, Mexican Water Treaty, Submerged Lands Act, Desert Land Act, Federal Power Act, Boulder Canyon Project Act, Federal government, Water rights, State governments, Legal aspects.
Identifiers: *Constitutional law, Delegation of powers.

Federal encroachment on state water rights is discussed in relation to federal constitutional law. Rather than undertaking a detailed analysis of the cases, the author confines himself to the consequences that flow from the various legal theories upon which the federal government bases its power. These include the power to regulate interstate commerce, the war power, the property clause, the general welfare clause, and the treaty power. Focusing on state water rights in the West, the author reveals how these constitutional powers have been extended through federal legislation and court interpretation to place water resources under federal control. In relation to the possible unconstitutional delegation of power over federal water rights, seventeen instances of congressional legislation recognizing the supremacy of state laws are discussed. Rather than drawing any conclusions, the author points out the legal problems and claims of the contending forces and leaves the conclusions to the reader. An appendix, outlining provisions of federal statutes in recognition of state law as governing water rights, is included. (Schram-Florida)

FISHING AND RECREATIONAL RIGHTS IN IOWA STREAMS AND LAKES.

Iowa L Rev, Vol 53, No 6, p 1322-1346, June 1968. 25 p, 196 ref.

Descriptors: *Iowa, *Recreation demand, *Riparian rights, *Relative rights, Legal aspects, Navigable waters, Ownership of beds, Prescriptive rights, Recreation, Riparian waters, Riparian land, Water utilization, Non-consumptive use, Navigable rivers, Non-navigable waters, Streambeds, Meanders, Public lands, Public rights, State governments, Streams, Lakes, Usufructuary right, Fishing, Federal government.

This note examines the potential recognition of a public right of recreation in Iowa waters previously thought private. The nature of riparian rights and constitutional protections thereof in Iowa's riparian system are surveyed. Rationales for asserting state control over traditionally private waters are based on one of the following: navigability, non-susceptibility of water to private ownership and exclusive control, prior use or custom, and practical considerations of the usefulness of the water for the asserted activity. These bases are discussed separately. The federal and Iowa tests of navigability are compared. Also discussed are the following: (1) relationship of navigability to bed ownership; (2) severability of bed ownership from control over the water, (3) relation of navigability to public rights; (4) state concepts of navigability; (5) trust theories and impressing private beds with public trusts; (6) state ownership of waters; (7) self-help; (8) right of access to waters; (9) the reasonable use limitation on riparian rights; and (10) the distinction between lakes and streams. The best approach to the problem would seem to be the practical considerations doctrine which balances the interests of the parties. (Marsee-Florida)
W70-00550

FISHING AND RECREATIONAL RIGHTS IN IOWA STREAMS AND LAKES.
Iowa L Rev, Vol 53, No 6, p 1322-1325, June 1968. 25 p, 196 ref.

Descriptors: *Iowa, *Recreation demand, *Riparian rights, *Public rights, Relative rights, Legal aspects, Recreation, Riparian waters, Riparian lands, Water utilization, Non-consumptive use, State governments, Usufructuary right, Fishing, Federal government, Regulation.

This note examines the potential recognition of a public right of recreation in Iowa waters previously thought private. The precise extent of the riparian interest in water suitable for public recreation has not been determined in Iowa. Riparian rights constitute property interests and are protected under both the federal and Iowa constitutions. Abrogation of those rights must be justifiable as something other than an uncompensated taking of property. Three approaches might be taken to recognize a public right in waters deemed private. First, riparian rights are not absolute but are subject to limitation within the riparian system. A dominant right, such as a public right of navigation, may limit the riparian right. Second, riparian rights are subject to reasonable state regulation in the public interest. The major problem is separating valid regulation from an invalid taking of property. Third, since riparian rights are judicial creatures, in the absence of a clearly established public policy protecting such rights they may be altered or limited by adverse adjudication. (Marsee-Florida)
W70-00551

FISHING AND RECREATIONAL RIGHTS IN IOWA STREAMS AND LAKES.
Iowa L Rev, Vol 53, No 6, p 1326-1334, June 1968. 25 p, 196 ref.

Descriptors: *Iowa, *Recreation demand, *Riparian rights, *Navigable waters, Relative rights, Ownership of beds, Legal aspects, Prescriptive rights, Recreation, Riparian waters, Riparian lands, Water utilization, Non-consumptive use, Navigable rivers, Non-navigable waters, Streambeds, Meanders, Public rights, State governments, Governments, Streams, Lakes, Usufructuary right, Fishing, Federal government.

Rationales for asserting state control over traditionally private waters seem to be based on one of the following: navigability, non-susceptibility of water to private ownership, prior use or custom, or practical considerations of the water's usefulness. Since the federal test of navigability is one of fact while the Iowa test is one of whether the body of water was meandered in the original federal survey of public lands, the question of state or federal bed ownership in Iowa is not settled. Where the bed has passed to private riparian owner, a primary obstacle to the exercise of state control over the waters is encountered. However, it appears that ownership of the bed could be severed from ownership of the waters. Various states have developed a broader test of navigability for determining public rights of recreation than has Iowa. Such broad tests can be a good starting point toward providing more state control, however, such tests would not permit fishing or other recreational rights since at common-law such rights were distinct from navigation. As a corollary to navigation, however, the public has the expanded right to use the riparian owner's shoreline. (Marsee-Florida)
W70-00552

FISHING AND RECREATIONAL RIGHTS IN IOWA STREAMS AND LAKES.
Iowa L Rev, Vol 53, No 6, p 1334-1346, June 1968. 25 p, 196 ref.

Descriptors: *Iowa, *Recreation demand, *Riparian rights, *Relative rights, Legal aspects, Navigable waters, Prescriptive rights, Ownership of beds, Recreation, Riparian waters, Riparian land, Water utilization, Non-consumptive use, Navigable rivers, Non-navigable waters, Streambeds, Meanders, Public rights, State governments, Streams, Lakes, Usufructuary right, Fishing, Public benefits, Reasonable use, Taxes.

Various approaches exist for recognizing a public right of recreation and fishing in traditionally private waters. (1) private stream beds may be impressed with public trusts; (2) prior public use of waters overlying private beds may establish a prescriptive right; (3) custom on a state-wide basis may be sufficient to circumvent traditional riparian rights; and,4) waters within the state may be declared public. These approaches fail to meet the problems involved directly. An alternative involves considering the suitability of the water for public use and balancing public against private interests. One factor to be weighed is the reasonable use limitation on the riparian owner's right; it could be applied where the owner asserts an exclusive right of use against the public. Another factor is the distinction often made between streams and lakes for recreational purposes. Such distinction hinges on practical considerations and the determination that lakes may be suitable for a greater variety of recreational uses than streams. A recognized public right of recreation in waters would be of little use without the right of access. Special tax benefits could encourage riparian owners to open public access ways. (Marsee-Florida)

RIPARIAN RIGHTS IN FLORIDA,
Richard H. Hunt.
U Fla L Rev, Vol 8, No 4, p 393-410, Winter 1955. 18 p, 65 ref.

Descriptors: *Riparian rights, *Florida, *Navigable waters, *Non-navigable waters, Natural use, Reasonable use, Civil law, Submerged Lands Act, Beaches, Ownership of beds, Bulkheads, Sandbars, Islands, Shallow water, Oceans, Legislation, History, Legal aspects, Riparian land, Riparian waters, Coastal structures, Landfills, High water mark.
Identifiers: *Common-law riparian rights, *Sovereignty, *Divestment.

Beginning with the cession of Florida to the United States in 1819, this article traces the development of riparian rights in Florida and discusses its present status. Since riparian rights on non-navigable and navigable waters differ, navigability is defined. The common law riparian rights are discussed using the language of the courts, and court interpretations of the law are given. Riparian acts of 1856 and 1921 are detailed and their effect on the law is shown through recent court opinions. The applicability of special laws to riparian rights is briefly discussed. Riparian rights in relation to Florida's beaches and the seas bounding the state are reviewed. In discussing nonnavigable waters, determination of ownership, use, and possibility of divestment are developed. The article endeavors primarily to outline the present state of the law in Florida by showing its development and, therefore, no conclusions are drawn. (Schram-Florida)

Identifiers: *Common-law riparian rights.

Except for Spanish grants of submerged lands made prior to 1818, Florida applies an admixture of common law and statutory principles in determining the riparian rights of its inhabitants. Riparian rights differ between navigable and nonnavigable waters. Navigable waters in Florida include all lakes, rivers, bays, harbors, or other waters capable of practical navigation for useful purposes. Florida courts have held waters to be navigable even if the water is only suitable for floating rafts and logs or present only at certain seasons. A prime necessity, however, is that the water in its natural state be capable of sustaining navigation without any artificial aid or improvement. Two Florida cases have resolved the common-law rights incident to riparian owners. Riparian owners share with other residents of the state the right to use these waters for navigation. They may exercise the exclusive right of access to the waters from their riparian lands, but the waters and the lands thereunder belong to the state. Riparian rights are property rights and owners cannot be deprived of them without compensation. In addition, any special injury to an owner's use and enjoyment of his riparian land is compensable. (Schram-Florida)

RIPARIAN RIGHTS IN FLORIDA,
Richard H. Hunt.
U Fla L Rev, Vol 8, No 4, p 398-404, Winter 1955. 6 p, 20 ref.

Descriptors: *Florida, *Riparian rights, *Navigable waters, *Riparian land, Reasonable use, Legislation, Ownership of beds, Islands, Bulkheads, Shallow water, History, Landfills, Coastal structures, Riparian waters, Legal aspects, Sandbars, High water mark.

In 1856, the Florida Legislature enacted 'An Act to Benefit Commerce.' This act vested full title to riparian shallows in the riparian proprietors in order that they might fill in the shoreline and erect warehouses and wharves. Subsequent litigation has proved, however, that absolute title remains in the state and the act is a mere grant for a particular and specially defined use. This act was extended in 1921 to vest in riparian owners the title to submerged lands from the edge of the channel to the high water mark when this land is actually filled or permanently improved. Once this is done, absolute title vests in the riparian owner. Failure to bulkhead and fill, however, subjects the owner to divestment by the state. While it is yet undecided, it appears that an owner of a bay or river island cannot extend his land area by bulkheading and filling. This also applies to sandbars and shallow banks. Both private and public rights in certain bodies of water and lands riparian thereto are regulated by innumerable special acts, population acts, and local laws which are beyond the scope of this article. (Schram-Florida)

RIPARIAN RIGHTS IN FLORIDA,
Richard H. Hunt.
U Fla L Rev, Vol 8, No 4, p 404-410, Winter 1955. 7 p, 25 ref.

Descriptors: *Florida, *Riparian rights, *Navigable waters, *Non-navigable waters, Reasonable use, Civil law, Submerged Lands Act, Beaches, Ownership of beds, Bulkheads, Oceans, Legislation, History, Landfills, Legal aspects, Riparian lands, Riparian waters, Seashores, Relative rights.
Identifiers: *Sovereignty, *Divestment, Nuisance.

Recognizing the need of preserving its beaches for public use, the Florida Legislature has not extended to riparian owners on the ocean or Gulf of Mexico the right to bulkhead and fill lands below the high water mark. Any such intrusion by a riparian owner is unlawful and is treated as a nuisance. The Submerged Lands Act passed by Congress in 1953, established a distance of three miles from the coast line of each state as a general offshore limit of the state's right to submerged lands. An additional section, however, extends Florida's seaward boundaries to three geographical miles on the Atlantic Ocean and nine miles on the Gulf of Mexico. If any body of water in the state is nonnavigable in fact, the bed is subject to private ownership. Although undecided, it appears that Florida will follow the civil law reasonable use theory which allows adjacent riparian owners to use the whole body of water. The common law rule, however, only permits each owner to use the water above that portion of the bed owned by him. The question of private ownership of lands under water appears to be subject to possible divestment by holding the body of water to be navigable. (Schram-Florida)

REAL PROPERTY--ALLUVION AND ACCRETION--ARTICLE 509 OF THE LOUISIANA CIVIL CODE,
Philip Claverie.
Tul L Rev, Vol 39, No 3, p 611-617, Apr 1965. 7 p, 28 ref.

Descriptors: *Louisiana, *Alluvium, *Accretion (Legal aspects), *Riparian rights, Bottom sediments, Channel morphology, Thalweg, Channels, Currents (Water), Streams, Running waters, Navigable rivers, Navigable waters, Beds, Riparian waters, Lakes, Judicial decisions, State jurisdiction, Riparian land, Rivers.

The articles of the Louisiana Civil Code that treat alluvion and accretion come directly from the French Code of 1804. The French law provided that riparian owners took title to accretions in rivers and other streams, but not in lakes and ponds. The Louisiana law omitted this section of the French law as well as a codified distinction between two kinds of lakes: public lakes or navigable lakes through which currents move and private lakes or land-locked lakes or ponds. The Louisiana courts have held that a riparian owner does not acquire ownership of accretion forming in lakes, bays, or arms of the sea regardless of their navigability. In the absence of a codified distinction between true lakes and other streams, however, the courts have proceeded case by case to decide whether the particular body of water in question is a river or stream, or a lake or pond. After examining the cases on point, the author concludes that the courts have failed to formulate a definitive test for determining ownership of alluvion formed in navigable waters and urges adoption of the French distinction based upon the presence of currents in the body of water. ESTUARINE LAND OF NORTH CAROLINA: LEGAL ASPECTS OF OWNERSHIP, USE, AND CONTROL,
David A. Rice.
NCL Rev, Vol 46, No 4, p 779-812, June 1968. 34 p, 169 ref.

Descriptors: *North Carolina, *Estuaries, *Tidal marshes, *Land tenure, Estuarine environment, Estuarine fisheries, Bays, Inlets (Waterways), Intertidal areas, Tides, Marshes, Wetlands, Coastal marshes, High water mark, Low water mark, Tidal effects, Navigation, Navigable streams, Riparian rights, Legal aspects, State jurisdiction.

Conservation and protection of estuarine lands in North Carolina are hampered by unresolved controversies over ownership and use of them. Historically tidelands have been held in trust for the public by the sovereign. The state has adopted this principle of British and colonial common law. If the covering water is unnavigable in fact, lands under tidewater may be conveyed to private owners. Confusion in developing a standard test of navigability, and inconsistencies in statutes permitting conveyance of marsh and swamplands have made difficult the classification of lands in regard to their susceptibility to private ownership. Other legal principles must also be considered in dealing with ownership of estuarine lands. Excluding domestic fisheries, ownership of fish and wildlife estuarine resources resides in the state. Another area of concern is ownership of land between high and low water marks. Cases have allowed conveyance where express intent is shown, but their present authority is questionable. The author further mentions statutory changes in the common law rules of accretion, reliction, avulsion, and erosion. The distinction is now between natural and artificial causes rather than between gradual and rapid land loss or gain. (Kelly-Florida)

IOWA WATER LAW: PROBLEMS TO BE CONSIDERED.
Iowa L Rev, Vol 42, No 1, p 102-107, Fall 1956. 6 p, 31 ref.

Descriptors: *Iowa, *Usufructuary right, *Prior appropriation, *Beneficial use, Riparian rights, Condemnation, Natural flow doctrine, Artificial use, Competing uses, Irrigation water, Industrial water, Municipal water, Legal aspects, Legislation, Navigable waters, Ownership of beds, Underground streams, Percolating water, Natural use, Water supply.

Iowa currently suffers a lack of case law and statutes regarding the use of water for consumptive purposes. Beneficial use under the riparian system raises many prospective legal questions which must be resolved. Under this system, only the riparian owner is entitled to beneficial use. In addition, the riparian doctrine only concerns itself with surface and underground streams. Thus, percolating ground water, a valuable resource for irrigation and industry, presents a problem. The greatest difficulty involves competition for available water by industry, municipalities, and irrigation and the conflict between natural and artificial uses. Because condemnation appears impractical, a water law statute regulating beneficial use may be needed. Another possible solution to Iowa's water law problems is beneficial use under the prior appropriation system. Constitutional objections as well as the resulting static condition of water rights, however, make this system unsatisfactory for adoption in Iowa. The solution of legal problems involved in establishing control of water and priority of uses through legislation must, however, await the determination of: (1) the total amount of available water; (2) present beneficial uses; (3) possible future uses; and (4) costs of developing existing and future water supplies. (Schram-Florida)

LITTORAL RIGHTS ON THE GREAT LAKES,
John F. Power.
Notre Dame Lawyer, Vol 20, No 4, p 424-428, June 1945. 5 p, 22 ref.

Descriptors: *Great Lakes, *Littoral, *Riparian land, *Riparian rights, Michigan, Illinois, Indiana, Shores, Boundaries (Property), Lake beds, Lakes, Lake Michigan, Parks, Lake shores, Landfills, Easements, Piers, Docks, Meanders, Accretion (Legal aspects), Legal aspects, Low water mark, High water mark, Relative rights, Contracts.
Identifiers: *Right of adjacency, *Littoral rights.

Littoral is a more accurate term than riparian when referring to ownership on lake shores. Littoral rights necessarily include the right of adjacency although courts disagree as to whether littoral title will vest to the high or low water mark. Except for special purposes, the beds of the Great Lakes are not susceptible to private ownership but are held in public trust by the state. Although early Michigan cases indicated otherwise, both Michigan and Illinois now adhere to the doctrine that littoral rights extend to the waters edge and include rights of adjacency, accretion, and access. However, some exceptional cases have arisen in Chicago where the park system is composed chiefly of filled land and the shoreline is now some distance from its original location. Those cases involve the rights of owners who surrendered their littoral rights to such parks in consideration for the promise that the parks would beautify their property and that their view would remain unobstructed. To possess littoral rights in Indiana, the owner's land must border on the water. The littoral owner's right to fill is commonly governed by legislation today. (Marsee-Florida)

THE LAW OF NAVIGABLE STREAMS IN WEST VIRGINIA,
Philip B. Hill.
W Va L Rev, Vol 59, No 1, p 73-78, Dec 1956. 6 p, 32 ref.

Descriptors: *West Virginia, *Mineralogy, *Ownership of beds, *Navigable rivers, Legal aspects, Administrative agencies, Beds, Permits, Boating, Tidal waters, Virginia, Judicial decisions, Legislation, Dredging, Leases, Remedies, Royalties, Public benefits, Mining, Regulation, Classification, Navigable waters, Easements.

The West Virginia Supreme Court of Appeals held in Campbell Brown and Co v Elkins, 93 SE2d 248 (W Va 1956), that the Public Land Corporation holds title to the beds of all navigable streams in the state and that said corporation may license individuals or corporations to extract minerals from the beds of navigable streams. The test of navigability turns on whether the stream can supply a useful commercial purpose to the public. The Campbell court noted that a stream need be navigable only for such times of the year as to make it valuable to the public. It is well settled in West Virginia that the beds of all navigable streams belong to the state. The Campbell case is interpreted as showing a judicial tendency of permissiveness towards allowing grants of beds with public retention of an easement therein. Present law in West Virginia prevents optimum utilization of mineral resources; this follows because mineral extraction is only permitted through state licensing, and because of state statutes licensees have no remedy when the state revokes their licenses. Statutory leasing provisions are recommended to promote utilization of mineral resources. (Keith-Florida)

THE MOVEMENT FOR NEW WATER RIGHTS LAWS IN THE TENNESSEE VALLEY STATES.
R. H. Marquis, R. M. Freeman, and M. S. Heath, Jr.
Tenn L Rev, Vol 23, No 7, p 797-837, Apr 1955. 41 p, 202 ref.

Descriptors: *Southeast US, *Tennessee River, *Water rights, *Riparian rights, Water utilization, Legislation, Legal aspects, Water law, Prior appropriation, Reasonable use, Natural flow doctrine, Surface waters, Natural streams, Underground streams, Percolating waters, Industrial water, Municipal water, Irrigation, Judicial decisions.
Identifiers: Constitutions.

An increased utilization of water and several years of abnormally low rainfall have stressed the need for a reexamination of the legal rules applicable to water rights in several southeastern states. Changes proposed would replace the existing riparian rights doctrine with the doctrine of prior appropriation. Since 1952, a number of proposals have been introduced into the legislatures and several study groups have been created. Major problems in the area involve supplemental irrigation and municipal and industrial water use. A number of assumptions have been made which underlie the argument in favor of prior appropriation. Many of these are essentially invalid. The author discusses the existing law in the Tennessee Valley states and the states using the prior appropriation doctrine as they apply to (1) surface waters in well-defined streams, (2) surface waters which spread in a diffused state, (3) underground waters in well-defined streams, and (4) underground percolating waters. The author also notes the constitutional questions raised by legislation which would destroy unused riparian rights without compensation. He argues that there are possible alternatives stressing the advantages of both legal doctrines. (Heckerling-Florida)

dentifiers: Torrens Land Act.

Plaintiff owned land lying between the Atlantic Ocean and a North Carolina sound. Some of this and was covered by navigable waters. He sought to njoin alleged trespasses by defendants who main- ained duck blinds within the area plaintiff claimed. The district judge decreed for defendants and laintiff appealed. The court, agreeing with the dis- rict judge, held that the Torrens Land Act, upon vhich plaintiff's claims rested, did not have the ef- ect of vesting title in plaintiff to lands covered by avigable waters. Navigable waters cannot be nonopolized. Title to the land under such waters is eld by the state in trust for the use of the public. A rant of such lands has never been adjudged to be vithin the legislative power. The purpose of a roceeding under the Torrens Land Act is to emove clouds from title, not to validate title to ands which under the laws of the state are not sub- ect to private ownership. Even if title had vested in laintiff, it would be subject to the same trust on ehalf of the public as would be in effect if title were held by the state. (Gabrielson-Florida)

Virginia, Riparian land, Legal aspects, Interstate, Relative rights.
Identifiers: *Potomac River.

Plaintiff brought this suit to enjoin defendant from hauling a seine along the shore of an island located in the Potomac River and owned by plaintiff. On a number of occasions defendant had fished nearer than 100 yards from the shore of the island without permission and against the will of plaintiff. Plaintiff contended that the entry by defendant violated a state law which would give plaintiff first priority in seining in front of the property which he owned. The statute in question was enacted unilaterally by Maryland and never received the consent and approval of Virginia. The court discussed whether the statute abrogated a prior compact between Maryland and Virginia dating from 1785. If the 1785 Compact was still in effect, mutual consent of both states would be required for the statute to be effective. The court concluded that the Compact was still in effect and further that the statute plaintiff relied on was never intended to apply to that area of the Potomac within the jurisdictional boundary of the Compact. Since plaintiff's island was within the boundary of the Compact, judgment was for defendant. (Heckerling-Florida)

PUBLIC WORKS AND CERTAIN PUBLIC AUTHORITIES.

SC Code Ann secs 59-8, 59-14, 59-15 (1962).

Descriptors: *South Carolina, *Administrative agencies, *River basin development, *Water resources development, Navigation, Rivers, Reclamation, Floods, Flood control, Public health, Taxation, Electric power, Local governments, Hydroelectric power, Lakes.

The primary purpose for the creation of the Public Service Authority is the development of the Santee, Cooper, and Congaree rivers as instrumentalities of interstate, intrastate, and foreign commerce and navigation, reclamation of wastelands through flood control projects, and reforestation and improvement of public health in affected areas. Such aid and development is in all respects for the public benefit and is a public purpose. The Public Service Authority cannot be required to pay taxes on any activities or property acquired. Securities issued by the Authority are free from taxation. However, in determining the rate of sale for electric power, the taxes the Authority would have paid if privately owned, are properly to be considered. The Authority shall pay to various counties, municipalities, and school districts situated therein, a sum of money equivalent to the amount paid for taxes on properties at the time of their acquisition by the Authority. The Authority may construct the Santee-Cooper hydroelectric and navigation project as outlined by the Federal Power Commission. One lake constructed by the Authority and belonging to the state, located on the Cooper River near Pinopolis, shall hereafter be known as Lake Moultrie. The other lake so-owned and constructed in that area shall be known as Lake Marion. (Carruthers-Florida)

APPEAL TO WATER RESOURCES BOARD.
W Va Code Ann, secs 20-5A-15 thru 20-5A-16 (1966), as amended, (Supp 1968).

Descriptors: *West Virginia, *Legislation, Permits, Judicial decisions, State governments, Legal aspects, Administrative agencies, Water resources, Waste treatment, Sewage disposal.
Identifiers: *Judicial review.

Any person adversely affected by an order made and entered by the Chief of the Division of Water Resources or aggrieved by his failure to act may appeal to the Water Resources Board. Notice of appeal will not stay the execution of the order unless the Board or the Director of the Department of Natural Resources finds its execution will result in unjust hardship for the plaintiff. For the purposes of conducting such appeal hearing, any member of the Board and the Secretary thereof may issue subpoenas and subpoenas duces tecum in the name of the Board. After hearing all of the testimony, evidence and record in the case, the Board can affirm, modify, or vacate the order of the Chief. In reading this decision the Board considers not only the factors the Chief was authorized to consider but also the economic feasibility of treating and/or controlling the sewage or waste involved. The Chief of the Division of Water Resources or any person adversely affected by a final order made and entered by the Board after such appeal hearing is entitled to judicial review thereof. (Gabrielson-Florida)

CASTAWAYS MOTEL V SCHUYLER (PERMISSION TO BUILD A BULKHEAD).

24 NY 2d 120, 299 NYS 2d 148-153 (1969).

Descriptors: *New York, *Bulkheads, *Beds, *Hydroelectric plants, Legal aspects, Judicial deci-

ions, Port authorities, Public lands, Ownership of beds, Patents, Docks, Obstruction to flow, Recreation, Conservation, Administrative agencies, Retaining walls, Regulation, Control, Administration, St. Lawrence River, Ice, Construction projects, Project purposes.
Identifiers: *Covenants, *Breakwalls, *Niagara River, Yacht clubs, Ice damages.

Plaintiff motel owner applied to defendant Commissioner of General Services for permission to construct a bulkhead in the Niagara River to protect the former's docks from ice damage caused by the Power Authority's Niagara project. Consent was given to begin construction while plaintiff's application was pending. On a determination that plaintiff's bulkhead would not interfere with the power project, defendant approved plaintiff's application, but this approval was contingent upon plaintiff's signing a release to the state and the power authority from any claims occasioned at any time. Plaintiff brought an action in Special Term to compel defendant to approve his application without the condition. Special Term dismissed the petition, Appellate Division affirmed, and plaintiff appealed. Aside from the procedural issues, the Court of Appeals held that applications under Section 75 of the Public Lands Law, dealing with grants of land under water, may be made to promote commerce, insure beneficial enjoyment by owners, or for agricultural purposes, for public park, beach, recreation, or conservation purposes. Since plaintiff's application was for his beneficial use and a determination had been made that plaintiff's bulkhead would not interfere with the power project, his application should have been unconditionally granted. ILLINOIS DRAINAGE CODE.

Ill Ann Stat ch 42, secs 3-1 thru 3-31 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Drainage, *Drainage districts, *Levees, Local governments, Agriculture, Environmental sanitation, Mining, Mine wastes, Engineering, Legislation, Outlets.

Drainage districts may be formed to engage in drainage or levee work for agricultural, sanitary, or mining purposes. Such districts may be organized upon a petition by landowners in the proposed district. After determining the validity of such petition the court shall appoint commissioners who shall examine the area proposed, employ an engineer to report to them, and file a report with the court. A hearing will be held after which the court will either dismiss the proposal or order the organization of the district. This order is final and is appealable. An alternative method of organization is the referendum submitted to the voters upon petition by interested landowners of the proposed district. Outlet drainage districts may be organized by either of the above procedures. Such districts are to aid two or more drainage districts by improving general outlets. Mutual drainage districts may be formed upon agreement of landowners requiring combined drainage facilities to protect their land. The procedure for organization will be the same as either of the above unless the agreement specifies otherwise. (Darragh-Florida)

WEST CENTRAL MISSISSIPPI WATERWAY COMMISSION.
Miss Code Ann secs 5956-301, 5956-306 (Supp 1968).

Descriptors: *Mississippi, *Channels, *Multiple-purpose projects, *Investigations, Legislation, Legal aspects, Public benefits, Navigation, Recreation facilities, Flood control, Irrigation, Water supply, Water resources development, Administrative agencies, Water utilization.

The West Central Mississippi Waterway Commission is created for the purpose of coordinating the effort necessary to develop and create a multipurpose waterway through several specified counties. The Commission is concerned with investigation, feasibility determination, development, and creation of the aforementioned multipurpose waterway. The duties of the Commission include the investigation of the possibility of creation and utilization of a domestic water supply, an industrial water supply, irrigation facilities, flood control facilities, power facilities, navigation facilities and recreation facilities as might be made available from the aforementioned waterway. (Keith-Florida)

STATE OWNERSHIP AND SALE OF SEA SHELLS.
Miss Code Ann secs 6048-01 thru 6048-03, 6048-08 (Supp 1968).

Descriptors: *Mississippi, *Shellfish, *Dredging, *Aquatic life, Legislation, Legal aspects, Oysters, Clams, Regulation, Mussels, Reefs, Beds, Banks, Jurisdiction, Contracts, Tidal waters, Administrative agencies, Commercial fishing, Conservation, Dredging, Financing, Control.
Identifiers: *Shells, *Marine biology, Seafood industry, Cay shells.

All shells of any shellfish within the territorial jurisdiction of the state are the property of the state. The Mississippi Marine Conservation Commission has authority over and control of all such shells. The Commission may contract for the sale of such shells to provide funds necessary for the operation of the Commission. Before the Commission grants any contract for the sale, dredging, and removal of shells, it must obtain a study by a marine biologist to determine whether such dredging can be done without harm to marine life; the Commission must also consult with the Gulf Coast Research Laboratory regarding these matters. The Commission closely regulates the removal of all shells. The Commission pays ten per cent from the proceeds of shell sales to the Gulf Coast Research Laboratory and may appropriate a sum not to exceed twenty-five hundred dollars per year to the Gulf States Marine Fisheries Commission. NORTH CAROLINA AND OTHER ATLANTIC STATES,
Claude L. Love.
Part of 'Water Law in the Eastern United States--A Symposium'. Am Water Works, Ass'n J, Vol 49, No 6, p 721-727, June 1957. 7 p, 10 ref.

Descriptors: *Natural flow doctrine, *Prior appropriation, *WATER ALLOCATION (Policy), *Water policy, Legislation, Water utilization, Beneficial use, Competing uses, Water rights, Riparian rights, Appropriation, Preferences (Water rights), Water conservation, Administrative agencies, Administration, Water law.

As local water supplies in the eastern United States continue to diminish and consumption increases, there is a growing need for legislation dealing with conservation and the equitable distribution of water. Generally, the eastern states with plentiful water supplies have been able to rely solely on the riparian doctrine to control water use. An examination of the legislation of the New England states and North Carolina reveals few statutes regulating the use of water. But, the riparian doctrine is a haphazard and fortuitous method of allocating water rights and as water supplies become limited it would seem wisest for state legislatures to learn from the experience of the drier western states and enact systems of water appropriation. Any legislation creating a system of appropriation should protect vested property rights, insure the greatest beneficial use of water resources, and conserve water resources. An administrative agency should be given the authority to determine rights to water use, to allocate water upon application, and to modify or cancel such allocations when circumstances and needs have changed. Bills have been introduced in the legislatures of several southern states which conform to these suggestions. (Gabrielson-Florida)

SEDENTARY FISHERIES AND ARTICLE 2 (4) OF THE CONVENTION ON THE CONTINENTAL SHELF - A PLEA FOR A SEPARATE REGIME,
L. F. E. Goldie.
Am J Int L, Vol 63, No 1, p 86-97, Jan 1969. 12 p, 36 ref.

Descriptors: *Marine fisheries, *International law, *Continental Shelf, *Natural resources, Treaties, Prescriptive rights, Fish conservation, Fisheries, International waters, Law of the sea, Coasts, Marine geology, Fish management, Commercial fishing, Mussels, Oceans, Legal aspects, Legislation, Ownership of beds, Natural resources.
Identifiers: *Sedentary fisheries.

The sedentary fisheries provision of the 1958 Convention on the Continental Shelf defies determinability as to the exploitation of resources of the shelf and as to what species among natural resources of the shelf are to be covered by its terms. The provision was grafted onto a regime aimed at regulation and exploitation of mineral resources. It is feared that retention of the present article on sedentary fisheries will lead to enclosure movements by coastal states extending exclusive off-shore sedentary fishery rights. The author recommends the deletion of the present provision from the convention and suggests a variation of a 1951 International Law Commission proposed sedentary fisheries regime. This regime would require: (1) that sedentary fisheries be limited to specified species and areas wherein each fishery has been historically carried on; (2) that acquired rights of foreign fishermen based on historical practices should allow them to participate in the fisheries; and, (3) that these acquired rights be subordinated to the rights of the coastal state on the principle of abstention for economic management of the fisheries. All

regimes should be limited to specified depths on the shelf. Modifications could also be accomplished through treaty regimes. (McDonough-Florida)

UNITED STATES LEGISLATION RELATING TO THE CONTINENTAL SHELF,
Oliver L. Stone.
Int'l and Comp L Q, Vol 17, No 1, p 103-117, Jan 1968. 15 p, 57 ref.

Descriptors: *Continental shelf, *Submerged Lands Act, *Oceans, *Ownership of beds, Legislation, Federal government, Continental slope, Continental margin, Navigable waters, Beds, Tidal waters, Aquatic soils, Subsoil, Underwater, Beds under water, Oil, Natural gas, Mineralogy, Inlets (Waterways), Federal-state water rights conflicts, Federal jurisdiction, State jurisdiction, Leases, Exploitation, Drilling, Core drilling, Exploration, Law of the sea, Continental shelf.
Identifiers: Inland waters.

The Submerged Lands Act vests in the coastal states ownership of lands beneath navigable waters, including submerged lands lying within three nautical miles of the coast line. The seaward limit of inland waters remains unsettled, but the dispute over federal-state ownership of the inner continental shelf has been resolved in favor of the states. Following a proclamation by President Truman in 1945, which asserted jurisdiction and control over the continental shelf, the Outer Continental Shelf Lands Act extends exclusive jurisdiction and control of the subsoil and seabed out to whatever limit the United States is legally capable of reaching The Secretary of the Interior is authorized to lease gas, oil, and other mineral rights to private industry. The Act applies the whole body of federal law to the subsoil and seabed of the outer continental shelf plus laws of adjacent states that are not inconsistent. The seaward limits of the Act are flexible, subject to particularizing by the courts according to contemporary concepts and not limited by the often used 100 fathom figure. It has been assumed that the Secretary's leasing authority is co-extensive with the assertion of valid jurisdiction over the continental shelf. (Douberley-Florida)

CURRENT LEGISLATION,
Herbert J. Slaughter.
Fed B J, Vol 6, No 3, p 316-324, Apr 1945. 9 p, 25 ref.

Descriptors: *Legislation, *Tennessee Valley Authority Project, *Federal project policy, *Project purposes, Federal government, Management, Regions, Water resources development, Project planning, Multiple-purpose projects, Columbia River Basin, Administration, Governments, Interagency cooperation, Interstate, Political aspects, Planning, Long-term planning, River basin development, Administrative agencies.

A comparison is made between Congressional bills which have organizational forms patterned after the Tennessee Valley Authority. The Murray bill for the Missouri Valley Authority seeks to centralize the control of all regional programs in a single multi-purpose agency, managed by three directors. The bill envisions a single comprehensive plan for development of the valley and execution of the plan by a single federal agency. The Mitchell bill for the Columbia Valley Authority seeks to integrate the Authority into the general government organizational pattern. A national board supervised by the Secretary of the Interior would review all plans and coordinate them with other agencies. The Interior Department bill seeks to gear agencies more closely to the people concerned in accordance with regional and national plans of natural resources development. Secretary of the Interior supervision and close financial control assures an orderly development of national resources through existing agencies. The Rankin bill proposes nine authorities to cover the entire nation, each controlled by a separate administrator and coordinated by the President. The author cautions against programs that ignore existing agencies and working arrangements. (Douberley-Florida)

THE WANDERING MISSOURI RIVER: A STUDY IN ACCRETION LAW,
Robert E. Beck.
N D L Rev, Vol 43, No 1, p 429-466, Fall 1966. 38 p, 163 ref.

Descriptors: *Accretion (Legal aspects), *Missouri River, *Avulsion, *Riparian rights, Riparian land, Boundaries (Property), Rivers, Levees, Dams, Flood protection, Iowa, North Dakota, South Dakota, Kansas, Missouri, Nebraska, Montana, Judicial decisions, Water law, Legal aspects, River flow.

The Missouri River, a stream whose course has long been characterized by rapid changes and alterations, provides the background for a study of accretion law. A discussion of the historical rationales behind the basic accretion doctrine is presented. The author notes that the seven states bordering the Missouri River all apply the accretion doctrine to the stream in spite of its vagrant nature. However, because of the river's frequent wandering, it is particularly difficult to distinguish accretion from avulsion. The characteristics of avulsion and the evidentiary problems in proving it are discussed. A review is presented of case decisions in the states bordering the Missouri River concerning the ownership of riparian land which has been completely submerged but at a later date is bared and readily identifiable. It is suggested that these states re-introduce a consideration of the time element in deciding cases of this nature. Such a consideration would allow the courts flexibility which does not presently exist. (Gabrielson-Florida)
W70-00777

THE WANDERING MISSOURI RIVER: A STUDY IN ACCRETION LAW,
Robert E. Beck.
N D L Rev, Vol 43, No 1, p 429-439, Fall 1966.

Descriptors: *Accretion (Legal aspects), *Missouri River, *Avulsion, *Riparian rights, Riparian land, Boundaries (Property), Alluvium, Erosion, River flow, Legal aspects, Iowa, North Dakota, South Dakota, Kansas, Missouri, Nebraska, Montana, Judicial decisions, Water law, Access routes.
Identifiers: Dereliction, Reliction.

The wandering nature of the Missouri River has placed a heavy burden on the law of accretion, especially where formerly inundated land is again bared. This situation is the focal point of this article. Accretion, dereliction, erosion, avulsion, and alluvion are distinguished and defined. Generally alluvion formed by accretion or reliction belongs to the owner of the adjacent land, irrespective of who owned the bed at the time. However, when avulsion occurs, ownership does not change. Six rationales exist for shifting boundaries when accretion and reliction are involved: (1) new land, by accession, ought to belong to the land to which it was added; (2) the river is a natural boundary and when the river moves, the boundary moves; (3) since accretion is gradual and imperceptible, it is a trifle with which the court will not concern itself; (4) the adjacent owner is in the best position to make productive use of the land; (5) since the riparian owner is subject to the risk of loss by action of the water, he ought to benefit from a gain; and (6) the right of access to the water must be preserved. (Marsee-Florida)
W70-00778

THE WANDERING MISSOURI RIVER: A STUDY IN ACCRETION LAW,
Robert E. Beck.
N D L Rev, Vol 43, No 1, p 439-451, Fall 1966.

Descriptors: *Accretion (Legal aspects), *Missouri River, *Avulsion, *Riparian rights, Riparian land, Boundaries (Property), Rivers, Levees, Dams, Iowa, North Dakota, South Dakota, Kansas, Missouri, Nebraska, Montana, Judicial decisions, Water law, Legal aspects, River flow, Alluvium, Erosion, Riprap, Relative rights.
Identifiers: Reliction.

Since the doctrine of accretion requires gradual and imperceptible change, an important question is whether the law of accretion applies to the quick-changing Missouri River at all. Generally, courts have applied the law of accretion to the Missouri. Another problem is distinguishing between accretion, reliction, and erosion on one hand and avulsion on the other. The article looks in detail at the differences between erosion and avulsion. In determining whether avulsion, accretion, reliction, or erosion has taken place, at least four categories concerning evidence or proof can be established: (1) eye-witness testimony as to the rapidity of the action; (2) soil composition and other geological data; (3) size and kind of vegetation; and (4) presumptions. Several courts have accepted a rebuttable presumption in favor of accretion. The question of how man-made activity on the River affects the doctrine of accretion should also be considered, especially in light of recent stabilization work. Generally, Missouri River courts have deemed irrelevant the fact that alluvion has formed because of artificial barriers such as dams, levees, or dikes unless the riparian owner involved has been primarily responsible for its creation. (Marsee-Florida)
W70-00779

THE WANDERING MISSOURI RIVER: A STUDY IN ACCRETION LAW,
Robert E. Beck.
N D L Rev, Vol 43, No 1, p 451-466, Fall 1966. 38 p, 163 ref.

Descriptors: *Accretion, *Missouri River, *Avulsion, *Riparian rights, Riparian land, Boundaries (Property), Rivers, Levees, Dams, Iowa, North Dakota, South Dakota, Kansas, Missouri, Nebraska, Montana, Judicial decisions, Water law, Legal aspects, River flow, Alluvium, Erosion, Relative rights, Legialation, State governments, Regulation, Control.

In applying the accretion doctrine to such rapid changes as occur on the Missouri River, two questions seem of primary importance. How important are the theories underlying the accretion doctrine today. Who are competing for a particular tract of land, private parties or a private party versus the state. A review is presented of case decisions in the states bordering the Missouri River concerning the ownership of riparian land formerly inundated but later bared and readily identifiable. It is concluded that: (1) these states should re-introduce a consideration of the time element in deciding cases of this nature; (2) all seven Missouri River states have accepted the doctrine of accretion notwithstanding the quick-changing nature of the Missouri; (3) the accretion doctrine should be applied when the contest involves a private party versus the state, and the presumption should be in favor of accretion as contrasted with avulsion; (4) legislation should not be necessary to import the time element consideration into the determination of disputes, but this may be the best route; and (5) the time element consideration should apply to

both government and private boundary lines. (Marsee-Florida)

TIDELANDS IN SOUTH CAROLINA: A STUDY IN THE LAW OF REAL PROPERTY,
W. Turner Logan, and Ruth Williams.
S C L Rev, Vol 15, No 3, p 657-676, 1963. 20 p, 49 ref.

Descriptors: *South Carolina, *Public lands, *Land tenure, *Tidal marshes, High water mark, Low water mark, Tidal waters, Navigable waters, Estuaries, Legal aspects, Boundaries (Property), Ownership of beds, Marshes, Wetlands, Land reclamation, Judicial decisions, Riparian rights, Navigable rivers, Reclamation.
Identifiers: Adverse possession.

It is commonly stated that land between the high and low water marks of tidal navigable streams (hereinafter referred to as marshland) belongs to the public, and that the state holds it in trust. The author questions the applicability of this theory in South Carolina. Older decisions indicate that marshlands are grantable, and only dictum in one often-cited case contradicts this. More recent holdings have permitted private ownership of marshlands. Case law in South Carolina suggests that adverse possession may operate against the state. If marshland is susceptible to private ownership, a 'presumption of grant' from the state should apply to marshland to the same extent as it does to other grantable state lands. The value of marshland in terms of reclamation and in regard to agricultural potential, to hunting, and to mineral deposits, demands that a new and critical analysis of its legal status and susceptibility to private ownership be made. COMMISSIONERS OF STEAMSHIP TERMINALS.

Conn Gen Stat Ann secs 15-27 thru 15-31 (1958), as amended, (Supp 1968).

Descriptors: *Connecticut, *Transportation, *Bridge construction, *Navigable waters, Legislation, Legal aspects, Administrative agencies, Cities, Construction, Maintenance, Docks, Piers, Dikes, Canals, Jurisdiction, Maps, Surveys, Rivers, Harbors, Banks, Erosion, Easement, Riparian rights, Permits, Structures, Costs, Watersheds (Basins), Civil engineering, Ships, Financing, Transportation control, Federal government, Regulation, Control.
Identifiers: *Steamship terminals, *Harbor improvement, Harbor facilities, Obstructions to navigation, Penalties (Criminal).

Provision is made for the method of appointment of commissioners of steamship terminals; their length of service and the professions from which they may be chosen are stipulated. The commissioners may acquire, construct, maintain and operate such docks, wharves, piers, quays, dikes, canals, slips, basins, terminals, or other appropriate harbor facilities, and water transportation facilities in specified cities as are required to promote the in-

terchange of rail and water traffic. The commissioners consult and cooperate with the federal authorities regarding any river or harbor improvement or the construction of any bridge over navigable waters within the state. The commissioners may cause surveys to be made of navigable waters or extensions thereof, of waters that may be made navigable, or for the protection of river banks against erosion. The commissioners confer with cities concerning water terminal facilities and promote greater coordination between water and rail transportation. The commissioners are charged with conservation and development of water transportation. The commissioners may sell such lands, easements, riparian rights, and other property as may be acquired by them; the disposition of proceeds from such sales and from operations is provided for. Persons obstructing navigation in specified ways are subject to criminal penalties. (Keith-Florida)

POTOMAC RIVER COMPACT OF 1958.

Md Ann Code Art 66C sec 261 A (1957).

Descriptors: *Maryland, *Interstate compacts, *Fish management, *Fisheries, Virginia, Legislation, Regulation, Ownership of beds, Low water mark, Riparian rights, Oysters, Clams, Shellfish, Crabs, Fish conservation, Water resources development, Permits, Docks, Administrative agencies.
Identifiers: Penalties, Finfish.

The Potomac River Compact of 1958 between Virginia and Maryland is agreed to by the commissioners appointed by the respective states. The Potomac River Fisheries Commission is established. Regulations for compensation, meetings, offices, and employees are set forth. The Commission's jurisdictional boundaries are delineated. The Commission has the power to survey oyster bars within its jurisdiction. It may reseed and replant said bars. The size, type, and description of all species of finfish, crabs, oysters, clams, and other shellfish which may be taken are conservation and repletion of fishery resources. Licenses may be issued for fishing and for equipment to be used within the Commission's territory. Other Commission powers and duties regarding expenditures, regulations, inspection tax, and the dredging of soft-shell clams are set forth. Regulations for procedure and review of Commission regulations are set forth. Penalties are provided for violations of these regulations. Rights of citizens of Virginia and Maryland to erect and maintain wharves and other improvements are not altered or diminished. Laws of Maryland relating to finfish, crabs, oysters, and clams in the Potomac River remain applicable except when changed by Commission regulation. (Moulder-Florida)
W70-00810

NATURAL RESOURCES (OYSTERS AND CLAMS).

Md Ann Code Art 66C secs 696, 698 thru 704, 707, 708, 709, 710, 712 thru 717 (1957), as amended, (Supp 1968).

Descriptors: *Maryland, *Clams, *Oysters, *Commercial shellfish, Legislation, Regulation, Administration, Mollusks, Dredging, Fishing, Permits, Industries, Commercial fishing, Fishing gear, Conservation, Public benefits, Management, Hydraulic equipment, State jurisdiction, Legal aspects.
Identifiers: Penalties.

Regulations pertaining to the taking of oysters and clams are set forth. Basic definitions, geographical areas and other general provisions applicable to the industry are included. Provisions covering the culling of oysters, tonging, licensing fees and requirements, restricted areas, and certain exceptions are set forth. Dredging restrictions, including land area, boat and dredge size, and licensing requirements together with special provisions for dredging in county waters are provided. The Potomac River fisheries are reserved for residents of Virginia and Maryland. Oyster packers and dealers are regulated in line with legislative provisions for propagation of oyster culture, including private oyster culture. Areas to be leased, who may lease, procedures for obtaining a lease, the type of oyster that may be harvested and fees are provided. Taxing and licensing provisions relating to the oyster and clam industry are provided. Soft-shell clam regulations are promulgated for specific counties. (Moulder-Florida)

SHOREFRONT PARK IMPROVEMENT ASSOCIATION, INC V KING (RIPARIAN RIGHTS AND RESTRICTIONS ON THE RIPARIAN LAND).

253 A2d 29-34 (Conn 1968).

Descriptors: *Connecticut, *Riparian rights, *High water mark, *Low water mark, Legal aspects, Judicial decisions, Marinas, Navigable waters, Water law, Boundaries (Property), Piers, Leases, Docks, Riparian land, Ownership of beds, Competing uses, Recreation, Relative rights, Riparian waters.
Identifiers: *Restrictive covenants, *Subdivisions, *Intent, Yacht clubs, Reciprocal rights, Moorings, Injunctions (Prohibitory).

Plaintiffs are homeowners in a subdivision in which lots are sold with restrictive covenants in the deeds; the restrictive covenants are of a type commonly used to keep an area residential in nature. Defendant corporation leased several lots within the subdivision for use as a yacht club and marina. The Superior Court granted plaintiff's plea for injunctive relief and the defendant appealed. The Supreme Court first found that the proposed use of lots within the subdivision for business purposes would be in direct violation of the covenants. The Supreme Court then noted that the title to land between high and low water marks is in the state; this being the case, such rights as the defendant has to build docks and piers below the high water mark are riparian rights which have their source in the property ownership of the land above the high water mark. It follows that defendant's riparian rights are subject to the restrictive covenants; the decision of the Superior Court was affirmed. (Keith-Florida)

PIERCE V RILEY (UNREASONABLE EXTENSION OF RIPARIAN RIGHTS).

168 NW2d 309-311 (Ct App Mich 1969).

Descriptors: *Michigan, *Riparian rights, *Easements, Right-of-way, Riparian land, Access routes, Lakes, Lake shores, Non-consumptive use, Recreation, Water rights, Legal aspects, Judicial decisions, Remedies, Water utilization.
Identifiers: Injunctions (Prohibitory).

Plaintiffs, riparian property owners, filed suit for a declaration of rights and to enjoin defendant real estate developers from granting easements of right-of-way to non-riparian lot owners. Defendants owned 91 lots, one of which fronted on the lake. Defendants proposed to sell the lots and provide all lot owners with access to the lake by granting easements of right-of-way across their lake front lot. Plaintiffs contended that this would constitute an extension of use and riparian rights that would result in an unreasonable burden on other riparian owners. After a hearing, the trial court found in favor of defendants, and plaintiffs appealed. The appellate court found that an injunction was a proper method through which plaintiffs could seek to protect their property rights. The court remanded the case for reconsideration of the reasonableness of the use in light of the factors set forth in Thompson v Enz, 154, NW2d 473, with both parties being given the right to present additional evidence as to the reasonableness of the factors not pleaded. PUBLIC UTILITIES (PUBLIC WATER DISTRICTS).

Ill Ann Stat ch 111 2/3, secs 188-212.10 (Smith-Hurd 1966), as amended, (Supp 1969).

Descriptors: *Illinois, *Water districts, *Water works, *Public benefits, Legislation, Administration, Regulation, Utilities, Water distribution (Applied), Water rates, Water supply, Public health, Public utility districts, Sewage treatment, Sanitary engineering, Rates, Financing, Capital, Operation and maintenance, Condemnation, Administrative agencies.

The creation of public water districts by election is authorized. Such water districts are managed by a board of seven trustees which act as the corporate authority of the district. Attorneys and engineers may be appointed. Land condemnation proceedings are authorized. The districts are authorized to construct, maintain, and extend water mains where necessary. The districts may contract to supply water outside the district. The boards of trustees may maintain, operate, and improve water works properties within districts in which the boards consider such action conducive to public health. The boards establish rates and charges. Revenue bonds may be issued. The districts may construct water works within villages or towns not owning or operating water works systems. The districts have the power to acquire, maintain, and operate sewerage properties and may issue revenue bonds for this purpose. Contiguous territory may be annexed by the water districts. Procedures are outlined for the annexation and dissolution of districts. (Moulder-Florida)

The board of levee commissioners shall superintend the construction, care, and protection of the levee. They may enter upon, acquire, take and hold

any lands necessary and proper for locating, constructing, enlarging, and maintaining the levee. In order to carry out their duties, the board may: (1) enter into agreements with any commission or agency of the federal government; (2) levy and collect an annual tax on property within the territory protected by the levee; (3) borrow needed funds and issue, negotiate and sell bonds for this purpose; and (4) make additional assessments under drainage law procedure to meet needed expenses. A lien for the costs of the levee shall exist against all land within the territory protected by the levee. When it will be conducive to the public welfare or benefit, any county court may establish and aid in the construction of any levee within the county. Provisions for fining violators of the provisions of this chapter are outlined. (Schram-Florida)

OPERATIONAL PROCEDURES FOR EVALUATING FLOOD PROTECTION BENEFITS,
Department of Agriculture, Washington, D.C.; and North Carolina State Univ., Raleigh.
R. A. Freund, and G. S. Tolley.
IN Economics and Public Policy in Water Resource Development, Ames, Iowa State University Press, p 150-170, 1964. 21 p, 1 fig, 9 tab, 4 ref. Edited by S. C. Smith, and E. N. Castle.

Descriptors: *Watersheds, *Economic analysis, *Economic evaluation, Planning, Floodwater, Benefits, Floodplain, Coastal plains, Income, Costs, Measurement, Crops, Streams, Hydrology, Data collection.
Identifiers: *Workplan, Tobacco, Cropland.

This article deals with a project write-up which presents alternative lines of development in floodplain agriculture. It is oriented to small watershed projects, since planning for these is similar to planning for larger projects, and is thus relevant to other water resource programs. As a result, a case can be made for adoption as a package of the modified workplan and a shortened evaluation method in watershed projects. The workplan calls for expanded economic content which recognizes that benefits cannot be predicted with certainty, and describes the alternative possible outcomes. The shortened evaluation method presents a less refined method of application which frees the economist for more extended work on the workplan. This plan enables economists to remain cognizant of trends affecting regional agriculture and the watershed planning. (Murphy-Rutgers)

FLOOD CONTROL POLICY AND FLOOD MANAGEMENT,
William Whipple, Jr.
New Jersey Water Resources Research Institute Report, Rutgers University, New Brunswick, New Jersey. Paper presented at Interstate Conference on Water Problems, Oct 17-18, 1968. 14 p.

Descriptors: *Flood control, *Flood plain management, *Non-structural alternative, *Flood plain insurance, *Flood plain zoning, Flood protection, Flood damage.
Identifiers: *Project-induced economic growth, Flood plain encroachment.

Total annual flood damages are increasing, due to encroachment upon flood plains. Reservoir flood control if often illusory, as project-induced growth recreates flood hazards. The Federal Flood Insurance Act of 1968 was advocated to control flood plain occupancy; but since it is both voluntary and subsidized it may actually increase flood plain occupancy. This flood insurance is essentially a financial palliative rather than a non-structural alternative. Zoning remains the essential alternative to structural flood control. Flood insurance may provide an incentive to zoning by the states if properly administered.

AN ENVIRONMENT FIT FOR PEOPLE,
Raymond F. Dasmann.
New York Public Affairs Committee, 1968. 28 p.

Descriptors: *Environment, *Conservation, Technology, Population, Wildlife, Ecology, Environment, Cities, Air pollution, Water pollution, Solid wastes, City planning, Soil erosion.
Identifiers: Urban space, Rural lands, Rangelands, Forest conservation, Marine environment.

We have made spectacular gains in our method for producing the needs and luxuries of life. But technological advances are being bought at the cost of increasing deterioration of the environment, pollution of air and water, crowding and congestion, loss of living space and destruction of natural environments. There is worry that even if man's material needs can be satisfied, the world he lives in will be less suited to maintaining those human qualities that make men fit company for one another. A concern for keeping the world a fit place for people is the basis for the social movement known as conservation. Like the environment, the meaning of conservation has been changing. The conservationist was once involved mostly with the natural world and the rural scene. Today the conservationist is also concerned with the concentration of population in towns and cities, the dangers of pollution, the population explosion, etc. Many of these areas of interest, such as in water pollution, have economic ramifications which must be considered by the conservationist. (Loeb-Rutgers)

NATURAL RESOURCES: QUALITY AND QUANTITY.

California, Berkeley and Los Angeles, University of California Press, 1967. 217 p. Edited by Ciriacy-Wantrup, S. V. and Parsons, James J.

Descriptors: *Natural resources, Quality control, Water quality, Value, Management, Land, Burning, Mineralogy, Public health, Air pollution, Wildlife management, Ecosystems, Administration, Planning.
Identifiers: *Quality, *Quantity, Interdisciplinary areas, Identification, Social systems, Air quality management, Public policy.

The essays composing this volume were first presented before an interdisciplinary faculty seminar at the University of California, Berkeley. The seminar was sponsored by the Chancellor's Committee on Natural Resources. The main concerns of the Committee were the effects of specialization and of an academic structure based on disciplines upon the advancement of interdisciplinary areas of study. The seminar was also to explore the possibilities for organizing interdisciplinary research on natural resources into an Institute of Natural Resources. The central theme of this volume concerns the problems of environmental quality and the relations between quality and quantity in the natural resources area. The three essays of Part I deal with the issue of identification. The difficulties of identifying the dimensions of quality are of a different order of magnitude from those involved in identifying the dimensions of quality are of a different order of magnitude from those involved in identifying the dimensions of water quality. The difference is that evaluation is involved. The seven essays of Part II are concerned with the type of quality dimensions illustrated by water quality. The essays of Part III deal with complex biological-social systems dominated by the two great evolutionary forces of mutation and selection. (See also W70-00606 thru W70-00612). (Loeb-Rutgers)

QUALITY IN THE CONTROL OF QUANTITY,
California Univ., Berkeley.
Lewis Mumford.
Natural Resources: Quality and Quantity, p 7-18, University of California Press, Berkeley and Los Angeles, 1967. 12 p.

Descriptors: Technology.
Identifiers: *Quality, *Quantity, Technological innovation, Science, Workmanship, Standardization, Mass production, Quantification.

The author contends that the problem of our age, which dominates or underlies most of its other problems is the problem of quality. The evidence increasingly shows that many technological innovations that have been regarded as indications of progress have actually been regressive in their effects, in that they have favored mechanical processes at the expense of human functions and human purposes. The author exposes the ideological misconceptions that have impelled us to promote the quantative expansion of knowledge, power and productivity, without inventing any adequate system of controls. The author further proposes to show that the deliberate disregard of qualities in the conceptual scheme of seventeenth century science has removed the complex, built-in controls which, though sometimes clumsy, had hitherto been effective. The idea might be useful in the water area in studies pertaining to water pollution and the quality of outdoor recreation associated with water resources. (See W70-00605). (Loeb-Rutgers)
W70-00606

RESOURCE QUALITY AND VALUE OF THE LANDSCAPE,
California Univ., Berkeley.
D. B. Luten.
Natural Resources: Quality and Quantity, p 19-34, University of California Press, Berkeley and Los Angeles, 1967. 16 p, 4 fig.

Descriptors: *Value, Natural resources, Water quality, Water management, Systematics, Boundaries, Ecosystems.
Identifiers: *Resource quality, *Landscape wilderness.

When we speak of the 'quality' of a natural resource at least two aspects may come to mind. The first is well symbolized by water. The 'quality' of water is often an issue in the management of water, but it can usually be measured in terms of the quantity of impurities. While the qualitative epithets 'good' or 'bad' may be applied to it, they always lead to the queries, 'How good,' 'How bad,' and these answers must be made in quantitative terms. In sharp contrast to this is the second aspect which compares the quality of a particular good relative to another. Two topics are examined in this essay. The first pertains to the divisions and boundaries within a discipline. Discipline divisions are usually separated by boundaries which indicate qualitative changes. For example, we might be interested in the division or border between soft and hard water, or between water of different degrees of purity. The final discussion in this article is an argument to justify the landscape itself especially the wilderness landscape, as a natural resource. The author contends that the wilderness is perhaps the most important of all resources, both in quality and quantity, because it is essential for the long-range welfare of men. Many economic studies in the water area are involved with the preservation of these natural resources and the improvement of the quality of them as well. (See W70-00605). (Loeb-Rutgers)
W70-00607

PROBLEMS OF QUALITY AND QUANTITY IN THE MANAGEMENT OF THE LIVING RESOURCES OF THE SEA,
California Univ., San Diego, La Jolla.
Milner B. Schaefer.
Natural Resources: Quality and Quantity, p 87-101, University of California Press, Berkeley and Los Angeles, 1967. 15 p, 3 fig, 11 ref.

Descriptors: *Water resources, *Foods, *Recreation, Sea water, Prices, Fisheries, California, Planning.
Identifiers: International considerations, Management problems, Marine resources, Quantity, Quality.

The primary use of the living resources of the sea is for protein food for direct human consumption. However, particularly important in the United States, and especially in California, is the use of the living resources of the sea for recreation. The pursuit of game fish species, such as tunas, marlin, yellowtail, bonito, flounders, and shore fish is enjoyed by large numbers of our citizens. A not negligible use of the sea's living resources is for the utility people derive from observing the larger animals in their natural habitat. A crude measurement of the quantity of the harvest of the sea is provided by the weight of the landed catch. The measurement of quality is a great deal more difficult, since quality depends not only on the inherent properties of an object but also on the attitude of the user. For organisms harvested commercially for human food, price is probably the most useful comparative measure of quality. Recreational uses depend very greatly on quality, but the quality of a recreational resource is difficult to measure. The author states, therefore, that it is probably useless to attempt to categorize the recreational resources with respect to quality. The article further discusses international considerations in the management of the living resources of the sea as well as the growth and potential of the world's fisheries, management problems and techniques and a marine resources planning study. (See W70-00605). (Loeb-Rutgers)
W70-00608

THE ECOSYSTEM AS A CONCEPTUAL TOOL IN THE MANAGEMENT OF NATURAL RESOURCES,
California Univ., Berkeley.
Arnold M. Schultz.
Natural Resources: Quality and Quantity, p 139-161, University of California Press, Berkeley and Los Angeles, 1967. 23 p.

Descriptors: *Ecosystems, *Natural resources, Ecology, Economics, Environment, Population, Organizations, Trophic level, Energy, Entropy, Stability, Land management.
Identifiers: *Resource management, Integrative levels, Mineral cycling, Steady state, Diversity, Capacity, Homeostasis, Park management.

Despite their connate derivation, ecology and economics are usually thought of as having little in common. One reason for this is the equivocal role assigned to man by ecologists compared with the assignment made by economists. The term 'natural' implies that there is no effective disturbance by man. Man excludes himself from nature, as he chooses. When his positive relations to the environment are stressed, the specialized term 'human ecology' is employed. In contrast, the term 'resource' carries the implication of a planning agent, a manager with a goal. Here man, individually or as

one of his social groupings, appraises the usefulness of his environment; in this role he makes decisions on whether or not and how to make effective disturbances in nature. A useful concept, recently developed, reaffirms the close connections between the two eco-sciences. This concept is called the ecosystem--a functional unit conveniently organized to study the general activities of production, distribution, exchange, and consumption. It might easily be applied to the water area since in this area man is virtually concerned with his positive relation to the environment so as to effect the production, distribution, exchange and consumption of various attributes of this sector. The main objective of the author is to show that it is logical to consider the manageable unit of human, cultural, and natural resources as an ecosystem. There are two secondary objectives. One is to straighten out the sometimes bewildering distinction between ecosystem and community. The other is to make a case for ecosystem study as a separate science. The important economic and ecological role of water makes this article relevant to the water researcher. (See W70-00605). (Loeb-Rutgers)
W70-00609

THE QUEST FOR QUALITY IN THE ADMINISTRATION OF RESOURCES,
California Univ., Berkeley.
Albert Lepawsky.
Natural Resources: Quality and Quantity, p 162-175, University of California Press, Berkeley and Los Angeles, 1967. 14 p.

Descriptors: *Administration, Mathematical studies, Natural resources, Benefits, Costs, Conservation, Cost-benefit analysis.
Identifiers: *Resources quality, *Quantification, Quantity, Quality, Policy formulation.

In the analysis and administration of natural resources, there is a tendency to counterpoise the attributes of quantity to those of quality. Some resource economists have even hypothesized an inverse relation between quantity and quality. Other resource scientists and most resource conservationists actually decry this sort of mathematical syndrome in modern mass society. They argue that the overemphasis upon quantity and quantification subordinates and depreciates the quality and character of resources and resource uses and deflects from the quest for values and standards. The growing concern for quality in the administration of natural resources arises in part from the new role of unconventional resources such as recreational amenities or space, where standards of measurement and criteria of evaluation lack precision. The search for quality is also a consequence of the sheer pressure upon resources of human numbers and needs, to a point where existing ways of living are either threatened or actually being qualitatively transformed. The paper discusses the potentialities of quantitative techniques as applied to resource administration and policy formulation. Such possible potentialities would be of value in the water area. (See W70-00605). (Loeb-Rutgers)
W70-00610

ON SOME MEANINGS OF 'PLANNING',
California Univ., Berkeley.
William Peterson.
Natural Resources: Quality and Quantity, p 176-196, University of California Press, Berkeley and Los Angeles, 1967. 21 p.

Descriptors: *Planning, Economics.
Identifiers: Five-year plan, Deductive planning, Marx, Engels, Socialism, Capitalism, Utopian planning, Inductive planning.

More and more of the social processes of the twentieth-century world are 'planned.' Five-year plans, once restricted to the Soviet Union, have spread not only to other Communist states but to such diverse countries as India and Brazil. In the United States the whole social-economic structure was altered by the government's response to the depression of the 1930's and to World War II. City planners have extended their purview to regions and then, through local, national, or international agencies, to the whole physical-social environment of human life. Planning has also extended its reach into the water area and the importance of water resources to planned development, particularly on a regional level, makes this article of interest to the water researcher. (See W70-00605). (Loeb-Rutgers)
W70-00611

PRESSURES OF GROWTH UPON ENVIRONMENT,
Washington Univ., St. Louis, Mo.
Harold J. Barnett.
Environmental Quality in a Growing Economy, Baltimore, Johns Hopkins Press, p 15-20, 1966. 6 p, 2 ref. Edited by H. Jarrett,

Descriptors: *Growth rates, *Environment, *Ecology, *Market value, *Decision making, Population, Shrinkage, Climates, Land, Income, Market value, Rent, Floods, Erosion, Landscaping, Value, Natural resources.
Identifiers: *Econosphere, *Congestion, *Economic history, Society, System, Synthetics, Laissez-faire, Free enterprise, Yield, Benefit-cost measurement.

This article proposes that a great increase in the size of the human ecology system will bring differences in both the nature and character of that system. At times when these tendencies have appeared, there has been a growth in perception of and discomfort from environmental congestion and damage, at which point the whole populace appears to want better quality in its environment. In the economic theory of a free enterprise economy, there is no necessary reason why due process appropriation of economic rent or land titles should interfere with classical economic efficiency nor why democratic decisions to place boundaries and rules on land use might not improve economic welfare. This article suggests that Presidential and Administration decisions to improve the quality of the environment are imminent and economic analysis should play a major role in determining the composition of these expenditures. Since water resources are a vital part of the changing environment, this article is of interest to the water resource planner. (Murphy-Rutgers)

THE SONORAN DESERT; ITS GEOGRAPHY, ECONOMY, AND PEOPLE,
Roger Dunbier.
University of Arizona Press, Tucson, 1968. 426 p.

Descriptors: *Water resources development, *Economy, *Social aspects, Deserts, Arid lands, Mexico, Southwest U.S., Arizona, Vegetation, Soils, Climates, History, Colorado River Basin.
Identifiers: *Sonoran Desert, Sonora, Salt River Valley (Ariz).

A regional geography that treats the economic development of the Sonoran Desert of North America. Chapters include; The Desert and Desert Landforms, Climate, Soils, Vegetation, Water, Social Evolution, The Mission Period, Westward Crossings, Water Resource Development, The Native Economy, The Mexican Economy, The American Economy, Political Factors, and A Pattern of Settlement. The water chapter reviews natural occurring waters. Areas of internal drainage and desert streams are treated along with floods and groundwater. Streams that originate outside the desert are considered by geographical subunits. The various aspects of water resources development in this area are treated under the general heading of Development of Groundwater, Lower Colorado Valley, Salt River Valley, Other Arizona Districts, and Development of Water Resources in Mexico. The overriding importance of water in the social, cultural and economic development of this desert is emphasized throughout. (Sherbrooke-Arizona)

SOME METEOROLOGICAL REQUIREMENTS IN WATERSHED ENGINEERING RESEARCH,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
David M. Hershfield.
Proc 3rd Annu Amer Water Resources Conf, Nov 8-10, 1967, San Francisco, Calif, p 485-492, 1967. 8 p, 4 fig, 4 ref.

Descriptors: *Meteorological data, *Surveys, *Network design, Data collections, Watershed management, Rainfall, Runoff, Rainfall-runoff relationships, Duration curves, Depth-area curves, Depth-area-duration analysis, Distribution patterns, Rainfall disposition, Evapotranspiration.
Identifiers: Watershed engineering, Data requirements.

The major meteorological needs in the hydrologic phase of watershed engineering are for good estimates of various characteristics of precipitation and evapotranspiration. For precipitation this includes storm volume, depth-area relationship, time distribution, and the storm progression pattern. Only the first of these characteristics can be reliably estimated in well-instrumented research watersheds in most parts of the country. Similarly, estimates of several characteristics of evapotranspiration are required, foremost of which is areal estimates for short durations of time. This is one of the major problem areas in watershed research. (Knapp-USGS)

RADAR-COMPUTED RAINFALL COMPARED WITH OBSERVATIONS FROM A DENSE NETWORK OF RAIN GAUGES,
Environmental Technical Applications Center (Air Force), Washington, D.C.
Martin Ross.
USAF, Air Weather Service, ETAC Technical Note 69-4 June 1969. 11 p, 1 tab, 3 fig, 3 ref. Available from the Clearinghouse as USAF ETAC TN 69-4, $3.00 in paper copy, $0.65 in microfiche. AD-688 434.

Descriptors: *Radar-computed rainfall, *Rainfall intensity, Rainfall.
Identifiers: Precipitation.

Using Wilson's Rainfall Rate - Echo Intensity (RR-EI) chart, based on the average relationship, radar data collected for 36 hours, using the US Weather Bureau's WSR-57 at Atlantic City, New Jersey, are compared with rainfall data from three tipping-bucket rain gauges. These tipping-bucket gauges are located within 60 nm of the radar and cover a 4.8 square-mile area. Comparisons between the radar and tipping-bucket gauges are shown. Radar measurements were within 2% of the total rain gauge average. The correlation coefficient was .91. Use of the US Weather Bureau's RR-EI chart would have underestimated the average areal precipitation. Hourly rainfall amounts of 0.01 inches were detected in 80% of the cases. Hourly amounts of 0.02 inches or more were detected in 100% of the cases.

Available from Clearinghouse as AD-686 487 for $3 in paper copy, 65 cents in microfiche. Final Rep of Univ Museum, Penn Univ, Nov 1968. 130 p, 32 fig. ONR Contract N00014-67A-0216-0002.

Descriptors: *Remote sensing, *Underwater, *Oceanography, *Mapping, *Instrumentation, Surveys, Data collections, Reviews, Photography, Submarines, Photogrammetry.
Identifiers: Sonar mapping.

The capabilities of two side looking sonar systems were evaluated in waters ranging from 250 to 350 ft. Detected targets were visually examined using underwater television and the ASHERAH submersible. Two ancient shipwrecks were discovered as a result. A stereophotogrammetric mapping system was designed, and tested on the ASHERAH. It was demonstrated that it is possible to map extended areas of the ocean's floor using overlap stereophotography without the need for surveyed ground control data. Various photographic techniques, submersible handling and logistic problems, and underwater viewing systems including viewpoint optics are also discussed. (Knapp-USGS)
W70-00461

AN EXPERIMENTAL IN SITU DENSITOMETER,
Massachusetts Inst. of Tech., Cambridge. Dept. of Meteorology.
Howard W. Kuenzler.
Available from Clearinghouse as AD 681 090 for $3 in paper copy, 65 cents in microfiche. Rep 68-3, Fluid Dynam Lab, Mass Inst Technol, Sept 1968. 56 p, 18 fig, 4 tab, 8 ref. ONR Contract NONR 1841 (74).

Descriptors: *Instrumentation, *Oceanography, *Water measurement, *Density, *Sea water, On-site tests, Calibrations, Electronic equipment, Measurement, Research equipment, Strain gages.
Identifiers: In situ densitometer (Water), Water density measurement.

A new prototype transducer capable of making direct measurements of fluid density in situ has been developed. The theory of design, the method of construction, and the performance in laboratory tests are discussed in view of its possible application as an oceanographic tool for precise measurement of seawater density. Present sensitivity is within an order of magnitude of the capabilities of indirect techniques currently being used for seawater. Suggestions are made for improving the precision, and indications are given that the device has potential as a sea-going oceanographic instrument. (Knapp-USGS)
W70-00462

OPTICAL OCEANOGRAPHY,
Copenhagen Univ. (Denmark). Inst. of Physical Oceanography.
N. G. Jerlov.
Amsterdam, Elsevier Publishing Co, 1968. 194 p, 83 fig, 28 tab, 294 ref.

Descriptors: *Oceanography, *Sea water, *Optical properties, Light, Refractivity, Turbidity, Dispersion, Albedo, Solar radiation, Absorption, Bioluminescence, Instrumentation, Analytical techniques, Photosynthesis, Water pollution effects, Color.
Identifiers: *Optical oceanography.

Optical oceanography is defined, discussed in detail, and existing literature on the subject is reviewed in a comprehensive monograph. The properties of sea water, including light absorption, scattering, polarization, attenuation, albedo, refraction, radiation, color, and visibility are explained. Instrumentation, techniques of study, applications of optical methods, uses of research, and biological studies are discussed. Fundamental data for the study of photosynthesis are given. These include solar radiation, transparency, effect of particles on light scattering and absorption, bioluminescence, and water pollution effects. (Knapp-USGS)

APPLICATION OF AN AIRBORNE PULSED LASER FOR NEAR SHORE BATHYMETRIC MEASUREMENTS,
Syracuse Univ. Research Corp., N.Y.
Daniel G. Hickman, and John E. Hogg.
Remote Sensing of Environ, Vol 1, No 1, p 47-58, Mar 1969. 12 p, 14 fig, 1 tab, 10 ref.

Descriptors: *Bathymetry, *Shores, *Lakes, *Measurement, *Remote sensing, *Aircraft, Lake Ontario, Water storage, Turbidity, Velocity.
Identifiers: Airborne pulsed laser, Bathymetric measurements.

Feasibility of using a pulsed blue-green laser as an airborne Bathymetric sensor for near-shore beach reconnaissance surveys was investigated by using an experimental water tank and a laser transmitter-receiver system flown over the shores of Lake Ontario. Water depths to 26 ft were recorded in the study; maximum depth capability of the laser system is limited by turbidity of the water. In fairly clear water the depth-measuring capability is about 120 ft. The shallow water resolution is 1.5 ft. An aircraft flying at 300 miles/hr could obtain data points every 20 ft over an area of 5-50 sq miles each hr. (Gabriel-USGS)

Wyoming Univ., Laramie.

Wyoming Univ Water Resources Research Institute, Water Resources Series No 15, Sept, 1969. 50 p, 1 tab, 1 fig, 3 ref, append. Paul A. Rechard, Ed.

Descriptors: *Instrumentation, *Data processing, Watersheds, *Operation and maintenance.
Identifiers: Anemometers, *Computers, Evaporation pans, Gages, Hygrothermographs, Observation wells, Precipitation gages, Pyrheliographs, Pyrometers, Soil moisture meters, Thermometers.

The instrumentation within the Snowy Range Water Resource Observatory is described. Some of the problems of operating and maintaining the instruments are discussed. Methods of portraying the data collected are presented and the ADP card format and computer program for processing hygrothermograph records is given. Resumes of single discipline research within the observatory during 1966-1969 are given, together with some conclusions as to interdisciplinary considerations.

ANNUAL REPORT FISCAL YEAR 1968-69,
William Whipple, Jr.
New Jersey Water Resources Research Institute Report, Rutgers University - The State University, New Brunswick, New Jersey, July 1969. 68 p.

Descriptors: *Research grants, *Research facilities, *Water resources development, Economics, Urbanization, Biochemical oxygen demand, Dissolved oxygen.
Identifiers: *Water resources research administration, Oxygen dynamics of streams, Instream aeration, Interdisciplinary research.

A report on research and training activities of the New Jersey Water Resources Research Institute during fiscal year 1969 under provisions of PL 88-379. Includes mainly activities at Rutgers University, with participation in some projects by Princeton University and Stevens Institute. Thirty projects active, funded mainly by Office of Water Resources Research and the Federal Water Pollution Control Administration, with matching funds from the New Jersey Department of Conservation and Economic Development. The chosen theme of the institute is metropolitan area water resources, and the two major fields of activity are: (1) Oxygen dynamics and biochemical oxygen demand of streams including instream aeration, and (2) Economics of water resources.
W70-00733

ANNUAL REPORT 1968-1969.
Hawaii Univ., Honolulu. Water Resources Research Center.

Hawaii Water Resources Research Center Report, Aug 1969. 121 p. OWRR Project A-999-HI.

Descriptors: *Hawaii, Floods, *Hydrogeology, Aquifer characteristics, *Geophysical exploration, Well logging, Groundwater tides, Groundwater recharge, *Groundwater pollution, Water color, Tracers, Estuarine pollution, Hydrologic data, Irrigation, Evapotranspiration, Water values.

Annual progress report on the research program of the University of Hawaii Water Resources Research Center: the work reported includes studies of floods in small watersheds, aspects of the geohydrology of certain areas on Oahu, Maui, and Hawaii, surface and aerial geophysical exploration for groundwater and geophysical well logging, tidal oscillations in groundwater, identification of groundwater pollution effects, the pollution of certain estuaries, the removal of color from surface water, water tracing and dating, the design of hydrologic data network, the water use of sugar cane, and the value of water for irrigating sugar cane. SELECTED WATER RESOURCES INDEX FOR WISCONSIN,
Wisconsin Univ., Madison.
P. D. Uttormark, L. J. Nunnelee, and L. C. Utter.
Available from the Clearinghouse as PB-187 312 $3.00 in paper copy, $0.65 in microfiche. Also available for $3.00 per copy from University of Wisconsin Water Resources Center, Madison, Wisconsin. Wisconsin Water Resource Center, July 1969. 222 p, key word index, author index. OWRR Project A-999-WIS.

Descriptors: *Wisconsin, *Bibliographies, *Documentation, Publications.

This index was prepared to aid those concerned with water resources in Wisconsin and is designed to answer two basic questions: (1) 'What information is available,' and (2) 'Where is this information located.' The source material for this index is limited to that found at the University of Wisconsin at Madison and only those references which pertain directly to Wisconsin are included. Although an attempt was made to be thorough in preparing this index, no doubt some references have been omitted. Without question, the compilation of a comprehensive index, pertaining to water and related resources of Wisconsin, would be of significant value as a basis for solving many of the state's water resources problems. Although this publication is not comprehensive, hopefully it will provide stimulus for additional effort. (Rohlich-Wisconsin Univ)

SELECTED WATER RESOURCES ABSTRACTS

UNIVERSITY OF ILLINOIS
MAR 19 1970
LIBRARY

VOLUME 3, NUMBER 3
FEBRUARY 1, 1970

W70-00836 -- W70-01241

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 3
FEBRUARY 1, 1970

W70-00836 -- W70-01241

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

02. WATER CYCLE

2A. General

. LABORATORY STUDY OF SURFACE RU-OFF DUE TO MOVING RAINSTORMS,
linois Univ., Urbana.
en Chie Yen, and Ven Te Chow.
ISF Grant GK-1155. Water Resources Res, Vol 5, lo 5, p 989-1006, Oct 1969. 18 p, 7 fig, 13 ref.

Descriptors: *Rainfall-runoff relationships, *Runoff forecasting, *Rainfall disposition, Hydrographs, Hydrograph analysis, Dimensional analysis, Distribution patterns, Mathematical models.
Identifiers: Moving rainstorms, Rainfall distribution.

The movement of a rainstorm determines the spatial and temporal distributions of the rainfall over a watershed and hence affects the characteristics of the flow on the watershed. In this study the importance of the movement of rainstorms on the time distribution of the surface runoff from watersheds is demonstrated through the use of a laboratory watershed experimentational system. Experiments were performed on the impervious square watershed for 2 rainfall intensities, 4 surface slopes, and 14 rainstorm velocities. Analysis of the mechanics of water flowing on watersheds is attempted to explain the influence of movement of rainstorms on the characteristics of surface runoff hydrographs. (Knapp-USGS)
W70-00839

A MODEL FOR RAINFALL ROUTING DURING INITIAL ABSTRACTION,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
. X. Dunin.
Hydrol, Vol 9, No 1, p 57-72, Sept 1969. 16 p, 5 ab, 9 ref.

Descriptors: *Rainfall-runoff relationships, *Routing, *Runoff forecasting, *Mathematical models, Model studies, Infiltration, Water storage, On-site tests, Drainage, Percolation, Simulation analysis.
Identifiers: *Rainfall routing, Australia.

More reliable estimation of runoff requires the development of a model to simulate rainfall disposition prior to runoff production on rural catchments. A mathematical model based on the moisture storage capacities of the upper and subsoil zones of a catchment was developed. Its general form was confirmed by comparison of predicted values with recorded data on initial abstraction from 4 pastoral catchments on texture-contrast soils with heavy clay subsoils at the Parwan Experimental Area, near Bacchus Marsh, Victoria, Australia. The modifications necessary for extending this model to ungaged areas are elaborated and changes in the elements of the model following pasture improvement are discussed. (Knapp-USGS)
W70-00844

EFFECT OF RAINFALL VARIABILITY ON STREAMFLOW SIMULATION,
Geological Survey, Menlo Park, Calif. Water Resources Div.
D. R. Dawdy, and J. M. Bergman.
Water Resources Res, Vol 5, No 5, p 958-966, Oct 1969. 9 p, 3 fig, 2 tab, 2 ref.

Descriptors: *Rainfall-runoff relationships, *Statistical methods, *Mathematical models, *Variability, Correlation analysis, Simulation analysis, Evaporation, Hydraulic conductivity, Soil moisture, Infiltration, Routing, Streamflow forecasting.
Identifiers: *Rainfall variability.

Three recording rain gages in a 9.7-square mile basin in southern California were used with a deterministic rainfall-runoff model to simulate flood hydrographs and peaks and to assess the effects of data errors on simulation results. Bias in the estimation of effective basin rainfall seemed to result in curve fitting parameter adjustments which compensated for the bias. The combined effects for a storm of both difference in the time distribution of rainfall at different points and spatial variability of rainfall volume over the basins limit the possible accuracy of simulation results. The use of a single rain gage on a basin with this hydrology can at best be expected to predict peak discharge with a standard error of estimate on the order of 20%. (Knapp-USGS)
W70-00850

CONTINUOUS HYDROGRAPH SYNTHESIS WITH AN API-TYPE HYDROLOGIC MODEL,
Weather Bureau, Silver Spring, Md.
Walter T. Sittner, Charles E. Schauss, and John C. Monro.
Water Resources Res, Vol 5, No 5, p 1007-1022, Oct 1969. 16 p, 12 fig, 2 tab, 1 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Streamflow forecasting, Hydrograph analysis, Synthetic hydrology, Recession curves, Unit hydrographs, Groundwater movement, Antecedent precipitation, Flood forecasting, Simulation analysis.
Identifiers: Hydrologic models, Synthetic hydrographs.

The U.S. ESSA Weather Bureau Hydrologic Research and Development laboratory has developed a complete hydrologic model utilizing an antecedent precipitation index (API) type rainfall-runoff relation to compute surface runoff. With increasing demand for continuous river forecasts as well as flood forecasts, it is necessary to have a model that will predict all components of flood as functions of observable independent parameters on a continuous basis. To formulate the model, existing and proved techniques were used where possible and new techniques developed as necessary. The model consists of 4 basic parts: a relation for computing groundwater recession, a method of computing the groundwater flow hydrograph as a function of the direct runoff hydrograph, an API-type rainfall-runoff relation, and a unit hydrograph. The rainfall-runoff relation is of the incremental type, yielding a runoff computation for each 6-hr period rather than computing the total storm runoff. This has been accomplished through the inclusion of a new parameter, retention index. Two important features of the model are the ease of adjusting parameters to observed flow and the sequential development of the 4 basic parts with a minimum of interaction. (Knapp-USGS)
W70-00860

A CONJUNCTIVE OPERATION OF A SURFACE RESERVOIR AND A GROUNDWATER AQUIFER,
Technion - Israel Inst. of Tech., Haifa.
Nathan Buras.
World Meteorol Organ Int Ass Sci Hydrol Symp, Berkeley, p 492-500, Aug 1963. 9 p, 1 fig, 2 tab, 9 ref.

Descriptors: *Dynamic Programming, *Optimization, *Aquifers, *Surface-groundwater relationships, *Decision making, Reservoir operation, Pumping, Water loss, Water demand, Water supply, Mathematical models.
Identifiers: Lake Tiberias.

A conceptual framework was developed for the problem of operating surface storage facilities in conjunction with groundwater aquifers. The problem of operating the system had two aspects (a) the operation of the reservoir (Lake Tiberias) and of the aquifer so as to minimize losses of water and (b) the supply of water to satisfy demands at minimum cost of pumping. The complex physical system was reduced to a symplified mathematical model which was cast as a problem in sequential decision making. This problem was analyzed using the method of dynamic programming and indicating the form of computational solution. The optimization criterion involved the determiniation of costs connected with the delivery of water and of penalties for not meeting demands. (Thiuri-Cornell)
W70-00906

LINEAR PROGRAMMING FOR HYDROLOGIC ANALYSES,
Michigan Univ., Ann Arbor.
Rolf A. Deininger.
Water Resources Res, Vol 5, No 5, p 1105-1109, Oct 1969. 5 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Mathematical studies, *Linear programming, *Mathematical models, Simulation analysis, Least squares method, Hydrograph analysis.
Identifiers: Hydrologic models.

The estimation of the parameters of hydrologic models often poses difficulties since nonnegativity requirements, inequalities, and other constraints limit the use of standard statistical analyses. The use of linear programming techniques to estimate the parameters based on the criteria of minimum absolute deviations and on minimum maximum deviations appears to be advantageous since well-established algorithms and computer programs exist. (Knapp-USGS)

ADAPTION OF AIR TEMPERATURE FIELD TO WATER TEMPERATURE FIELD (RUSSIAN),
N. T. Glinskiy, V. F. Baklanovskayaya, and R. D. Gasanova.
Izvestia Akad Nauk, SSSR, Fizika Atmosfery i Okeana, Vol 4, No 11, p 1214-1219, Nov 1968. 5 fig, 13 ref.

Descriptors: *Air temperature, *Water temperature, Mathematical studies, Mapping, Atmosphere, Air circulation, Water circulation, Seasonal, Turbulence, Heat exchangers, Radiation, Winds, Density, Velocity.
Identifiers: North Atlantic, Air-water temperature relations.

The relationship between air temperature and water temperature was investigated on the basis of the solution of a second order partial differential equation applied to the selected meteorological and hydrological data collected in the North Atlantic, assuming that the coefficients of turbulence of each air layer are constant. The propagation of a temperature disturbance in water and the air takes place with equal velocity, indicating that the temperature changes in an over-the-water air layer closely follow the water temperature changes. 2B. Precipitation

MEASURING RAINFALL ON FOREST CATCHMENTS,
Monash Univ., Clayton (Australia). Dept. of Mechanical Engineering.
R. J. DeLaine.
J Hydrol, Vol 9, No 1, p 103-112, Sept 1969. 10 p, 1 fig, 3 ref.

Descriptors: *Rainfall, *Rain gages, *Networks, Stemflow, Interception, Forests, Instrumentation, Runoff forecasting, Rainfall-runoff relationships.
Identifiers: Forested catchments, Rain gaging.

Some principles based on field experience are given for planning a network of rain gages to give the greatest amount of information for a given amount of effort and equipment. Several ways of measuring rainfall above and below trees are described. In forest country where gaging is difficult, or in steep open country, or for any long term project, it is better to start with a pilot survey, using about 30% to 40% of the gages. This will give an idea of the variations in rainfall over the area, and will provide useful information to position the remaining gages. (Knapp-USGS)

SEASONAL VARIATION IN RAIN GAGE CATCH,
Agricultural Research Service, Cochocton, Ohio. Soil and Water Conservation Research Div.; and Weather Bureau, Akron, Ohio. Eastern Region.
J. L. McGuinness, and Grant W. Vaughn.
Water Resources Res, Vol 5, No 5, p 1142-1146, Oct 1969. 5 p, 2 fig, 2 tab, 11 ref.

Descriptors: *Rain gages, *Lysimeters, Seasonal, Rainfall, Precipitation (Atmospheric), Calibrations, Climates, Meteorology, Interception, Ohio.
Identifiers: Rain gage catch variations.

In northern Ohio 8-inch standard rain gages consistently caught more precipitation in summer and less in winter than adjacent digital punch gages although average annual totals were almost identical. A similar seasonal pattern was found in a comparison of precipitation catch by weighing lysimeters and adjacent weighing-type recording rain gages in Ohio and in a comparison of standard and recording rain gage catch in Nebraska. Some reasons for the differences in their implications are discussed. (Knapp-USGS)

CONSTRUCTION OF A MULTILEVEL SCHEME STABLE IN RELATION TO INITIAL DATA FOR SHORT-RANGE WEATHER FORECAST (RUSSIAN),
V. M. Kadyshnikov.
Izvestia Akad Nauk, SSSR, Fizika Atmosfery i Okeana, Vol 4, No 11, p 1139-1148, Nov 1968. 3 fig, 17 ref.

Descriptors: *Weather forecasting, *Mathematical models, Temperature, Gravity, Atmospheric pressure, Atmosphere, Mathematical studies, Altitude, Mapping, Cyclones, Anticyclones.
Identifiers: Multilevel-pattern numerical weather forecasting.

By assuring quasi-static and adiabatic conditions, hydrodynamic equations are given. Atmospheric geopotentials and temperatures are a function of velocity, gravity, atmospheric pressure, and gas constant. To achieve reliable short-range weather forecasting, the atmospheric space was subdivided into n layers and certain end conditions were assumed. The application of the Taylor series and matrix techniques leads to final results which can be evaluated by solving the Laplace and Helmholtz equations. An example is given of surface pressure forecasting by means of a S-level prognostic pattern satisfying the necessary requirements. (Gabriel-USGS)
W70-01015

STATISTICAL STRUCTURE OF VERTICAL HUMIDITY PROFILES (RUSSIAN),
V. S. Komarov.
Izvestiga Akad Nauk, SSSR, Fizika Atmosfery i Okeana, Vol 4, No 11, p 1160-1168, Nov 1968. 2 tab, 14 ref.

Descriptors: *Humidity, *Atmosphere, *Mathematical models, Statistical models, Seasonal, Meteorology, Forecasting, Heat balance, Energy budget, Altitude, Temperature, Geophysics, Radiosondes.
Identifiers: *USSR.

The mean values, standard deviations, and autocorrelation functions of the vertical structure of the humidity fields at Voyeykovo Tashkent, Kzyl-Orda and Nagayevo of the USSR were evaluated on the basis of radiosonde data and the application of statistical and matrix methods. The effect of physico-geographical and seasonal factors on the autocorrelation function characteristics is briefly analyzed. (Gabriel-USGS)
W70-01016

WEATHER PATTERNS IN SOUTHERN WEST PAKISTAN,
Clark Univ., Worcester, Mass. Graduate School of Geography.
Rodman E. Snead.
Available from the Clearinghouse as AD-685 975, $3.00 in paper copy, $0.65 in microfiche. Archiv fur Meteorologie, Geophysik und Bioklimatologie, ser B, Vol 16, p 316-346, 1968. 31 p, 7 fig, 7 tab, 42 ref.

Descriptors: *Arid lands, *Meteorology, *Weather patterns, *Meteorological data, Anticyclones, Precipitation (Atmospheric), Synoptic analysis, Seasonal, Rainfall disposition, Storms, Monsoons, Convection.
Identifiers: *West Pakistan, *Subsidence (Atmospheric), Arabian Sea, Depressions (Atmospheric).

The region studied is of particular interest as a transition zone between the mediteranean type winter rainfall to the west and monsoon summer rainfall to the east. As a result Southern West Pakistan receives scanty, unreliable rainfall averaging less than 10 inches per year, resulting in a very arid land. Six main patterns of weather were identified and the reasons for their occurrence are described using a method of synoptic comparison of the characteristics associated with each weather type. The types are: subtropical anticyclone pattern, winter cyclone storms, modified monsoon pattern, and eastern depressions. The synoptic characteristics of each are presented. Located in a transition zone between these different patterns, the area receives only the dying effects of each. The author concludes that it is remarkable that any moisture reaches the area since subtropical, anticyclone air is not conducive to the upward movement and resulting condensation of moisture. (Crouse-Arizona)
W70-01197

NOCTURNAL AIR TEMPERATURE ON A FORESTED MOUNTAIN SLOPE,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
James D. Bergen.
USDA Forest Serv Res Pap RM-52, 1969. 12 p, illus.

Descriptors: *Air temperature, *Mountain forests, *Climatology, Isotherms, Microclimatology, Forestry, Nocturnal temperatures, Meteorology, Heat budget, Thermodynamics, Frost protection, Cooling.
Identifiers: *Forest temperatures.

Profiles of air temperature on a forested mountain slope show an inversion below the top of the tree canopy. The slope tends to cool with constant downslope temperature gradient in the early part of the night; gradients increase in the later hours. Plots of potential temperature indicate, for some nights, a point of almost constant temperature halfway up the hillside. This point can be identified with a center of divergence for cold air moving off the slope. The potential temperature deficit relative to the temperature at this point shows approximate similarity between vertical profiles at the different stations when the profiles are scaled by the height of the first inversion above the slope and the average potential temperature deficit below that inversion.

2C. Snow, Ice, and Frost

TOTAL ALBEDO OF GREAT LAKES ICE,
United States Lake Survey, Detroit, Mich.
S. J. Bolsenga.
Water Resources Res, Vol 5, No 5, p 1132-1133, Oct 1969. 2 p, 1 tab, 6 ref.

Descriptors: *Albedo, *Ice, *Great Lakes, *Lake ice, Slush, Climatology.
Identifiers: Brash ice, Pancake ice.

The total (0.3-3.0 micron) albedo of various types of ice common to the Great Lakes ranged from 10% for clear ice to 46% for snow ice at solar altitudes ranging from 32 to 40 degrees. Explanations are given for similarities between the albedo of pancake (31%) and slush curd ice (32%), and slush (41%) and brash ice (41%). (Knapp-USGS)

D. L. Laykhtman.
Izvestia Akad Nauk, SSSR, Fizika Atmosfery i Okeana, Vol 4, No 11, p 1220-1224, Nov 1968. 2 fig, 1 tab, 5 ref.

Descriptors: *Ice, *Drifting (Aquatic), *Wind velocity, *Mathematical models, *Mathematical studies, Velocity, Stress, Turbulent flow, Viscosity, Roughness coefficient, Roughness (Hydraulic).
Identifiers: Ice drift (Wind-driven).

The phenomenon of wind drift of ice was analytically investigated using an ice-motion equation, assuming certain limiting conditions. With the increase of the Rossby number for the upper surface of the ice, the wind coefficient is increased. If the ratio of the upper roughness to the lower roughness increases, the coefficient of roughness increases. Ice drift deviates from an isobar up to 50% in the direction of higher pressure, with the small deviation angles associated with the large Rossby numbers. (Gabriel-USGS)

AN EMPIRICAL METHOD FOR ESTIMATING MONTHLY POTENTIAL EVAPOTRANSPIRATION IN NEVADA,
Agricultural Research Service, Fresno, Calif. Soil and Water Conservation Research Div.; and Nevada Univ., Reno. Desert Research Inst.
Jerold J. Behnke, and George B. Maxey.
J Hydrol, Vol 8, No 4, p 418-430, Aug 1969. 13 p, 4 fig, 3 tab, 11 ref.

Descriptors: *Evaporation, *Nevada, Arid lands, Lysimeters, Estimating, Evaporation pans, Climates, Topography, Weather, Solar radiation, Evapotranspiration.
Identifiers: Thornthwaite evapotranspiration.

Monthly potential evapotranspiration values were obtained for several stations throughout the State of Nevada using the Thornthwaite and Olivier equations. The Olivier equation correlated well with lysimeter and adjusted pan data as an estimate of ET. On an annual basis the Thornthwaite equation was approximately 50% too low. A technique was developed to estimate wet bulb depression from temperature data. This made it possible to solve the Olivier equation using only temperature data as imput. Climatic conditions in Nevada were such that it was possible to apply the dry adiabatic lapse rate to a centrally located base station to obtain temperature values for other locations lacking climatic data. On a monthly basis, this 'modified' Olivier equation correlated satisfactorily with the original equation for Nevada locations ranging in elevation from 2171 to 5136 ft and in latitude from 36 deg to 41 deg N. AN ESTIMATION OF WIND EFFECTS ON DISPERSION IN WIDE CHANNELS,
Hydronautics, Inc., Laurel, Md.
Jin Wu.
Water Resources Res, Vol 5, No 5, p 1097-1104, Oct 1969. 7 p, 5 fig, 1 tab, 9 ref. OWRR Proj C-1290.

Descriptors: *Dispersion, *Winds, *Open channel flow, *Mixing, Waste dilution, Turbulence, Diffusion, Steady flow, Convection.
Identifiers: Turbulent shear flow.

The longitudinal dispersion coefficient in a wide channel is calculated under various combinations of streamflow and wind conditions. The effect of wind, which produces drift currents in the stream, on dispersion has hitherto been neglected. The results obtained, especially the difference in dispersion coefficients obtained under upstream and downstream wind conditions, may partially explain the wide scatter of field data. This difference further indicates the importance of choosing the ejection site on the basis of the prevailing wind conditions and of considering environmental conditions beyond stream factors alone. NATURAL FEATURES CAUSED BY A CATASTROPHIC STORM IN NELSON AND AMHERST COUNTIES, VIRGINIA,.
Department of Conservation and Economic Development, Richmond, Va. Div. of Mineral Resources.

Virginia Minerals, Spec Issue, Oct 1969. 19 p, 28 fig, 1 map, 3 ref.

Descriptors: *Storms, *Virginia, *Appalachian Mountain Region, *Hurricanes, *Damages, Erosion, Floods, Landslides, Disasters, Storm runoff, Rain.
Identifiers: Hurricane Camille (1969).

Torrential rains associated with hurricane Camille dumped up to 27 inches of water during the night of Aug. 19-20, 1969 on portions of Nelson, Amherst, and adjoining counties, Virginia. The severe storm centered in the headwaters of the Tye and Rockfish Rivers and their tributaries. Abnormal amounts of rainfall have been reported from the Clifton Forge area in the western portion of the State, eastward. Considerable rain fell on the western slope of the Blue Ridge in the South River watershed. All the above mentioned streams are in the James River basin, and the flood damage extended through Richmond, eastward. Massive landslides of the debris-avalanche type moved soil, boulders, and trees to create chutes and channels that extend from the foot of the steep mountainous slopes to the mountain crests. Alluvial, rubble, and debris fans were formed, and extreme high water occurred in the lower reaches of the valleys to cause extensive property damage and loss of life. Dr. John T. Hack, U.S. Geological Survey, concluded that severe rainstorms are recurring

phenomena and are an important factor in the erosion and formation of the central Appalachian mountain landscape. (Knapp-USGS)

MEASUREMENT OF COLUMBIA RIVER FLOW TIME FROM HANFORD REACTORS TO ASTORIA, OREGON-SUMMER 1966,
Oregon State Univ., Corvallis.
Peter J. Hanson, and William O. Forster.
Water Resources Res, Vol 5, No 5, p 1129-1131, Oct 1969. 3 p, 1 fig, 6 ref.

Descriptors: *Streamflow, *Tracers, *Columbia River, *Tracking techniques, Chromium, Discharge (Water), Path of pollutants, Radioactive wastes, Waste dilution, Sampling.
Identifiers: Chromium radioisotopes, Water-mass tracers.

Chromium-51 induced in the Hanford production reactors was used to measure Columbia River flow times between the reactors and Astoria, Oregon. This opportunity came during the summer of 1966 when all reactors were inoperative for the first time in 22 yr. Chromium-51, introduced into the river as chromate anion tends to remain in solution, thus providing a suitable water-mass tracer. The complex inverse relationship of flow time to volume discharge is seen in our values of 12 days flow time from the reactors to Astoria, Oregon, during an average discharge of 290,000 cfs and 19 days flow time at a low volume discharge of 13,000 cfs. Such short travel time could be critical in the event of an accidental release into the river of extremely hazardous levels of radioactivity. (Knapp-USGS)
W70-01002

SPATIALLY VARIED FLOW EQUATIONS,
Illinois Univ., Urbana.
Ven Te Chow.
Water Resources Res, Vol 5, No 5, p 1124-1128, Oct 1969. 5 p, 5 ref.

Descriptors: *Overland flow, *Mathematical studies, Steady flow, Unsteady flow, Discharge (Water), Mathematical models, Open channel flow, Equations, Hydrodynamics.
Identifiers: Spatially varied overland flow.

The momentum and energy principles are equally applicable in the derivation of spatially varied flow equations. By applying the energy principle and introducing a slope of given energy head, the resulting spatially varied flow equation takes a different form of several terms containing the slope and the effect of added or extracted discharge from the equation derived by applying the momentum principle and using the frictional slope. The two slopes, however, become identical if the flow is steady. The spatially varied flow equation is the same for flow with either increasing or decreasing discharge. (Knapp-USGS)

Identifiers: *Flood frequency, Flood hydrology, *Drought frequency curves, Australia.

Probability analysis of floods and droughts is of uncertain usefulness because of the unpredictability of sample errors and scarcity of field data. However, probability studies provide a valuable addition to hydrologic assessments and should be used whenever possible. A method is presented for statistical analysis of floods and droughts for rivers having reasonably long streamflow records. Results of these analyses can be applied to ungaged streams for flood frequency predictions. Flood probability predictions on ungaged catchment areas must be used with extreme caution because parameters identifying the similarity of catchment areas are difficult if not impossible to define. If used with caution, the method can provide valuable results and allow preliminary hydrologic estimates for feasibility studies of proposed dams. Drought analyses give additional data for storage behavior, assessing desirability of constructing a reservoir, issuing stream pumping licenses, and indicating low flow periods for construction purposes. GROUNDWATER MOVEMENT TOWARD ARTIFICIAL CUTS,
North Carolina State Univ., Raleigh.
Abdel-Aziz I. Kashef.
Water Resources Res, Vol 5, No 5, p 1032-1040, Oct 1969. 9 p, 3 fig, 2 tab, 11 ref.

Descriptors: *Groundwater movement, *Saturated flow, *Steady flow, *Excavation, Drainage, Water table, Water levels, Aquifers, Hydraulic conductivity, Aquicludes, Seepage, Inflow.
Identifiers: Drainage to excavations.

Artificial cuts, such as open channels and highway cuts, produce an imbalance in the original groundwater system. The developed drawdowns due to these cuts under the condition of saturated steady flow are studied theoretically by analyzing the seepage through trapezoidal sections of earth entailing the complexity of the free surface. The procedure is then extended to actual cases of extensive aquifers where such cuts exist. The proposed method is compared with some of the available rigorous mathematical solutions, such as those given by Falkovich, Mikhailov, Meletchenko, Pavlovsky, and Polubarinova-Kochina. The proposed method is simpler in its application and also gives a complete solution for the free surface, the discharge face, the rate of flow, and the hydropotential distribution within the affected region, whereas the rigorous methods are planned essentially for the solution of the free surface only. DETERMINING AQUIFER CHARACTERISTICS BY THE TIDAL METHOD,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
P. A. Carr, and G. S. Van Der Kamp.
Water Resources Res, Vol 5, p 1023-1031, Oct 1969. 9 p, 2 fig, 3 tab, 7 ref.

Descriptors: *Transmissivity, *Permeability, *Aquifers, *Tidal effects, Aquicludes, Water storage, Hydraulic conductivity, Artesian wells, Water level fluctuations, Hydrogeology.
Identifiers: Aquifer testing, Tidal efficiency, Prince Edward Island (Canada).

If groundwater levels of a confined aquifer fluctuate with sea tides, individual values of hydraulic conductivity and specific storage can then be determined. Apparent tidal efficiency and time lag are first calculated from the water level data recorded at an observational device situated inland from the sea, taking into account the response characteristics of the observational device. The true tidal efficiency of the aquifer at the seacoast is then determined from the apparent tidal efficiency and used to obtain the specific storage. This and the tidal time lag are utilized to calculate the hydraulic conductivity. The method was tested in Prince Edward Island, Canada, and yielded results compatible with pump test data. This is a simple and inexpensive way to test a confined aquifer in the coastal environment. (Knapp-USGS)

LAND SUBSIDENCE DUE TO GROUNDWATER WITHDRAWAL, TULARE-WASCO AREA, CALIFORNIA,
Geological Survey, Washington, D.C.
B. E. Lofgren, and R. L. Klausing.
Geol Surv Prof Pap 437-B, p B1-B101, 1969. 101 p, 69 fig, 15 tab, 54 ref.

Descriptors: *Subsidence, *Compaction, *Water level fluctuations, *Withdrawal, *California, Groundwater, Water yield, Water wells, Geology, Hydrogeology, Instrumentation, Surveys.
Identifiers: Tulare-Wasco area (Calif).

Intensive pumping of groundwater has caused more than 800 sq mi of irrigable land to subside in the Tulare-Wasco area, San Joaquin Valley, Calif. Locally, groundwater levels declined as much as 200 ft between 1905 and 1964, and the maximum subsidence was about 12 ft by 1964. Subsidence was due to the compaction of the water-yielding deposits as the intergranular effective stresses increased. The magnitude and rate of subsidence are directly related to (1) the change in effective stress within the various compacting beds that results from water-level changes and (2) the thickness and compressibility of the compacting deposits. The compressibility of the deposits can be approximated either by testing selected cored samples in the laboratory or by measuring in the field the compaction that results from a given change in effective stress in a subsiding area. The annual rate of subsidence varies greatly in direct response to seasonal pumping. This rate varied from an average of about 136,000 acre-ft per year from 1948 to 1954, to 45,000 acre-ft per year from 1957 to 1959, and to 173,000 acre-ft per year from 1959 to 1962. During the 13 years from 1950 to 1962, the volume of subsidence (1.40 million acre-ft) was roughly 10% of the total groundwater pumpage (13.5 million acre-ft). (Knapp-USGS)

TIME VARIANT GROUND WATER FLOW BY RESISTANCE NETWORK ANALOGUES,
Birmingham Univ. (England). Dept. of Civil Engineering.
Robin Herbert.
J Hydrol, Vol 6, No 3, p 237-264, 1968. 28 p, 17 fig, 2 tab, 12 ref.

Descriptors: *Groundwater movement, *Model studies, *Analytical techniques, Water table, Analog models, Steady flow, Storage capacity, Permeability, Dewatering, Drawdown, Hydrologic properties, Flow nets.
Identifiers: *Unconfined flow, Network analogs, Time variant flow, Inertia forces.

A technique is presented for studying time variant unconfined groundwater flow using resistance network analogs. Development of the technique is described first and then it is tested against three analytical solutions to aquifer systems of two dimensional, radial, and three dimensional forms. Testing shows the technique to be accurate and it can be extended to represent any geometric flow net. The method can be used to study three dimensional groundwater flow such as determination of the principles on which to design multi-well dewatering systems. Water-table movement and steady state conditions are shown graphically. Demonstration problems and a comparison of water-table profiles are also graphed. (Lang-USGS)

GENERAL SYSTEMS APPROACH TO GROUND-WATER PROBLEMS,
Arizona, Tucson.
Lucien Duckstein, and Chester C. Kisiel.
Proc Ser No 5, Proc Nat Symp Analysis Water-resour Syst, p 100-115, July 1968. 16 p, 60 ref.

Descriptors: *Groundwater, Reviews, Bibliographies, *Systems analysis, Input-output analysis, Optimum development plans, Aquifers, Mathematical analysis, *Mathematical models, Economics, Dynamic programming, Ecology, Groundwater mining, Numerical analysis, Groundwater recharge, Operations research, Economic justification.
Identifiers: Systems engineering, Problem solving, Hydrologic models, Black box analysis, Well yield, *Groundwater management.

A summary of the state of the art in ground-water systems analysis is presented. Scope of the paper is a combination of concepts from general systems theory, operations research, human factors (economics and social sciences), engineering mathematics, probability and statistics, numerical analysis, and computer sciences woven onto a fabric of classical and modern hydrology. Future strategies for management of the ground-water system must be mixed. Proposed management models require extensive evaluation in a real-world context. Orderly control of withdrawals will be needed to avoid local depletion. Contamination resulting from encroachment of water from the sea or from portions of an aquifer containing saline water must be prevented as well as contamination by indiscriminate deep disposal of waste waters. Ecology as the science of interrelationships must be considered. Economic consequences of ecological factors should be treated as a social cost. Modern developments in systems analysis can sharpen professional judgment and decisions in managing ground-water systems. The formalism and classification outlined are suggested as a complement to the intuitive judgment of professionals having extensive experience in ground-water systems. (USBR)

SUBSURFACE FLOW REGIMES OF A HYDROLOGIC WATERSHED MODEL,
Department of Agriculture, Beltsville, Md.
C. A. Onstad, and D. G. Jamieson.
Second Seepage Symposium, Proceedings, Phoenix, Arizona, Mar 25-27, 1968. Agricultural Research Service, Washington, DC, ARS 41-147, 1969. 10 p, 9 fig, 11 ref.

Descriptors: *Subsurface flow, *Base flow, *Storage coefficient, *Reservoir storage, Watersheds (Basins), Return flow, Hydrology, Groundwater, Groundwater flow, Hydrographs, Groundwater movement, Rainfall-runoff relationships, Seepage, Simulation, Rainfall, Parametric hydrology, Overland flow, Runoff, Infiltration, Outflows.
Identifiers: *Hydrologic models, *Runoff hydrographs.

Historically, separation of baseflow from the total hydrograph was arbitrarily performed under various concepts. All traditional methods of baseflow separation terminate at a nebulous point on the hydrographic recession limb where the flow is assumed to be baseflow. In addition, the assumption is made that the peak baseflow is somehow connected to an identifiable point on the surface runoff hydrograph. The former assumption is subjective; the latter is usually unrealistic. In contrast, the model presented attempts to simulate objectively various subsurface flow regimes. Despite the necessity of inferring the inputs to the various flow regimes, the model is realistic, using only the measured response of each flow regime. The purpose of the model is to separate baseflow from the total hydrograph and to simulate and later synthesize the land phase of the hydrologic system. The model possesses thresholds that make the system nonlinear, but linear reservoir theory is applicable above the thresholds. Few parameters must be derived by iteration since the majority are inserted as measurable quantities. The system is flexible--reservoirs can be added, subtracted, or combined, depending upon the response of the particular watershed. (USBR)

2G. Water in Soils

STEADY FLOW OF WATER THROUGH A TWO-LAYER SOIL,
Iowa State Univ., Ames.

Sam-Arnq Srinilta, D. R. Nielsen, and Don Kirkham.
Water Resources Res, Vol 5, No 5, p 1053-1063, Oct 1969. 11 p, 17 fig, 1 tab, 14 ref.

Descriptors: *Soil water movement, *Anisotropy, *Steady flow, Darcy's law, Hydraulic conductivity, Pore pressure, Sorption, Particle size, Clays, Unsaturated flow, Hysteresis.
Identifiers: Layered soils.

A laboratory study of water moving steadily through an isothermal two-layer soil was analyzed by using Darcy's equation for unsaturated flow. Factors considered were thickness and kinds of topsoil, depth of surface water ponding, magnitude of outflow water pressure, and soil water history of the profile. Soil water pressure distributions were measured at 5-cm depth intervals along the vertical columns. The unsaturated hydraulic conductivity was measured for sorption and desorption for each of four soils used as topsoil and subsoil in the two-layer columns. Values of hydraulic conductivity as a function of soil water pressure were used to predict the measured soil water pressure distributions and steady state fluxes. The agreement between predicted and measured profiles is exceptionally close. The necessity of distinguishing between sorption and desorption, of obtaining a uniform soil bulk density distribution within each soil layer, and of ascertaining the hydraulic conductivity as a function of soil water pressure is discussed in relation to the predicted soil water pressure distribution and flux values. (Knapp-USGS)

HYDROSTATICS AND HYDRODYNAMICS IN SWELLING SOILS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
J. R. Philip.
Water Resources Res, Vol 5, No 5, p 1070-1077, Oct 1969. 8 p, 1 fig, 42 ref, append.

Descriptors: *Soil water movement, *Expansive soils, *Expansive clays, Darcy's law, Hydraulic conductivity, Hydrodynamics, Consolidation, Unsteady flow, Steady flow, Unsaturated flow, Infiltration, Diffusion.
Identifiers: Soil water hydrodynamics, Moisture gradients.

The generalization to swelling soils of the mathematical theory of water movement in unsaturated soils involves the following extensions to the classic analysis: (1) recognition that Darcy's law applies relative to the soil particles, (2) inclusion of the void ratio function in the characterization of the soil, and (3) reconsideration of hydrostatics in swelling media. For swelling soils the total potential includes an additional component, the overburden potential, evaluation of which leads to the condition for equilibrium in the vertical, which is a first order linear differential equation with singular coefficients. Three types of equilibrium profile follow: hydric profiles with moisture gradient less than 0, pycnotatic profiles with gradients of 0, and xeric profiles with gradients greater than 0. Other phenomena in swelling soils treated include steady vertical flows and unsteady horizontal and vertical flows. Classic concepts of groundwater hydrology, tacitly based on the behavior of nonswelling media, fail completely for swelling soils. The approach also provides a theory of consolidation which includes the influences of (1) soil particle movement, (2) unsaturation, and (3) self-weight. (Knapp-USGS)
W70-00841

A NUMERIC METHOD FOR ESTIMATING INFILTRATION, REDISTRIBUTION, DRAINAGE, AND EVAPORATION OF WATER FROM SOIL,
Utah State Univ., Logan; Illinois Univ., Urbana; and Colorado State Univ., Fort Collins.
R. J. Hanks, A. Klute, and E. Bresler.
Water Resources Res, Vol 5, No 5, p 1064-1069, Oct 1969. 6 p, 7 fig, 4 ref.

Descriptors: *Soil water movement, *Infiltration, *Percolation, *Drainage, *Evaporation, Hysteresis, Unsaturated flow, Numerical analysis, Digital computers, Profiles, Hydraulic conductivity.
Identifiers: Soil water redistribution.

A general numeric method is described for estimating one-dimensional infiltration, redistribution, evaporation, and drainage of water from soil. The type of flow is determined by the water flux at the surface of soil or the bottom boundary. The method provides for hysteresis in the water content - pressure head relation. Comparison with measurement made on soil columns for infiltration, redistribution, and evaporation were made. Good agreement was obtained between measured and computed values. (Knapp-USGS)

WATER-RETENTION CHARACTERISTICS OF COARSE ROCK PARTICLES,
Khartoum Univ. (Sudan). Dept. of Geology; and Missouri Univ., Columbia. Dept. of Geology.
Ismail M. El Boushi, and Stanley N. Davis.
J Hydrol, Vol 8, No 4, p 431-441, Aug 1969. 11 p, 7 fig, 1 tab, 4 ref.

Descriptors: *Water storage, *Infiltration, *Recharge, *Gravels, *Specific retention, Percolation, Unsaturated flow, Rainfall-runoff relationships, Surface-groundwater relationships, Wetting, Wettability, Surfaces, Saturation.
Identifiers: Rock rubble.

Water is retained on large particles of non-porous rock as a film of water about 0.1 mm thick on rock surfaces, as 0.006 to 0.180 ml droplets held at contact points between adjacent particles, and as small puddles of water on the upper surfaces of the rock. Water retained at contact points accounts for most of the water stored within aggregates of particles with diameters smaller than 30 mm. Whereas with diameters larger than 100 mm, water retained on the rock surfaces, particularly water puddled on top of the rock, accounts for most of the water. Infiltrating water will not wet all the rock surfaces. More than 50% of the surfaces may be dry at depth. The total amount of rainfall needed to initiate groundwater recharge in many areas having coarse rock particles at the surface is probably less than 1.0 cm. (Knapp-USGS)

WATER TEMPERATURE DURING THE MELTING OF LAKE ICE,
National Research Council of Canada, Ottawa (Ontario).
G. P. Williams.
Water Resources Res, Vol 5, No 5, p 1134-1138, Oct 1969. 5 p, 4 fig, 2 tab, 8 ref.

Descriptors: *Water temperature, *Lake ice, *Melting, Climates, Albedo, Solar radiation, Energy budget.
Identifiers: *Canada, Ontario, White Lake, Ice thickness.

Water temperature and ice thickness were measured during the ice melt period at Bennett Bay, White Lake, Ontario. Water temperatures were as high as 7.5 deg C under the melting ice cover. The heat needed to warm the water under the ice and to melt ice at the ice-water interface was calculated for different periods and compared with the heat available from solar radiation that penetrated the ice cover. It was concluded from these calculations that solar radiation penetrating the ice caused the relatively high water temperatures observed under the melting ice. (Knapp-USGS)

NEW THERMAL INVESTIGATION OF LAKES TRAUHSEE AND FUSCHLSEE (IN GERMAN),
O. Eckel.
Verh Internat Verein, Limnol, XIV, Stuttgart, p 70-78, July 1961.

Descriptors: *Lakes, *Thermal properties, *Stratification, Epilimnion, Hypolimnion, Thermocline, Temperature, Wind velocity, Meteorological data.

Investigations of thermal changes in various depths of two lakes in Austria proved the dependence of water temperature fluctuation in all layers on meteorological conditions. It was stated that the mutual dependence between the motion of water, wind, and temperature distribution exists. It was also stated that the water in deeper layers is always in motion even if the water surface of a lake is quiescent. The investigated temperature fluctuations were either periodical or non-periodical. The former had 24-hour periods and the latter were caused by wind effects. Periodical wind formation caused an occurrence of free currents in both lakes. The total movement of water particles in all layers of a lake were found to be the vector summation of wind effects and inert waves. The influence of warm storm air on temperature change was most remarkable in the deeper layers (differences up to 2C in a 50 m deep layer in comparison with 0.3C in the surface layer). (Novotny-Vanderbilt)

A STOCHASTIC APPROACH TO THE DEVELOPMENT OF A REGULATION PLAN FOR THE GREAT LAKES,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch; and McGill Univ., Montreal (Quebec).
R. H. Clark, and G. S. Cavadias.
Proc, Int Hydrol Symp, Vol 1, Colo State Univ, p 430-442, Sept 1967. 13 p, 8 fig, 4 tab, 4 ref.

Descriptors: *Stochastic processes, *Great Lakes, *Simulation analysis, *Optimization, *Water resources development, Navigation, Hydroelectric power, Operating costs, Water control, Water levels, Synthetic hydrology.
Identifiers: Multivariate model.

A progress report was given on research results of a joint United States-Canadian regulation study for the Great Lakes. The objective of the study was to establish a regimen of lake levels and outflows which would maximize the benefits and minimize the detriments equitably among all interests. Navigation was best served by high lake levels, hydro-power generation by maintenance of minimum flows as large as feasible, while shore property interests benefited most by reductions in the extremes of both high and low lake levels. Computer simulation techniques were used both for generating and testing artificial flow sequences and for determining the consequences of various operating plans. The multivariate model proposed by Fiering was used in the simulation and the sequences generated were subjected to several tests

order to verify whether properties of the ecorded supplies were conserved. The regulation lan was considered as a sequence of decisions nder uncertainty with the testing record generated y a stochastic process. (Thiuri-Cornell)

LIMNOLOGICAL COMPARISON OF TWO MALL IDAHO RESERVOIRS,
daho Univ., Moscow. Dept. of Biological Sciences.
ary W. Miller, and Fred W. Rabe.
ydrobiologia, Vol 33, No 3-4, p 523-544, July 22, 969. 22 p, 12 fig, 4 tab, 38 ref.

escriptors: *Limnology, *Idaho, *Reservoirs, ampling, Physicochemical properties, Zooplank-n, Nannoplankton, Productivity, Mapping, nalytical techniques, Water level fluctuations, Vater temperature, Heat budget, Organic matter, ydrogen, Carbon dioxide, Seasonal.
dentifiers: Reservoir limnology.

hysicochemical characteristics of the water, ooplankton, and nannoplankton concentrations of vo Idaho reservoirs were investigated by using hemical analysis, electronic thermometers, a ecchi disk, and C-14 isotope methods. No well-efined thermocline can be identified in Deep reek or Crowthers Reservoir. Annual heat budget estimated to be about 15,000 cal/sq cm for both eservoirs, with low dissolved oxygen concentra-ons on the bottom during the summer months. oth reservoirs are alkaline with pH ranging from .5 to 8.9. The mean summer primary production ates of nannoplankton were 9.9 mg cu m/hr and .7 mg cu m/hr for the Crowthers and for the Deep reek Reservoirs, respectively. The biomass of etrital heterotrophs was highest in the Crowthers eservoir. (Gabriel-USGS)

DIAGENETIC CHANGES IN INTERSTITIAL VATERS OF HOLOCENE LAKE CONSTANCE EDIMENTS,
leidelberg Univ. (West Germany). Sediment Lab.
erman Muller.
lature, Vol 224, p 258-259, Oct 1969. 2 p, 2 fig, 5 ef.

escriptors: *Water chemistry, *Diagenesis, Lakes, Sedimentation, Fresh water, Chemical eactions, Mineralogy, Clays, Organic matter, iodegradation, Sedimentation rates.
dentifiers: *Lake Constance, *Switzerland.

Vater samples from cones taken from the bottom f Lake Constance, Switzerland were analyzed. In ne fresh water sediments of the lake the pore water s changed considerably after entrapment so that it s no longer similar to the lake water. The sulfate ontent is entirely removed, chlorine is depleted, nd Na, K, Mg, silica, nitrogen, phosphorus, and icarbonate are considerably increased by reac-ons between water and minerals and by organic ecay. EASONAL CHARACTERISTICS OF TWO ALINE LAKES IN WASHINGTON,
Vashington Univ., Seattle. Dept. of Zoology.
. C. Anderson.
imnology and Oceanography, Vol 3, p 51-68, 958. 6 fig, 4 tab, 21 ref.

escriptors: *Saline lakes, *Washington, Seasonal, *Limnology, *Arid lands, Phytoplank-on, Distribution, Sampling, Temperature, Oxygen, Hydrogen ion concentration, Alkalinity, Phosphates, Chlorophyll, Shallow water, Nutrients, Diatoms, Depth, Biota, Meromixis, Zooplankton, Calcium, Magnesium, Sodium, Potassium, Carbonates, Sulfates, Bicarbonates, Chlorides, Nitrates, Outlets, Evaporation, Runoff, Hydrogen sulfide, Stratification, Diatoms, Spores, Rotifers, Cyanophyta, Chrysophyta, Chlorophyta.
Identifiers: Morphometric conditions, Transparency, Lake Lenore (Wash), Amphora, Chaetoceros elmorei, Soap Lake (Wash), Monimolimnion, Dictichlis stricta, Mixolimnion, Scirpus nevadensis, Juncus bufonius, Asterionella formosa, Cyclotella, Eunotia, Fragilaria crotonensis, Melosira distans, Navicula, Nitzschia, Tabellaria flocculosa, Gloeocystis, Oscillatoria, Spirulina major, Ceratoneis, Cladocera, Lake volume.

Limnology of two saline lakes in Washington was studied in relation to physical and chemical conditions influencing growth and distribution of phytoplankton. The lakes were sampled at frequent intervals for more than a year, between 1950 and 1951. Morphometric conditions were determined, and routine sampling included measurements of temperature, transparency, oxygen, pH, alkalinity, phosphate, chlorophyll, and quantitative samples of phytoplankton. Lake Lenore, the less saline of the two (total dissolved solids, 14 grams/liter), is shallow and was unstratified during the investigation. Dissolved nutrients were high and varied erratically during summer. The taxonomically simple phytoplankton population is comprised mainly of two species of diatoms--Amphora sp, which forms the spring bloom, and Chaetoceros elmorei, which constitutes the late summer bloom. Soap Lake is relatively deep, meromictic, and saline (total dissolved solids, 35 grams/liter). Temperature conditions are dichothermic, and nutrient content high, especially in the monimolimnion. A winter maximum and summer minimum in the phytoplankton population was observed and a change in the biota during dilution of the lake in recent years is described. There are indications that phytoplankton is grazed by zooplankton in both lakes. (Jones-Wisconsin)

SOME LIMNOLOGICAL FEATURES OF A SHALLOW SALINE MEROMICTIC LAKE,
Washington Univ., Seattle. Dept. of Zoology.
G. C. Anderson.
Limnology and Oceanography, Vol 3, p 259-270, 1958. 6 fig, 4 tab, 16 ref.

Descriptors: *Limnology, *Arid lands, *Saline lakes, *Meromixis, *Shallowwater, Washington, Magnesium compounds, Temperature, Chara, Cyanophyta, Sulfur bacteria, Zooplankton, Gypsum, Hydrogen ion concentration, Oxygen, Dissolved solids, Light penetration, Depth, Volume, Runoff, Seasonal, Hydrogen sulfide, Solar radiation, Evaporation, Heating, Light intensity, Chlorides, Bicarbonates, Sodium, Rotifers, Copepods, Aerobic conditions, Thermal stratification, Lake morphology.
Identifiers: Kruger Mountain (Wash), Hot Lake (Wash), Oroville (Wash), Distichlis spicata, Artemia salina, Transparency, Morphometry, Lake area, Monimolimnion, Vertical, Mixolimnion, Chemocline, Chlorobium, Salt gradient, Bottom waters, Heat gain, Heat loss, Mineral analyses, Plectonema nostocorum, Oscillatoria chlorina, Anacystis thermalis, Gomphosphaeria aponina, Brachionus angularis, Keratella quadrata, Ostracod, Branchinecta, Epsom salt.

Seasonal variations of some physical, chemical, and biological features were studied from December 1954 to October 1956 in Hot Lake, a shallow saline body of water occupying a former epsom salt excavation in north central Washington. Since it has neither an inlet nor outlet, evaporation is important. The lake is meromictic, and, during the period of study, had an average salt gradient of approximately 100 grams per liter (g/l) at the surface to 400 g/l at the bottom, the major salt being magnesium sulfate. The mixolimnion was thin enough that the monimolimnion was heated directly by the sun, with resulting temperatures in excess of 50 deg C recorded in the monimolimnion during summer. The mixolimnion was transparent; the monimolimnion, opaque. Much of this heat was retained during the winter. The calculated value of heat gain in the monimolimnion agreed well with observed values. The flora consisted mainly of Chara, a bottom mat of blue-green algae, and a dense population of green sulfur bacteria in the upper part of the monimolimnion. Artemia salina was the dominant zooplankter, and some features of its life history, as affected by the unusual thermal properties of the lake, are described. (Jones-Wisconsin)

LIMNOLOGICAL EFFECTS OF ORGANIC EXTRACTS OF LITTER IN A SOUTHWESTERN IMPOUNDMENT,
Arizona Univ., Tucson; and Arizona Cooperative Fishery Unit, Tucson.
William J. McConnell.
Limnology and Oceanography, Vol 13, No 2, p 343-349, Apr 1968. 1 fig, 4 tab, 16 ref.

Descriptors: *Limnology, *Organic matter, *Impoundments, *Arizona, Biomass, Carbohydrate, Epilimnion, Hypolimnion, Watershed, Ecology, Lakes, Secondary productivity, Pass, Food chains, Microorganisms, Snails, Zooplankton, Fish, Harvesting.
Identifiers: Phenolics, Xenopus laevis, Micropterus salmoides, Litter (Forest), Pena Blanca Lake (Ariz), Quercus emoryi, Quercus oblongifolia, Ecological efficiencies, Production (Fish), Harvest (Fish).

Torrential rains in July, following dry winters and springs, cause considerable quantities of litter from the watershed to be deposited into impoundments in southeastern Arizona, with subsequent limnological consequences. Author describes limnological effects of oak litter extracts, the dominant evergreen, in Pena Blanca Lake which received 750 grams/square meter of litter during summer of 1959. Cold-water extracts of oak litter reveal that carbohydrates and phenolics were the major soluble compounds. Glucose was the predominant sugar. Presence of an unidentified compound was suggested as postulated to be an organic acid. Growth rates of larval Xenopus laevis were significantly increased by addition of oak leaves to the environment. Estimated production during 1959 of trophically similar animals attributed to litter import was 2.35 grams biomass/square meter. (Daniel-Wisconsin)

2I. Water in Plants

ESTIMATES OF PERIPHYTON MASS AND STREAM BOTTOM AREA USING PHOSPHOROUS-32,
Oak Ridge National Lab., Tenn. Radiation Ecology Section.
D. J. Nelson, N. R. Kevern, J. L. Wilhm, and N. A. Griffith.
Water Research, Vol 3, No 5, p 367-373, May 1969. 7 p, 1 tab, 15 ref.Res sponsored by U.S. Atomic Energy Comm under contract with Union Carbide Corp.

Descriptors: *Periphyton, *Phosphorous radioisotopes, *Biomass, *Analytical techniques, Channel morphology, Sediments, Sorption, Radioactivity techniques, Biota, Hydraulic properties, Roughness (Hydraulic).
Identifiers: *Periphyton mass measurement, Bottom surface (Streams).

A rapid method is given for determining the biomass of periphyton and the bottom surface area of a small rocky stream by using P-32. About 75% of the introduced P-32 was retained within a 100 m study area. Periphyton on artificial substrate sorbed 254 times more P-32 than sediments and 48 times more than leaves. The absorption of P-32 was also measured for natural substrata. Uptake appeared to be a surface phenomenon. Total standing crop in the test area was calculated to be 1.5 kg. The bottom area was found to be 560 sq m, about four times larger than estimated by usual surface measurements. In view of the irregular topography of the stream bottom, the value obtained from uptake of P-32 requires better estimation of the total bottom area than available from surface measurements. The technique is adaptable to shallow streams where periphyton is a major component of the biota. The technique can be used for measurement of surface areas for uneven stream channels and hydraulic parameters such as bed roughness. (Carstea-USGS)

NET RADIATION IN A RIPARIAN MESQUITE COMMUNITY,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
J. M. Tromble, and J. R. Simanton.
Water Resources Res, Vol 5, No 5, p 1139-1141, Oct 1969. 3 p, 1 fig, 6 ref.

Descriptors: *Solar radiation, *Mesquite, *Arid lands, Energy budget, Energy, Albedo, Meteorology.
Identifiers: Net radiation.

Net radiation patterns for a riparian mesquite community are similar to net radiation patterns obtained for a humid forest. The net radiation peak of the open area was 61% of the net radiation peak above the canopy. The net radiation within a mesquite canopy peaked 9% higher but had a lower daily total value than the radiation above the canopy. The differences in net radiation peaks were attributed to differences in the canopy geometry, solar position, and surface reflectance, whereas differences in daily net radiation were attributed to differences in surface reflectance characteristics. (Knapp-USGS)
W70-00853

THE DEVELOPMENT AND DISTRIBUTION OF PLANKTON IN THE NORTHERN PART OF THE WHITE NILE,
Khartoum Univ. (Sudan). Dept. of Zoology.
Y. B. Abu Gideiri.
Hydrobiologia, Vol 33, No 3-4, p 369-378, July 22, 1969. 10 p, 7 fig, 7 ref.

Descriptors: *Plankton, *Rivers, *Plant growth, *Water quality, Plant populations, Sampling, Electrical conductance, Biology, Water chemistry, Oxygen, Ions, Chlorides, Sulfates, Crustaceans, Seasonal, Organic matter, Temperature, Alkalinity.
Identifiers: *Sudan, White Nile.

The plankton population of the White Nile was investigated by analyzing samples from three stations located along the 45 km course of the river and using the results of earlier publications. The study shows the presence of two yearly plankton growth peaks whose development and distribution are correlated with environmental conditions such as transparency, temperature, dissolved gases, nutrients, pH, alkalinity, conductivity, etc. Rotifers outnumber crustaceans at the Morgan sampling station and are at equilibrium at Jebel Aulia. The presence of Tropodiaptomus processifer, T. Kraepelini, T. Orientalis, Brachionus caudatus, Anabaenopsis circularis, and Closterium bibleinii at the Morgan sampling station indicates the effect of the Blue Nile waters on the White Nile. (Gabriel-USGS)

EFFECTS OF EXTERNAL SALT CONCENTRATIONS ON WATER RELATIONS IN PLANTS: SIGNIFICANCE OF EXTERNAL WATER-POTENTIAL AND SALT-TRANSPORT KINETICS ON RATE OF CELL EXPANSION,
California Univ., Riverside.
J. J. Oertli.
Soil Science, Vol 105, No 4, 1968, p 216-222. 7 p, 2 fig, 18 ref.

Descriptors: *Salinity, *Saline soils, *Soil-water-plant relationships, *Plant physiology, *Plant growth, Osmotic pressure, Turgidity, Xylem, Kinetics, Cytological studies.
Identifiers: *Turgor pressure, Salt transport.

Soil salinity generally results in a reduction of plant growth. This report theoretically investigates the effect of external salt concentration and of the solute transport on cell elongation. When internal hydrostatic pressure exceeds external pressures, plant cells elongate. If water transport into the cell occurs in response to salt addition to the vacuole, the rate-limiting factor is probably the salt, and not the water transport. Solute requirement is a function of total water potential at the root surface. Salt transport rates depend upon external concentration and obey kinetics of decreasing efficiency. The cell elongation rate depends upon external concentration; the time for unit elongation decreases, passes through a minimum and subsequently increases in the range of saline conditions. Experimental support of the conclusions will be presented in a subsequent paper. (Crouse-Arizona)

2J. Erosion and Sedimentation

ANNOTATED BIBLIOGRAPHY ON HYDROLOGY AND SEDIMENTATION, 1963-65, UNITED STATES AND CANADA.
Engineering-Science, Inc., Los Altos, Calif.

For sale by the Superintendent of Documents, US Government Printing Office, Wash, DC 20402, price $4.50. Joint Hydrol-Sedimentation Bull No 9, Inter-Agency Comm on Water Resources, June 1969. 527 p.

Descriptors: *Bibliographies, *Water resources, *Hydrology, *Sedimentation, Abstracts, Documentation, Sediment transport, Groundwater movement, Hydrogeology, Hydraulics, Open channel flow, Water law, Water management (Applied).
Identifiers: Hydrology and sedimentation bibliography.

The Hydrology and Sedimentation Committees, Water Resources Council, have sponsored this Bibliography as a guide to literature on hydrology and sedimentation for the use of Government agencies and the public. Every effort has been made to cover all such literature published in the United States and Canada during 1963-1965. The index of the bibliography covers both place and subject. In the United States and Canada, the smallest geographical subdivisions used are states and provinces. Elsewhere, geographical subdivision is by country. For papers applying to areas larger than the smallest subdivision, entries are listed under major river basins in the United States and by continents for the rest of the world. In general, listings in the index are primary. (Knapp-USGS)
W70-00837

MODIFIED RUBEY'S LAW ACCURATELY PREDICTS SEDIMENT SETTLING VELOCITIES,
Texas Univ., Austin.
Richard L. Watson.
Water Resources Res, Vol 5, No 5, p 1147-1150, Oct 1969. 4 p, 2 fig, 1 tab, 3 ref.

Descriptors: *Settling velocity, *Equations, *Particle size, *Particle shape, *Analytical techniques, Viscosity, Reynolds number, Deposition (Sediments), Suspension.
Identifiers: Settling tubes, Sediment analyzers.

Modification of viscous drag and the pressure drag terms in Rubey's theoretic equation for settling velocity of sand grains with two empirically determined constants results in a formula which predicts accurately the settling velocity of groups of sand grains measured with the woods Hole rapid sediment analyzer. This modified formula can now be used for calculation of particle size with fall time data from the sediment analyzer. The advantage of this method rather than the use of empiric data for particle size determination is that the determination can be made regardless of the water temperature in the settling tube, the viscosity of the fluid in the tube, or the relative densities of the fluid and the particles, as long as these values are known. SOIL MOVEMENT ON IRREGULAR SLOPES,
Agricultural Research Service, Morris, Minn. Soil and Water Conservation Research Div.
Robert A. Young, and Calvin K. Mutchler.
Water Resources Res, Vol 5, No 5, p 1084-1089, Oct 1969. 6 p, 2 fig, 4 tab, 11 ref.

Descriptors: *Soil erosion, *Model studies, *Simulated rainfall, Gully erosion, Rill erosion, Sheet erosion, Runoff, Slopes, Topography, Soil conservation, Rainfall intensity, Tracers, Dye releases.
Identifiers: Soil erosion test plots, Soil movement tracers.

Soil loss and runoff were measured from concave, uniform, and convex slopes subjected to simulated rainfall. Fluorescent glass particles and microrelief measurements were used to determine soil movement patterns in the slopes. For slopes of equal average steepness, a concave shape greatly reduced the total sediment loss in comparison with that from either a uniform or convex slope. Average slope steepness was not a good indicator of soil delivery past a given point except for a uniform slope. In general, soil losses from irregular slopes depend on the steepness of a short section of that slope immediately above the point of measurement. Soil movement off the plots was primarily transport by raindrop splash to a rill system and then transport down the slope by runoff in the rill system. A breakdown of the rill system occurred on the bottom of the concave slopes because of decreasing local steepness, resulting in sheet flow and sediment deposition. (Knapp-USGS)
W70-00864

RELATIVE DENSITY EFFECTS ON INCIPIENT BED MOVEMENT,
Minnesota Univ., Minneapolis.
Bruce D. Ward.
Water Resources Res, Vol 5, No 5, p 1090-1096, Oct 1969. 7 p, 4 fig, 2 tab, 10 ref.

Descriptors: *Bed load, *Sediment transport, Tractive forces, Shear stress, Shear drag, Mathematical studies, Density, Model studies, Hydraulic models, Turbulence, Turbidity.
Identifiers: Bed load movement, Stress analysis.

The Shields entrainment function, extrapolated from bed load movement to predict the threshold of particle motion, appears deficient in analyzing incipient shear data for fluid-sediment combinations encompassing a wide range of relative densities. Equations describing incipient dynamic equilibrium, solved semiempirically, indicate addi-

ional density considerations that must be included n an attempt to correlate initial movement for all ossible sedimentation density ratios. This and ther experimental investigations also indicate any ntrainment function to be independent on the tate of the bed and corresponding turbulence. Other factors which might be influential on the hreshold of particle movement are mentioned. (K-app-USGS)

FLUORESCENT SAND AS A TRACER OF FLUVIAL SEDIMENT,
Geological Survey, Menlo Park, Calif.
Vance C. Kennedy, and Dorothy L. Kouba.
Geol Surv Open-file Rep, 1968. 53 p, 14 fig, 4 tab, 21 ref.

Descriptors: *Sediment transport, *Tracers, *Fluorescence, *On-site tests, Sedimentary rocks, Rivers, Sands, Sampling, Petrology, Mapping, Discharge measurement, Mathematical studies, Suspended load, Currents (Water), Velocity, Streamflow.
Identifiers: *Fluvial sediments, Fluorescent sand tracer.

A description is given of on-site tests to evaluate use of the fluorescent sand method as a means of measuring sediment discharge in a gravel-bed stream. Stream sand coated with fluorescent paint was added at a constant known rate to Clear Creek at Golden, Colorado, during a 28-hour period and the concentration of fluorescent grains was recorded at a site 810 meters downstream from the point of introduction. First-arrival time of fluorescent sand was correlated with the square of grain diameter for particles in the range of 0.15-0.86 mm. Complete lateral mixing of fluorescent sand was not achieved within the study reach, but steady-state conditions apparently were achieved for the finer particles. The lateral mixing of coarser grains was found to be much better than that for finer grains. Sediment discharge computed from the tracer dilution method was about 30% greater than the suspended-sediment discharge computed for suspended samples of the 0.15-0.18 mm range and about 200% greater for the 0.38-0.52 mm range. FREQUENCY DISTRIBUTIONS OF STREAM LINK LENGTHS,
Princeton Univ., N.J. Dept. of Statistics.
W. R. James, and W. C. Krumbein.
Office of Naval Research Contract Nonr-1228 (36), ONR Task No 389-150. J Geol, Vol 77, No 5, p 544-565, Sept 1969. 22 p, 9 fig, 6 tab, 14 ref.

Descriptors: *Topography, *Drainage patterns (Geologic), *Streams, *Statistical models, Drainage density, Tributaries, Markov processes, Stochastic processes, Networks, Regional analysis.
Identifiers: *Drainage basin morphology, Drainage net topology.

Theories of drainage basin topology are reviewed and compared, and a new theoretical analysis is offered. Analysis of interior links in a magnitude 1311 basin shows that the probability of successive tributaries entering main channels from the same side is only about two-thirds the probability of opposite-side entry. These higher-order structures in the data (the spatial arrangement of successive tributaries) display a first-order Markovian property in sequences of link type. These structures are examined in their substantive context, and a composite gammalike population density for interior link lengths is developed theoretically. This density contains the higher-order structures and agrees, at least approximately, with observed relations in main channels of magnitude 10 or greater. (Knapp-USGS)

THE LAKE MISSOULA FLOODS AND THE CHANNELED SCABLAND,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
J. Harlen Bretz.
J Geol, Vol 77, No 5, p 505-543, Sept 1969. 39 p, 10 fig, 2 plate, 2 tab, 53 ref.

Descriptors: *Geomorphology, *Topography, *Floods, *Pleistocene epoch, *Columbia River, Oregon, Washington, Montana, Idaho, Erosion, Historic flood, Deposition (Sediments), Discharge (Water), Sedimentary structures, Sedimentation, Channel morphology.
Identifiers: Channeled Scablands.

This paper reviews the outstanding evidence for repeated catastrophic outbursts of Montana's glacially dammed Lake Missoula. Flooding consequently overwhelmed in many places the preglacial divide along the northern margin of the Columbia Plateau in Washington. The plateau's preglacial drainage pattern was remade into an anastomosing complex of floodwater channels (Channeled Scabland) locally eroded hundreds of feet into underlying basalt. These flood-born rivers converged into the Columbia Valley at least as far as Portland, Oregon, depositing a huge delta at Portland. Evidence that the major scabland rivers and the flooded Columbia were hundreds of feet deep exists in: gravel and boulder bars more than 100 ft high in mid-channels; subfluvial cataract cliffs, alcoves, and plunge pools hundreds of feet in vertical dimension; back-flooded silts high on slopes of preglacial valleys tributary to the scabland complex; and the delta at Portland. Climatic oscillations of the Cordilleran ice sheet produced a succession of Lake Missoulas. The Montana glacial record has been correlated with recurrent scabland floods by soil profiles and a glacial and loessial stratigraphy, and some events have been approximately dated by volcanic ash layers, peat deposits, and an archaeological site. THE VOLUME AND CHARACTER OF SILTING-SEDIMENTATION OF THE SIONI RESERVOIR (RUSSIAN),
G. S. Metrebeli.
Soobshchenie Akademii Nauk Gruzinskoi SSR, Vol 52, No 3, p 689-694, Dec 1968. 2 fig, 1 tab, 4 ref.

Descriptors: *Reservoir silting, *Water storage, *Silting, Rivers, Discharge (Water), Runoff, Water level fluctuations, Sedimentation rates, Geology, Organic matter, Solid wastes, Mathematical studies, Forecasting, Landslides.
Identifiers: *USSR, Sioni reservoir.

Silting of the Sioni reservoir, USSR, was investigated on the basis of geological and hydrological data recorded in 1963 to 1967. The sedimentary layer thicknesses vary from zero to 1.2 m. During 4 years of the existence of the reservoir the Iory River brought in 960,000 cu m of solid material in addition to 130,000 cu m brought in by minor streams. In general the silting can be considered as of minor importance because the bottom sediments can be easily transferred into the lower reaches of the Iory River by using suitable mechanical devices. (Gabriel-USGS)
W70-01019

THE ANALYSIS AND CLASSIFICATION OF SLOPE PROFILE FORMS,
Sheffield Univ. (England). Dept. of Geography.
R. A. G. Savigear.
Evolution Des Versants, Proc Symp de Geomorphologie, Liege-Louvain, Belgium, June 8-16, 1966, Vol 40, p 271-272, 1967. 2 p, 5 fig, 3 ref.

Descriptors: *Geomorphology, *Slopes, *Classification, *Profiles, *Terrain analysis, Mapping, Erosion, Surveys, Analytical techniques, Land forming, Topography, Sedimentation.
Identifiers: England, Slope profiles.

A classification of slope profiles is developed on the basis of data recorded at the seaward slopes in Cornwall, Southwestern England. The classification is of morphological character which essentially differs from earlier classifications of geomorphogenetic character. The techniques are intended to provide methods by which the recognition of the form elements of a profile may be investigated and objectively defined. The study contains the following topics: classification problems related to the selection and survey of profiles; methods of analysis and classification; measured length profile; the intercept profile; the unit profile; a classification of unit relationship; and a classification of unit groups. (Gabriel-USGS)

THE DYNAMICS OF QUATERNARY SLOPE EVOLUTION AND ITS GEOMORPHOLOGICAL REPRESENTATION,
M. Pecsi.
Evolution Des Versants, Proc Symp de Geomorphologie, Liege-Louvain, Belgium, June 8-16, 1966, Vol 40, p 187-199, 1967. 13 p, 6 fig, 1 tab, 2 ref.

Descriptors: *Dynamics, *Slopes, *Aeolian soils, *Erosion, *Quaternary period, Glaciation, Climates, Sedimentation, Freezing, Topography, Geology, Clays, Loess, Sands, Gravels, Solifluction, Mass wasting, Deposition (Sediments).
Identifiers: *Hungary, Danube basin, Slope evolution.

The stratigraphy of thick layers of Pleistocene loess of the Central Danube basin was investigated to determine the processes of formation of Quaternary slopes. The sedimentary layers of the hillslopes are well to poorly stratified and consist of aeolian loess, sands, and fossil-bearing soils. Subaerial stream erosion alternated with the processes of deposition; however, in many places the changes in the slope curvatures completely obliterated the high intensity processes of earlier accumulation and deposition. Cryogenic processes acted in different combinations, with different intensity and efficiency on different parts of the slopes, in function of the lithology, slope angle, exposure and, in general, of local biogeographical, morphological and microclimatical conditions. (Gabriel-USGS)
W70-01041

PLEISTOCENE ACTIVITY AND HOLOCENE STABILITY OF HILLSLOPES, WITH EXAMPLES FROM SCANDINAVIA AND PENNSYLVANIA,
Anders Rapp.
Evolution Des Versants, Proc Symp de Geomorphologie, Liege-Louvain, Belgium, June 8-16, 1966, Vol 40, p 229-244, 1967. 16 p, 5 fig, 1 tab, 14 ref.

Descriptors: *Erosion, *Slopes, *Slope stability, *Solifluction, *Pleistocene epoch, *Pennsylvania, Quaternary period, Glaciation, Geology, Altitude, Climates, Soils, Humidity, Mapping, Vegetation, Sediments, Mass wasting.
Identifiers: Scandinavia, Hillslopes.

A quaternary glaciated area of Sweden and a non-glaciated area of Pennsylvania were investigated for the evaluation of the stability of hillslopes. The studies conducted in Sweden show that the ice-lake shore lines at Lake Grovelsjon have been only very slightly deformed in 8000 years, indicating that solifluction, creep, and gullying can be rather weak, even on slopes of considerable inclination. Slopes with relatively high silt soil content are subject to much stronger processes of solifluction and mass wasting. The study of the Appalachian ridges of Pennsylvania indicates efficient mass wasting during cold Pleistocene tundra conditions and stability of slopes during the Holocene. In the evaluation of slope stability in the Pennsylvania area, it was assumed that the boulder strips are of the particular diagnostic value for this purpose. (Gabriel-USGS)
W70-01042

SOIL SLIPPAGE: AN INDICATOR OF SLOPE INSTABILITY ON CHAPARRAL WATERSHEDS OF SOUTHERN CALIFORNIA,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Robert G. Bailey, and Raymond M. Rice.
Professional Geographer, Vol 21, No 3, May 1969, p 172-177. 6 p, 2 fig, 7 ref.

Descriptors: *Semiarid climates, *Chaparral, *Slope stability, *Accelerated erosion, *California, Root zone, Soil physical properties, Vegetation effects, Erosion, Landslides, Watersheds (Basins).
Identifiers: *Slippage.

Soil slips, small landslides involving only the material above the unweathered bedrock surface, are characteristic of the young, steep mountains of semiarid southern California and are a major erosional agent. The slips, associated with occassional intense high volume storms, strip substantial areas of soil and vegetative cover, causing downstream damage and adversely affecting local water supply. A study of slips on the San Dimas Experimental Forest showed that slope was the most important site characteristic associated with soil slips. The immediate slope on slips occurred was never less than 80%. Other important factors included the density and rooting depth of vegetative cover, soil physical properties, and soil depth (shallow soils were more likely to slip). In one storm slip erosions produced 81 cubic yds. per acre on slopes converted to shallow rooted grasses, whereas in adjacent deep-rooted chaparral areas 11 cubic yds. were eroded. (Crouse-Arizona)

SHEETFLOODS, STREAMFLOODS, AND THE FORMATION OF PEDIMENTS,
Connecticut Univ., Storrs.
Perry H. Rahn.
American Association of Geographers, Annals, Vol 57, No 3, Sept 1967, p 593-604. 12 p, 2 tab, 16 fig, 20 ref.

Descriptors: *Arid lands, *Geomorphology, *Erosions, *Sheet floods, *Floods, Streamflow, Arizona, Supercritical flow, Geologic formations, Rainfall-runoff relationships, Hydrology.
Identifiers: *Pediments, *Bahadas.

Four summer floods were observed in the arid southern Arizona basin and range country. All were confined to pediments or bahadas. Two characteristics of storm runoff were noted. Floods near or on pediments exhibited supercritical flow and were termed streamfloods. Thunderstorm runoff on the bahadas manifested itself as sheet floods. Land surface of the pediments was found to be dissected by gullies, whereas bahadas nearer the center of the basins were of smoother, rolling topography. (Crouse-Arizona)

ON THE HYDROGEOLOGY OF THE CENTRAL AND NORTHWESTERN PART OF THE DNIEPER-DONETS ARTESIAN BASIN (UKRAINIAN),
Kharkov State Univ., (USSR).
G. M. Zakjarchenko, and V. P. Litvinov.
English summary. Dopovidi Akad Nauk, Ukr, RSR, Ser B, Geol, Geofis, Khim, and Biol, No 7, p 582-586, 1969. 1 fig, 2 tab.

Descriptors: *Hydrogeology, *Groundwater basins, *Artesian wells, *Water chemistry, Aquifers, Boreholes, Stations, Sampling, Mapping, Sodium, Potassium, Carbonates, Chlorides, Magnesium, Salinity.
Identifiers: *USSR, Ukraine, Dnieper-Donets artesian basin.

Chemical composition of the Dnieper-Donets artesian basin water was analyzed by taking water samples at 13 localities. The 5 water types detected are: calcium bicarbonate, calcium-sodium-bicarbonate-sulfate, sodium bicarbonate, sodium chloride, and bicarbonate-sodium-chloride. (Gabriel-USGS)

DISTINGUISHING MARINE AND FRESH-WATER MUDS,
Illinois Geological Survey, Urbana; and Indiana Univ., Bloomington.
N. F. Shimp, J. Witters, Paul Edwin Potter, and J. A. Schleicher.
J Geol, Vol 77, No 5, p 566-580, Sept 1969. 15 p, 4 fig, 7 tab, 14 ref.

Descriptors: *Geochemistry, *Mud, *Clays, *Adsorption, *Trace elements, Sediments, Chemical properties, Water chemistry, Sampling, Data collections, Statistical methods, Regression analysis.
Identifiers: *Marine mud-fresh mud differences.

A wide sampling of 82 modern marine and freshwater muds was analyzed for B, Cr, Ga, Ni, V, clay, clay minerals, calcium carbonate, and organic carbon. Results show that total B is highly correlated with the amount of clay; for a given clay content, modern marine muds contain about 30-45 ppm more B than modern freshwater muds. Illite has little if any control on B concentration in muds. A discriminant function based on B and clay was found to be the most practical and effective combination for distinguishing between modern marine and freshwater environments. If a single differentiator is used, B is superior to clay content. The elements Cr, Ga, Ni, and V are not collectively good differentiators; clay minerals, calcium carbonate and organic carbon also fail to distinguish the 2 environments effectively. Data support the theory of Levinson and Ludwick (1966) that B in modern marine muds increases progressively seaward from a strandline as the amount of total clay increases. (Knapp-USGS)

FORMATION OF HYDROXY-AL AND -FE INTERLAYERS IN MONTMORILLONITE AND VERMICULITE: INFLUENCE OF PARTICLE SIZE AND TEMPERATURE,
Geological Survey, Washington, D.C.
D. D. Carstea.
Clays and Clay Minerals, Vol 16, p 231-238, 1968. 8 p, 3 tab, 30 ref.

Descriptors: *Clay minerals, *Aluminum, *Iron, *Montmorillonite, Particle size, Temperature, X-ray diffraction, Analytical techniques, Cation exchange, Spectrophotometry, Acidity, Moisture uptake, Mineralogy.
Identifiers: *Hydroxy-interlayer formation, Vermiculite.

This paper describes the influence of temperature and particle size upon the formation of synthetic hydroxy-Al and -Fe interlayers and shows applications to natural conditions in expanding clays. Hydroxy-Al and -Fe interlayers were prepared in 'mono-mineralic' fine and coarse clay montmorillonite and coarse clay and silt vermiculite at 3 deg C and 21 deg C. At comparable particle size and regardless of temperature, the amounts of hydroxy-Al and -Fe interlayers in montmorillonite exceeded by far those formed in vermiculite. Likewise, the aluminum systems exhibited a higher degree of interlayering than iron systems. Within montmorillonite, the amount of hydroxy-Al and -Fe interlayers increased as the particle size decreased, regardless of temperature. Within vermiculite systems equilibrated at 3 deg C, more hydroxy-Al interlayers were recorded in coarse clay than in silt fraction, whereas at 21 deg C about equal amounts of interlayers were formed. By contrast, hydroxy-Fe interlayer was favored by the silt fraction at both temperature levels. The formation of aluminum interlayers in both minerals increased with increasing temperature. The formation of hydroxy-Fe interlayers in montmorillonite was generally not temperature dependent, whereas the formation of such interlayers in vermiculite increased slightly with increasing temperature.

CALCIUM CARBONATE INTERACTION WITH ORGANIC COMPOUNDS,
Lehigh Univ., Bethlehem, Pa. Marine Science Center.
Erwin Suess.
Available from the Clearinghouse for Sci and Tech Inf as AD-676 524 at $3.00 in paper copy or $0.65 in microfiche. A dissertation presented to the Grad Fac of Lehigh Univ in candidacy for Degree of Doctor of Phil in Geol Sci 1968. 153 p, 31 fig, 18 tab, 132 ref.

Descriptors: *Calcium carbonate, *Organic compounds, Carbonate rocks, Carbonates, Limestones, Seawater, Aqueous solutions, Aggregates, Environment, Phosphorus, Calcite, Diagenesis, Mineralogy, Adsorption, Organic matter, Deep water, Sediments, Connate water, Equilibrium, Dolomite, Hydrogen ion concentration, Free energy, Boundaries (Surfaces).
Identifiers: *Chemical processes, Albumin, Stearic acid, Aragonite, Concentration effects, Temporal effects, Monolayers, Half-layers, Surface-free energy, Calcite, Seawater ratios, Surface effects.

Dissolved organic compounds interact with surfaces of calcium carbonate minerals effecting equilibration between solution and solid. Demonstrable associations are: stearic acid and calcite and dolomite; albumin with aragonite, calcite, and magnesium-calcite. Carbonate minerals in hexane adsorb stearic acid with monolayer formation on calcite surfaces and half-layers on dolomite surfaces. Interaction is restricted to calcium sites of

solids and carboxyl acid groups. In aqueous solution, stearic acid adsorbed on carbonate mineral surfaces is insufficient to form a monolayer. Hydrated surface complexes are sufficient to cover surfaces of these minerals. Low aqueous concentrations of albumin form monolayers on carbonate minerals; greater concentrations, increasing time and pH, multilayers or non-oriented aggregates form on calcite and aragonite surfaces. Organo-carbonate associations affect calcium carbonate equilibrium by physically isolating mineral surfaces, and by reducing surface-free energy of solids. Organic compounds containing phosphorus influence calcite-seawater interaction. At low calcite to seawater ratios (C/SR) adsorbed surface-active organic matter (stainable with methylene blue) is visible on calcite surfaces. At high C/SR, seawater is depleted of surface-active organic matter, equilibrating inorganically with carbonate minerals. Surface seawater, deep water, and interstitial water equilibrate inorganically at different C/SR, which are constant for each sample, whether equilibrium is approached from under- or oversaturation. (Simsiman-Wisconsin)

PERSISTENCE OF DIAZINON AND ZINOPHOS IN SOIL: EFFECTS OF AUTOCLAVING, TEMPERATURE, MOISTURE, AND ACIDITY,
Western Washington Research and Extension Center, Puyallup.
L. W. Getzin.
Journal of Economic Entomology, Vol 61, No 6, p 1560-1565, Dec 1968. 8 fig, 3 tab, 11 ref.

Descriptors: *Diazinon, *Soils, *Insecticides, Persistence, Temperature, Moisture, Acidity, Microorganisms, Hydrogen ion concentration, Water pollution effects, Water pollution sources, Degradation (Decomposition), Biodegradation, Organophosphorus pesticides, Gas chromatography.
Identifiers: *Zinophos, *Autoclaving effects, *Thermal effects, *Moisture effects, *Chemical processes, Sultan silt loam, Acidophilic organisms, Basiphilic organisms.

Effects were studied of autoclaving, temperature, moisture, and pH on diazinon and Zinophos persistence in a Sultan silt loam. Nonbiological degradation mechanisms were primarily responsible for breakdown of diazinon. Half-life of diazinon was 5 weeks in nonautoclaved soil and 6 weeks in autoclaved soil. Zinophos was degrated to a greater extent by microorganisms than diazinon. Half-life of Zinophos in the autoclaved and nonautoclaved soil was 9 and 2 weeks, respectively. Higher temperatures and soil moisture levels accelerated decomposition of both insecticides. The persistence of both insecticides was also influenced by soil pH but through different mechanisms. Nonbiological degradation of diazinon was shown to increase with increasing acidity, while pH had no effect on non-biological decomposition of Zinophos. However, biological decomposition of Zinophos was minimal at pH 5.5, increasing at higher and lower pH values; these data suggest that basiphilic and acidophilic organisms possess the capacity to degrade Zinophos. Attempts to show that soil accelerates the nonbiological decomposition of these insecticides were unsuccessful. (Graetz-Wisconsin)

DYNAMICS OF PHYSICOCHEMISTRY IN A LARGE RESERVOIR,
Alabama Agricultural Experiment Station, Auburn.
J. M. Lawrence.
IN Reservoir Fishery Resources Symposium, Apr 5-7, 1967, Athens, Georgia, p 100-113, Nov 1968. 6 fig.

Descriptors: *Water chemistry, *Physicochemical properties, *Reservoirs, Currents (Water), Stratification, Thermocline, Oxygen, Circulation, Magnesium, Calcium, Water pollution, Density currents, Limnology, Dye releases, Water pollution sources, Hardness (Water), Iron, Carbon, Alabama, Georgia.
Identifiers: Walter F George Reservoir (Ala-Ga), Lake Eufaula (Ala-Ga).

Data are presented on stratification, density currents, dissolved oxygen content, total hardness, total iron concentration, and total carbon in Walter F George Reservoir (Lake Eufaula) during 1965 and 1966. Thermal and chemical stratification occurred during summer months, although partial or complete mixing occurred at least four times during both years after periods of cool, rainy weather. Retarded bottom currents, due to low-stream flow, facilitated stratification, and density currents existed in some regions when stratification prevailed. Use of fluorescent dye indicated that a causeway-type bridge caused upstream flowing currents. Total hardness was relatively low; the concentration of magnesium was fairly constant, while calcium concentration varied considerably among sampling sites. Concentration of total iron appeared to be associated with suspended particles. Concentrations of total carbon was high in one area due to organic pollution in 1965, but the source was largely eliminated by 1966. (Byrnes-Wisconsin)

ANALYSIS AND OPTIMIZATION OF A REVERSE OSMOSIS PURIFICATION SYSTEM--PART II. OPTIMIZATION,
Kansas State Univ., Manhattan. Inst. for Systems Design and Optimization.
L. T. Fan, C. Y. Cheng, L. Y. S. Ho, C. L. Hwang, and L. E. Erickson.
Desalination, Vol 6, No 2, p 131-152, June 1969. 5 fig, 9 tab, 8 ref.

Descriptors: *Water purification, *Optimization, *Reverse osmosis, *Mathematical models, *Recirculated water, *Operating costs, Membrane processes, Design, Capital costs, Flow characteristics, Brines, Water supply.
Identifiers: Multistage operation, Flow-work exchanger.

A mathematical model of a reverse osmosis water purification system that could be used in process optimization studies had been developed in Part I of this study. In this part, the model was used to determine design and operating variables of the system, which minimized the cost of water production. Several three multistage reverse osmosis systems were considered. They were (1) a multistage operation without the use of a flow-work exchanger and with a variable membrane area at each stage, (2) a multistage operation without the use of a flow-work exchanger and with equal membrane at each stage, and (3) a multistage operation with the use of a flow-work exchanger and with variable membrane area at each stage. In the optimization study, the recirculation rate in each stage, the brine composition leaving each stage, the ratio of membrane area to feed at each stage, and the operating pressure in each stage were controlled to arrive at a minimum water production cost. The study showed that the method presented could be used to accomplish optimum designs of complex processes requiring the simultaneous optimization of several variables. (Thiuri-Cornell)

EXPERIMENTAL STUDY OF SLURRY SEPARATORS FOR USE IN DESALINATION,
Massachusetts Inst. of Tech., Cambridge. Dept. of Mechanical Engineering.
Joseph Shwartz, and Ronald Probstein.
Desalination, Vol 6, No 2, p 239-266, June 1969. 15 fig, 1 tab, 6 ref.

Descriptors: *Slurries, *Mathematical models, *Desalination processes, Optimization, Brines, Ice, Salt balance, Fresh water, Feasibility, Productivity.
Identifiers: Freeze-distillation process, Counterwashers.

A mathematical model was developed and used to investigate the characteristics and performance of laboratory scale counterwasher slurry separators. The separators were of a type related to those used for the separation of brine from ice crystals in the freeze-distillation process. Polyethylene particles were used in the experiments to simulate the ice crystals. One of the main purposes of the experiments was to check out a model and the theory of such counterwashers previously developed by the authors. The experiments demonstrated the validity of the theoretical conclusions and helped to establish the optimal operating conditions for high production rates, sufficiently low salt content in the product and minimum loss of fresh water. The feasibility of obtaining high rates of crystal washing was demonstrated. The highest steady production rate obtained in the experiments was equivalent to 8000 lbs/hr ft of brine-free ice in the freeze-distillation process. This rate, however, was shown to be well below the maximum obtainable. (Thiuri-Cornell)

THE OPTIMUM TEMPERATURE FOR THE OPERATION OF A NON-SCALING MULTI-STAGE FLASH EVAPORATOR PLANT,
California Univ., Richmond. Sea Water Conversion Lab.
Lester H. MacLeod, Abraham Gendel, and Ahmed F. ElSahrigi.
Sea Water Conversion Lab Rep No 63-1, Jan 1963. 42 p, 10 fig, 20 ref.

Descriptors: *Flash distillation, *Optimization, *Temperature control, *Sea water, *Mathematical models, Systems analysis, Economics, Thermodynamic behavior, Scaling, Fresh water.

A multi-stage flash distillation plant offered one of the most economical means of converting sea water to fresh water and was therefore, chosen as the subject of an optimization study. Mathematical equations were established which allowed the determination of the cost of heat, pumping power and heat exchanger surface per unit of product. Evaluation of these equations, in the absence of experimental sea water data beyond 212 deg F, required some extrapolation of sea water properties, using well established thermodynamic relationships. Based on this data, and the assumption of a non-scaling system, it was concluded that the optimum temperature of the feed stream leaving the heater lies between 350 deg and 400 deg F, and that, by operating with this optimum temperature, it was possible to reduce the cost per thousand gallons of product by $0.10 to $0.15 below the cost for a plant with corresponding temperature of 210 deg F. (Thiuri-Cornell)

3B. Water Yield Improvement

OPTIMIZATION OF THE LONG-TERM OPERATION OF A SINGLE-PURPOSE RESERVOIR,
Belgrade Univ. (Yugoslavia).
Slavoljub Jovanovic.
Proc, Int Hydrol Symp, Vol 1, Colo State Univ, p 422-429, Sept 1967. 8 p, 3 fig, 6 ref.

Descriptors: *Optimization, *Reservoir operation, *Markov processes, *Linear programming, *Long-term planning, Optimum development plans, Dams, Storage capacity, Hydroelectric plant.
Identifiers: Single-purpose reservoir, Howard's algorithm.

The analysis of an optimum operating policy for a single-purpose reservoir was presented. It was assumed that water could be released from the dam through different alternatives (decisions) and that sequential decisions formed an operating policy. Linear programming and Markov chain techniques were used for selecting the policy which maximized the average release of water from the dam in long term operation. Howard's algorithm made it possible to find the optimum policy by means of relatively low number of iterations. The model was applied to a storage hydroelectric plant as an example. (Thiuri-Cornell)

A WATER YIELD MODEL DERIVED FROM MONTHLY RUNOFF DATA,
Office of Tributary Area Development, Knoxville, Tenn.
Willard M. Snyder.
World Meteorol Organ Int Ass Sci Hydrol Symp, Berkeley, p 18-30, Aug 1963. 13 p, 2 fig, 3 tab, 4 ref.

Descriptors: *Water yield, *Mathematical models, *Streamflow, *Watershed management, *Rainfall-runoff relationships, Least squares method, Numerical analysis, Optimization, Evaporation pans, Seasonal.

A mathematical model was developed to analyze past records of streamflow and to predict dependable yield for watersheds under varying patterns of rainfall. The model contained three parts: (1) a seasonal rainfall function that generated potential runoff in tow phases; immediate and delayed, (2) a distribution function that delivered the delayed runoff to future streamflow, and (3) a time-trend function that compensated for changing watershed conditions. Ten test sets of data were analyzed. The model was fitted to the data by composite techniques of non-linear least squares and component analysis. This method of numerical analysis produced consistent results. Seasonal losses corresponded closely in both magnitude and phasing to expected values based on pan evaporation. The time-trend function did not produce satisfactory results. The yield study was an effort to produce another tool or measuring technique that was necessary for optimum and unified development. (Thiuri-Cornell)

A HYDROGEOPHYSICAL SURVEY FROM KAWAIHAE TO KAILUA-KONA, HAWAII,
Hawaii Univ., Honolulu. Water Resources Research Center.
William M. Adams, Frank L. Peterson, Surendra P. Mathur, Larry K. Lepley, and Clifton Warren.
Available from the Clearinghouse as PB-187 520, $3.00 in paper copy, $0.65 in microfiche. Hawaii Water Resources Research Center, Technical Report No 32. Sept 1969. 156 p. OWRR Proj B-011-HI.

Descriptors: Hydrogeophysical, Aeromagnetic, Infrared, Audiomagnetotellurics, Electrical resistivity, Thermal anomalies, Brackish water, Basal groundwater, Resistivity profiling, Hawaii, Kawaihae, Kailua-Kona, Reconnaissance, Development.

Several geophysical surveys have been conducted over the coastline area between Kawaihae and Kailua-Kona for the purpose of locating the optimum sites for possible development of groundwater from the basal lens. A low-level aeromagnetic survey over the area and an infrared scanning effort along the coast with surface verification provided general reconnaissance information. Audiomagnetotelluric and D. C. electrical resistivity profiles defined more detailed, local structures. The infrared scanning survey along the coastline did not reveal any thermal anomalies that are reasonably attributable to previously unknown outflows of brackish water of magnitudes adequate for currently anticipated commercial exploitation. However, the aeromagnetic and audiomagnetotelluric surveys locate four lines which are possible barriers to lateral movement of basal ground water. The D. C. electrical resistivity profiling was conducted at an elevation of about 100 feet or less. Based on the resistivity data, three possible sites are selected -- two are in the north near Puako Bay and the other is above the present Kona Airport.

VILLAGE WATER SUPPLY INVESTIGATION, TERRITORY OF PAPUA AND NEW GUINEA,
Bureau of Mineral Resources, Geology and Geophysics, Canberra (Australia).
J. P. MacGregor, and J. R. L. Read.
Eng Geol, Vol 3, No 3, p 217-232, July 1969. 16 p, 5 fig, 3 ref.

Descriptors: *Water supply, *Municipal water, *Domestic water, *Water resources development, Water wells, Aquifers, Water quality control, Canals, Wellpoints, Water yield.
Identifiers: *New Guinea.

The Territory of Papua and New Guinea has water supply problems despite its relatively high rainfall. The population lives mostly in villages and obtains its drinking water from streams and wells that are subject to pollution and drought. A Village Water Supply Survey Team was set up to review the present position district and make recommendations for the development of water supplies. Any village water supply scheme recommended must be cheap to install and maintain and should provide an adequate supply of fresh water which cannot readily be polluted. Deep drilling is too expensive to provide a solution at this stage of development. It has been found that supplies of fresh water can be obtained in, or near, most villages and settlements by sinking a protected large diameter well or by tapping a sandy aquifer. Water from surface streams can be gravitated to a village in appropriate situations provided bacterial contamination can be avoided. Where suitable groundwater cannot be located an artificial rainwater catchment and storage is generally the best alternative. (Knapp-USGS)

OPTIMIZATION TECHNIQUES IN WEATHER MODIFICATION,
Denver, Colo.
P. J. Stinson.
Proc Ser No 5, Proc Nat Symp Analysis Water-Resour Syst, p 79-94, July 1968. 16 p, 8 fig, 11 ref.

Descriptors: *Weather modification, *Optimization, Water requirements, Water resources, Dry ice, Technology, Precipitation (Atmospheric), Legal aspects, Meteorology, Mathematical models, Simulation, Systems analysis, Social aspects, Economics, Mathematics, Cloud seeding, Silver iodide, Weather data, Nucleation, *Operations research, Atmospheric physics.
Identifiers: Cloud modification, *Atmospheric research, Ice crystals, Nuclei generators, Systems engineering.

Precipitation management research programs offer a complex system including scientific and engineering developments and much human ingenuity. Maximum effectiveness can be achieved best through the optimization of a sequence of processes and their interactions including: (1) cloud systems, (2) cloud treatment systems, (3) experimental design and statistical evaluation of precipitation data, (4) computer simulation and mathematical modeling, and (5) the total system. Each optimization process in the sequence produces a beneficial result and in combination with other processes in the sequence produces the most effective enhancement of water supply. The ultimate system involves a scientific, interdisciplinary approach including systems engineering, systems analysis, and other operations research techniques. (USBR)
W70-01122

THE LAND AND WATER USE SURVEY OF NORTH-CENTRAL KORDOFAN (1961-66),
London Univ. (England). School of Oriental and African Studies.
J. H. G. Lebon.
Geographical Journal, Vol 134, No 4, Dec 1968, p 546-550. p 5, 14 ref.

Descriptors: *Arid lands, *Grazing, *Surveys, Social impact, Maps, Grasslands.
Identifiers: *Sudan, *Kordofan, *Catchments, Africa.

The article reviews a series of F.A.O. reports on land and water use in Kordofan Province, Republic of Sudan. Kordofan is located in the drier savanna zone of Africa which has a severely limited perennial water supply. The area is economically retarded, with both grazing and the limited agriculture tending to concentrate in the few areas where water is available perennially. Hence, pasture and soils are deteriorating. Work is underway to develop catchment and cistern systems for the drier northern area where no subsurface water is available. Some of the area does support the well adapted Acacia senegal and research is underway to improve output of gum arabic. The reports present general maps of resources of the area and review practices of the largely pastoral and nomadic tribes that inhabit it. These may serve as bases for future resource and social research and development. (Crouse-Arizona)

WATER SUPPLIES IN SOUTH AUSTRALIA,
Hull Univ. (England). Dept. of Geography.
Peter Crabb.
Geography, Vol 53, No 3, 1968, p 282-293. 12 p, 4 fig, 6 tab, 16 ref.

Descriptors: *Arid lands, *Irrigation, *Water resources development, *Water transfer, *Reservoirs, Water supply, Consumptive use, Municipal water, Rivers, Desalination.
Identifiers: *Australia, *South Australia, River Murray.

Four-fifths of South Australia has an average precipitation of less than 10 inches. A long term

development program, reviewed in this paper, has made essentially unrestricted water use available to most of the state's population of over one million. An intricate system of diversions, reservoirs, interbasin transfers and groundwater pumping started in the mid-19th century has supported continuous population and economic growth of the Adelaide metropolitan area. Problems of water supply for rural parts of the state, distant from the Adelaide Hills, are somewhat more difficult; every possible stream, intermittent or otherwise, has been exploited, including long transfers from the River Murray lying to the east. A solar distillation plant converts saline groundwater for one mining community. New storage and diversion projects along the Murray will support some additional development, but beyond that desalination of sea water will be necessary. (Crouse-Arizona)

THE WATER PROBLEM IN THE DESERTS OF THE USSR,
All-Union Research Institute for Water Engineering and Reclamation, Moscow.
L. V. Dunin-Barkovskiy.
Trans from Problemy Osvoyeniya Pustyn, No 1, 1967, p 13-22. Soviet Geography: Review of Translation, Vol 9, No 6, 1968, p 458-468. 11 p, 7 ref.

Descriptors: *Arid lands, *Irrigation programs, *Salinity, *Water improvement, *Deserts, Weather modification, Drainage systems, Phreatophytes, Evaporation control, Saturated soils, Desalination.
Identifiers: *USSR.

The author reviews existing and planned irrigation projects in arid and semiarid regions of the USSR. There is great potential for irrigation based on water from rivers transversing the vast arid region. To the west, waters of rivers such as the Volga, used largely for power generation and transportation until now, are expected to support large irrigation projects in the future. The Eastern and north eastern deserts have limited flow available for irrigation projects. Such development would require diversion of water from distant Siberian streams. In some cases desalination of present surface and groundwaters or weather modification might be reasonable alternatives. Central Asia and Kazakhstan which have 2/3 of the present irrigated land in the U.S.S.R., offer great potential with better regulation of melt water flows from the major mountain ranges. Control of phreatophytes and of evaporation from surface waters offer a real potential for improving stream flow. Water logging and salinity problems in currently irrigated areas indicate need for better drainage planning in future projects. (Crouse-Arizona)

The author presents a broad review of current knowledge and of the potential of fresh water sources in desert regions of the U.S.S.R. These could be used for watering livestock herds, herder's settlements, and suitable industrial enterprises. Intensive agricultural use in large irrigation projects, except to meet limited local needs, is generally discouraged. There is insufficient recharge in most areas to maintain such projects over the long run. One of the most promising approaches, both economically and technically, is the use of clay plans as catchments for recharge of natural aquifers or artificial storage tanks. Large areas are found to have fresh water lenses perched on deeper saline ground water. With proper development so as to prevent salt water intrusion, these could prove useful and more economical for watering livestock than deep wells requiring long lifts. Artesian sources located far from recharge areas have generally been saline. (Crouse-Arizona)

HAS RECENT LEGISLATION LIMITED PRIVATE RIPARIAN RIGHTS IN IOWA,
Keith McKinley.
Drake L Rev, Vol 8, No 1, p 59-65, Dec 1958. 7 p, 52 ref.

Descriptors: *Iowa, *Riparian rights, *Preferences (Water rights), *Water allocation (Policy), Legislation, State governments, Water rights, Artificial use, Irrigation water, Legal aspects, Natural use, Relative rights, Water law, Water utilization, Competing uses, Regulated flow, Consumptive use, Water management (Applied), Water permits, Water policy, Water supply, Withdrawal, Water demand, Water resources, Regulation, Priorities, Average flow.

Recent Iowa legislation regulating the consumptive use of water resources has not substantially changed the common law rights of private riparian owners as developed by the Iowa Supreme Court. While creating a new right in non-riparian users, the rights of riparian owners have not been limited. Riparian owners still have unlimited use of water resources for ordinary and natural uses, termed non-regulated uses by the legislature. Artificial, or regulated, use is still limited to the extent that there is to be no interference with natural uses by other riparians. Although any person may apply for a permit to withdraw water, the rights of non-riparians are clearly inferior to the rights of private riparian owners. As between two non-riparian applicants, the first in time is given priority. The new legislation preserves the common law rights of riparians, yet it provides for maximum utilization of water resources by making water available to non-riparian users for the first time. Identifiers: Seafood industry, Oyster repletion.

The counties which make up 'tidewater Virginia' are enumerated herein. The Commission of Fisheries is renamed the Marine Resources Commission. The chairman is to be appointed by the governor and must have knowledge of seafood and marine affairs. The Commissioner is responsible for enforcement of the fish and shellfish laws and those laws related to the fish and shellfish industries in the tidewaters of the state. The Commissioner, with Commission approval, may purchase or rent such equipment as may be required to perform his duties. The Commissioner is obligated to investigate all matters affecting the seafood industry and to make reports on revenues derived from the shellfish industries, the condition of those industries, and possible legislation aimed at betterment or protection of them. No employee or official of the Commission may be granted a license to engage in commercial fishing in Virginia. The Commission shall appoint civil engineers to make surveys of all oyster-planting grounds and of natural oyster beds or shoals as necessary. The Commission shall also appoint a conservation and repletion officer to head the oyster and shellfish repletion program. (Kelly-Florida)

MARINE RESOURCES COMMISSION.

Va Code Ann secs 28.1-23 thru 28.1-36 (1969).

Descriptors: *Virginia, *Marine fisheries, *Fish conservation, *Administrative agencies, Legislation, Legal aspects, Regulation, Permits, Public health, Natural resources, Shellfish, Fishing, Commercial fishing, Supervisory control (Power).
Identifiers: *Marine resources, *Seafood industry, Penalties (Criminal).

The Marine Resource Commission is authorized to make such regulations as it deems necessary to promote the general welfare of the seafood industry and to conserve and promote the seafood and marine resources of the state. The Commission may regulate the taking of seafood so long as such regulations do not conflict with the provisions of statutory law. The Commission is empowered to establish licenses for the use of devices used to take seafood commercially. Violation of Commission

regulations is punishable by criminal penalties. Regulations must be published in a specified manner before promulgation in order that public hearings can be held, except emergency regulations of limited duration may be adopted without publication where necessary for the immediate preservation of the public peace, health, safety, welfare, protection of the seafood industry, or natural resources or marine animals. The procedure at hearings on proposed Commission regulations is provided for. Judicial review of Commission decisions at the hearings and of the regulations themselves is established. (Keith-Florida)
W70-01162

SURVEYS OF AND RIGHTS IN OYSTER GROUNDS.

Va Code Ann secs 28.1-100 thru 28.1-107 (1969).

Descriptors: *Virginia, *Oysters, *Administrative agencies, *Surveys, Maps, Mapping, Shellfish, Commercial shellfish, Commercial fishing, Beds under water, Conservation, Shoals, Bays, Legislation, Regulation, Jurisdiction, Local governments, Legal aspects.
Identifiers: Oyster beds.

The Baylor Survey, which is the official survey of oyster grounds in this state, may be changed or resurveyed by the Commission of Fisheries. Copies of Commission maps showing oyster grounds must be filed with the clerk of the county or city having jurisdiction over the respective underwater areas. If a surveying mistake places part of an oyster-planting ground in a natural oyster bed, the leaseholder of the planting grounds may remove his oysters upon obtaining Commission approval. Oyster grounds should be designated by prominent markers. It is unlawful to remove any oyster-ground markers or for any person other than the leaseholder to remove oysters from an oyster ground. (McDonough-Florida)
W70-01163

LEASING OYSTER-PLANTING GROUNDS.

Va Code Ann secs 28.1-108, 28.1-109 (1969).

Descriptors: *Virginia, *Riparian rights, *Oysters, *Commercial shellfish, Commercial fishing, Administrative agencies, Surveys, Bays, Bodies of water, Legislation, Leases, Fisheries, Fish management, Rivers, Legal aspects, Water law.
Identifiers: Oyster beds.

Riparian owners owning land bordering on oyster-planting areas may apply for oyster grounds in front of their land. The leasing of oyster grounds is recorded, and the leasehold of a riparian owner passes with the sale or transfer of the riparian land. State residents, firms, and domestic corporations in the oyster business may lease oyster grounds from the Commission of Fisheries. Applications for leases should state the location and number of acres of the oyster ground desired. Except in the Chesapeake Bay, no single assignment of oyster grounds may exceed two hundred fifty acres, and no combined allotment to any person, firm, or corporation may exceed three thousand acres. Leases are for twenty years and may be renewed. Leaseholders' rights to oyster grounds are subject to riparian rights and fishing rights. (McDonough-Florida)
W70-01164

TRANSFER OF OYSTER-PLANTING LEASES; RIGHTS OF RIPARIANS.

Va Code Ann secs 28.1-110 thru 28.1-118.1 (1969).

Descriptors: *Virginia, *Oysters, *Commercial shellfish, *Riparian rights, Leases, Administrative agencies, Local governments, Navigation, Highways, Legislation, Legal aspects, Oysters, Eminent domain, Conservation, Fisheries, Fish management, Water law, Beaches, Ownership of beds, Beds.
Identifiers: Oyster-planting grounds.

No person may use natural oyster grounds or bottoms not assigned to him. Lease-holders of oyster-planting grounds may transfer or assign their leases to state residents and domestic corporations in the oyster business. A transfer creates a new twenty-year lease and includes the balance of time remaining under the assigned lease. The Commission of Fisheries may decide not to collect rents for oyster grounds in disaster areas for oyster culture. The state highway and conservation departments and municipalities have eminent domain rights to any oyster bottoms within their respective jurisdictions. Riparian owners owning land surrounding creeks, coves, or inlets less than one hundred yards wide have exclusive shellfish-planting rights to the bottom. Leaseholders may erect oyster watchhouses that do not obstruct navigation. Leases to oyster grounds are subject to the rights of riparian owners wishing to build bulkheads or wharves in front of their land. Any person may apply to the Commission for a permit to establish a bathing beach. (McDonough-Florida)
W70-01165

CULLING OYSTERS.

Va Code secs 28.1-124 thru 28.1-127 (1969).

Descriptors: *Virginia, *Oysters, *Commercial shellfish, *Administrative agencies, Legislation, Commercial fishing, Conservation, Fish management, Legal aspects, Size, Public rights, Shellfish, Regulation, Control.

Oysters taken from public, natural oyster beds must be culled at the place of taking. Shells under the statutory length must be replaced. It is unlawful to buy, sell, or possess oysters under the prescribed size. Catchers violating oyster size requirements may be required to scatter their entire cargo onto the public oyster rocks or post a cash bond. Throwing oysters or shells overboard (other than in the ordinary process of culling) upon the approach of an oyster inspector is evidence of violation of this chapter. (McDonough-Florida)

A PHYSICAL AND ECONOMIC ANALYSIS OF ALTERNATIVE IRRIGATION METHODS IN A SUB-HUMID CLIMATE,
North Dakota State Univ., Fargo.
E. C. Stegman, G. A. Johnsgard, A. Bauer, and D. O. Anderson.
Available from the Clearinghouse as PB-187 684, for $3.00 in paper copy, $0.65 in microfiche. Research Project Technical Completion Report, Sept, 1969. 60 p, 16 tab, 12 fig, 72 ref. OWRR Proj B-007-NDAK.

Descriptors: *Irrigation system design, *Alternative irrigation methods, Irrigation program simulation, Crop production functions, Irrigation economic analysis, Irrigation.

The question of on-farm system investment levels which are needed to produce near optimum returns is a difficult and relevant design problem for irrigation system planners. This question is particularly relevant to many humid and sub-humid areas where crops can be profitably produced without irrigation. The methodology of this project has centered upon the development of computational models which simulate in detail the operation of specific types of sprinkler irrigation systems. These models are being applied to the long term climatic record of a test area (Oakes Irrigation District of North Dakota) to compute probability distributions of parameters (i.e. number of irrigations, days of system operation, acre inches of water pumped, crop yield potential, etc.) which may be utilized to evaluate the physical and economic potential associated with specific system types, capacities, and imposed management regimes. The computational models are being applied to combinations of physical parameters (soils, crops, and irrigated unit size) which are expected to be representative of the test area during early stages of irrigation development. Relevant cost and return functions may then be applied for economic analysis either as a second phase to this project or at such time a planner is in need of such analysis. This report describes the development of the computational models and associated analyses relative to the test area and the selection of model inputs. These analyses include: (1) The identification and selection of physical conditions representative of the Oakes Irrigation District; (2) The development of crop production functions; (3) The development of computer simulation models for specific sprinkler system types; (4) Example model applications.

NEW WATER BIRD FOR EGYPT: A ROBOT SHADOOF,
Rand Corp., Santa Monica, Calif.
Richard Murrow.
Ekistics, Vol 24, No 142, p 256-260, 1968. 5 p, 2 fig.

Descriptors: *Arid climates, *Irrigation operation and maintenance, *Water conveyance, *Farm equipment, Irrigation efficiency.
Identifiers: *Egypt, *Shadoof.

The shadoof is an ancient and simple man-operated fulcrum device which lifts water from an irrigation canal into the irrigated field. It is the most preferred irrigation device in Egypt but is enormously wasteful of man power. The common toy 'drinking bird' alternately bobs forward into drinking position, then returns to erect standing position in an endless cycle. This engine requires virtually no service or attendance and involves little frictional wear to create demands for lubrication or replacement. High Nile Valley temperatures offset by drying winds should keep a 'bird' going virtually indefinately. The author added a tube with a scoop near the head which would scoop up water as from a canal and carry it backward through the tube to be dumped into another container at a higher level, such as the Egyptian field. A laboratory model seven feet in length using Freon 11 as the internal working fluid has performed successfully. Using proper materials such an engine could be built for a cost of $50 to $100, be portable, and perform efficiently the work of a man scooping up water each day. (Crouse-Arizona)
W70-01205

ESTIMATION OF GRAZING CAPACITY ON ARID GRAZING LANDS,
Soil Conservation Service, New South Wales.
R. W. Condon.
IN G. A. Stewart, Ed., Land Evaluation, Papers of a CSIRO Symposium Organized in Cooperation with UNESCO, Macmillan of Australia, p 112-124, Aug 26-31, 1968. 13 p, 4 fig, 7 ref.

Descriptors: *Arid lands, *Grazing, *Land classification, *Rainfall, *Pasture management, Soil types, Topography, Soil-water-plant relationships, Carrying capacity, Range management, Stocking, Estimating.
Identifiers: *Australia, *New South Wales, Vegetation density.

The author describes a method developed for estimating safe grazing capacity for arid lands in Australia. Rating scales were established for factors influencing grazing capacity. Those factors increasing capacity were given a plus rating; those with an adverse effect, a penalty rating. It was necessary to establish the capacity for a base or standard land class and rating scales for the factors that would influence variance from the standard unit. Such factors as soils, topography, and density of woody species were rated, but the most important single variable was average annual rainfall. (Crouse-Arizona)
W70-01206

COMMUNITY IRRIGATION PROJECTS IN THE WAIKERIE DISTRICT OF SOUTH AUSTRALIA,
Hull Univ. (England).
P. Crabb.
Geography, Vol 52, No 4, p 412-415, Nov 1967. 4 p, 1 fig, 2 tab.

Descriptors: *Arid lands, *Sprinkler irrigation, *Horticultural crops, Salinity, Drainage, Evaporation, Irrigated land, Irrigation programs, Citrus fruits.
Identifiers: *Australia, *Murray River, South Australia.

Over 3,000 acres of the Waikerie District of South Australia have been irrigated since 1960. This land is well above the river level and in no danger of being flooded as had been earlier developed low lands. The area of deep sandy soils is not suited to furrow-irrigation; therefore, a sprinkler irrigation system has been developed. Irrigation is managed on a community cooperative basis rather than by individual land holders. Most of the land is in orchards with some vineyards, and vegetables presently grown among the developing fruit trees. Much of the land is controlled by absentee owners but with resident managers. There are some difficulties with periodic salinity of Murray river waters causing leaf poison and potential drainage problems, resulting in decreased production and fluctuation in the fruit market. However, the author concludes that undoubtedly the projects will be technically and economically successful. (Crouse-Arizona)
W70-01207

THE KHASHM EL GIRBA IRRIGATION SCHEME: A NEW SOCIO-Economic project in the sudan,
Khartoum Univ. (Sudan).
Mutwakil A. Amin.
Professional Geographer, Vol 21, No 3, May 1969, p 150-152. 3 p, 1 fig, 2 ref.

Descriptors: *Semiarid climates, *Irrigation programs, Rural sociology, Economics, Social aspects, Relocation, Agriculture, Dam construction, Rotations, Cotton, Land tenure, Sugarcane, Wheat.
Identifiers: *Sudan, Aswan High Dam.

The article briefly describes relocation of a Nubian community flooded by the Aswan High Dam to semiarid land east of Khartoum. Since rainfall occurs within a month period, a diversion dam with an irrigation project was developed to conserve water and sustain the relocated group of some 32 thousand persons. The soil was a deep fertile clay which with addition of a dependable water supply appears to be able to support a viable agricultural community based on cotton and sugar for export and wheat and vegetables for local consumption. Ownership and farm management activities are divided between settlers and the government according to availability of capital and technical abilities. The settlers are grouped into several villages in an attempt to preserve their former social structures. (Crouse-Arizona)

REGIONAL AND SEASONAL WATER SUPPLY IN THE TARIM BASIN AND ITS RELATION TO CULTIVATED LAND POTENTIALS,
Hawaii Univ., Honolulu.
Herold J. Wiens.
Assn of Amer Geographers, Annals, Vol 57, No 2, June 1967, p 350-366. 17 p, 1 tab, 3 fig, 61 ref.

Descriptors: *Arid lands, *Irrigation programs, *Melt water, *Water yield improvement, *Low-flow augmentation, Agriculture, Salinity, Evaporation, Irrigation canals, Channeling, Drainage programs, Flow rates, Flow control, Rice, Wheat, Glaciers, Snow melt, Deserts, Water resources development.
Identifiers: *China, *Sinkiang, *Tarim basin, Timing (Flow), Oases.

The Tarim Basin in Sinkiang is one of the more important areas where China's Communist regime is finding that application of efficient technology can be effective in increasing usable land and conserving irrigation water. Since rainfall averages less than two inches per year, agriculture depends upon irrigations from glacier and snow melt from the high surrounding mountains. Streams flowing from the mountains carry an annual flow estimated at about 89 billion cubic meters. This is a basis for an estimate of potential limit on agricultural production in the Basin. Summer flows account for fifty to eighty percent of the annual flow. Because of inadequate storage and poor drainage in many irrigated areas, full potential of the water supply has not been realized. Much water is lost to evaporation. Developed cropland in 1963 was seven million acres. With improved technology a potential of 11 million acres is estimated. (Crouse-Arizona)
W70-01210

THE DEVELOPMENT OF THE IRRIGATION ECONOMY OF MENDOZA, ARGENTINA,
Glasgow Univ. (Scotland).
Arthur S. Morris.
American Association of Geographers, Annals, Vol 59, No 1, Mar 1969, p 97-115. 19 p, 10 fig, 30 ref.

Descriptors: *Arid lands, *Irrigated land, *Land tenure, *Economics, *Agriculture, Irrigation efficiency, Diversion dams, Canal seepage, Groundwater, Deep wells, Water costs, Vine crops, Agronomic crops, Water law.
Identifiers: *Argentina, *Agricultural development, Mendoza.

The area around Mendoza in western Argentina is extremely arid but has experienced agricultural development based on irrigation using both surface and groundwater originating in the nearby Andes. The area near Mendoza is the oldest in terms of agricultural development and having a longer growing season, is devoted to vineyards. The farms tend to be small and technologically backward. Share cropping with short-term tenancy is common. Water is supplied by canals from diversion dams, with the amount of water determined by natural river flow. These factors discourage long term investment in technological improvement on crop diversification. More recently developed outlying areas, while less favored by climate, have tended toward more stable ownership of larger holdings, technological improvements and crop diversification. These lands depend to a large extent upon modern wells, which are costly but assure a more dependable supply of water. The landowner is encouraged to invest in technology and diversified crop varieties that will make the most economical use of his water. Recent beginning of large storage dams will probably lead to further development of modern agriculture. (Crouse-Arizona)
W70-01213

TRICKLE IRRIGATION -- A PROMISING SECOND TOOL FOR A BREAKTHROUGH IN FOOD PRODUCTION IN TROPICAL, SUBTROPICAL AND DESERT AREAS,
Food and Agriculture Organization of the United Nations, Bangkok (Thailand).
B. D. van't Woudt.
International Commission on Irrigation and Drainage Bull, p 88-96, July 1968. 7 p, 2 fig, 1 tab, 8 ref, append.

Descriptors: Irrigation, *Irrigation systems, *Irrigation practices, *Hydroponics, *Fertilizers, Crops, Crop production, Saline water, Costs, Drops (Fluids), Foreign research, Agriculture, Agronomic crops, Soil moisture, Agronomy, Salinity, Automatic control.
Identifiers: Israel, Saline agriculture, Trickle irrigation.

A method developed in Israel through which a water-fertilizer mix is continuously dripped on the soil at the base of a crop plant under field conditions is discussed. Noncorrosive plastic tubes are placed on the ground next to the base of crop plants; no soil levelling is required. The tubes, which can be permanent installations, continually drip water-fertilizer mix to plant roots. Control head units with water tap and filter, water meter, and fertilizer tank are located about every 5 acres. The unit requires about 2.5 gal/hr and the system takes 1 to 2.3 atm of pressure. Early results, conclusions from related work, and field observations show that this method may produce high yields, allow water of high salinity to be used, reduce drainage problems, and permit complete automation under field conditions in such a way that water and fertilizer applications meet but not exceed plant needs. Although the cost of installation varies from $1000 to $3000/ha, results may pay for this investment within a short time. (USBR)

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

FLOOD PLAIN INFORMATION, TROUT AND BIJOU CREEKS, SOUTH LAKE TAHOE, CALIFORNIA.
Corps of Engineers, Sacramento, Calif.

Corps Eng Flood Plain Rep, Jul 1969. 23 p, 7 fig, 11 plate, 8 tab.

Descriptors: *Floods, *Flood damage, *California, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: South Lake Tahoe (Calif), Standard project flood, Intermediate regional flood.

Flooding of Trout and Bijou Creeks, South Lake Tahoe, California, is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. (Knapp-USGS)

EFFECTS OF CULTIVATION AND GRASS ON SURFACE RUNOFF,
Agricultural Research Service, Coshocton, Ohio. Corn Belt Branch.
Frank J. Dragoun.
Water Resources Res, Vol 5, No 5, p 1078-1083, Oct 1969. 6 p, 2 fig, 3 tab, 8 ref.

Descriptors: Rainfall-runoff relationships, *Grasslands, *Cultivation, *Cultivated lands, *Land management, Watershed management, Soil conservation, Water conservation, Erosion control.
Identifiers: Cultivation effects ((Runoff).

Results of research show the effect of drastic changes in land use on surface runoff from 4-acre watersheds near Hastings, Nebraska. Surface runoff was significantly reduced two years after converting marginal cultivated fields to perennial grass and was equivalent to runoff from native meadow after the third year. Conversely runoff increased greatly the first year after native meadow was placed in cultivation. The significance of these results is evident in the conversion of more than a million acres of marginal cropland to permanent vegetation in the Great Plains and in the proposed conversion of many more acres. (Knapp-USGS)

DAMS.

SC Code Ann secs 18-5 thru 18-8 (1962).

Descriptors: *South Carolina, *Dams, *Administrative agencies, *Milldams, Riparian rights, Legislation, Legal aspects, Jurisdiction, Local governments, Water law, Water policy, Flood control, Floodgates, Flow control, River regulation, Water control, Water storage, Regulation, Public health, Compensation.
Identifiers: Nuisances.

Persons who construct dams which cause overflow upon the lands of another without first having obtained permission to so flood, or who let off impounded water so as to injure the crops of others are in violation of this section. No person is authorized to keep water on land other than his own. When the general health is threatened by the condition of any milldam, the county commissioners may remove the cause of such nuisance, but the owner must be paid fair compensation for such dam. Commissioners may require use of floodgates on milldams when necessary for the protection of public health or when the drainage of uplands requires same. Provisions of this section do not oust the court of general sessions of jurisdiction to abate any millpond as a nuisance. (Johnson-Florida)

AQUEDUCT ROUTE OPTIMIZATION BY DYNAMIC PROGRAMMING,
Technion - Israel Inst. of Tech., Haifa; and Water Planning for Israel Ltd., Tel Aviv. Water Supply Section.
Nathan Buras, and Ze'ev Schweig.
J Hydrol Div Proc of ASCE, Vol 95, No HY 5, p 1615-1631, Sept 1969. 2 fig, 1 tab, 9 ref.

Descriptors: *Optimization, *Aqueducts, *Routing, *Dynamic programming, *Irrigation programs, Conduits, Laterals, Pumping, Costs, Planning.
Identifiers: Teleghan Aqueduct, Ghazvin Development Project, Iran.

A regional irrigation project supplying water to a number of villages scattered over a relatively flat area was modeled by a series of straight lines across the contours, representing the laterals, and a main conduit crossing these lines. This model was further formulated as a dynamic programming search technique, which yielded the preliminary optimal route of the main conduit. The optimality criterion was minimization of total cost of the aqueduct and the laterals, including the energy necessary for pumping water from the main conduit to supply points above it. The dynamic programming formulation enabled the search for minimum cost sections of the aqueduct route, and the application of the principle of optimality insured the attainment of the overall optimum aqueduct route. This study was done in connection with the planning of the Teleghan Aqueduct, within the Ghazvin Development Project in Iran. (Thiuri-Cornell)

SIMULATION OF RUNOFF FOR DESIGN OF WATER RESOURCE SYSTEMS,
State Water Plan Development of Water Resources Management, Prague (Czechoslovakia).
Ing Zdenek Kos.
Proc, Int Hydrol Symp, Vol 1, Colo State Univ, p 283-289, Sept 1967. 7 p, 4 ref.

Descriptors: *Synthetic hydrology, *Simulation analysis, *River systems, *Water resources development, *Reservoir design, *Optimization, Hydrologic data, Irrigation practices, Multiple-purpose project, Gaging stations, Withdrawal.
Identifiers: Czechoslovakia.

Simulation studies of Czechoslovak rivers were made. The aim of the study was to choose the best combination and allocation of capacities of reservoirs to various uses in such a way as to generate the maximum net benefits. The design of the water resources system required the simulation of monthly flow records of some hydrologically related stations along with specific irrigation requirements. A multiunit multipurpose water resource system including five gaging stations, three reservoirs, a nonwithdrawal use and withdrawal consumption, was studied. Operating procedures were tested. The operation procedure with two stages of regulation proved best. As the data of the period under study (50 years) covered some critical sequences of low monthly flows and high specific irrigation requirements, the results of most studies with synthetic records gave higher net benefits than those using measured data. LOWER MISSISSIPPI RIVER BASIN DEVELOPMENT DISTRICT.

Miss Code Ann secs 5956-321 thru 5956-323, 5956-325 thru 5956-327, 5956-329, 5956-330 (Supp 1968).

Descriptors: *Mississippi, *Water conservation, *Water resources development, *Water allocation (Policy), Legislation, Legal aspects, Channels, Surface waters, Flood control, Water supply, Mississippi River Basin, Mississippi River, Federal government, Louisiana, Investigations, Feasibility studies, Cost-benefit analysis, Structures, Construction, Financing, Regulation, Planning, Eminent domain, Public utility districts, Parks, Pollution abatement, Water pollution control.
Identifiers: *Public policy, penalties (Civil).

It is declared as a matter of legislative determination that the waterways and surface waters of the state are among its basic resources; these resources have not been conserved to realize their full use; the utilization, development, conservation, and regulation of such waters are necessary for the purposes of flood control, pollution control, economic development, soil conservation, irrigation, navigation, and pollution abatement; these purposes are, as a matter of public policy, in the best public interest. The Lower Mississippi River Basin Development District is created with the power to: (1) develop in conjunction with appropriate state and federal agencies plans for public works of improvement appropriate to the purposes stated above; (2) acquire engineering surveys, feasibility studies and cost estimates relating to the construction of facilities for controlling, storing, using, and distributing the waters within the Lower Mississippi River Basin; (3) acquire, maintain, and use any property necessary for the purposes of the District; and (4)

finance its operation by specified means. Additional powers of the district include water resources allocation, construction of necessary facilities, water resources conservation, and regulation. (Keith-Florida)

FERRIES.

Ark Stat Ann secs 76-1701 thru 76-1730 (1958).

Descriptors: *Arkansas, *Navigable rivers, *Non-navigable waters, Legislation, Legal aspects, United States, Federal government, Lakes, Administrative agencies, Taxes, Safety, Permits, Regulation, Water rights, Riparian rights, Transportation.
Identifiers: *Public ferries, Tolls, Penalties (Criminal), Licensing.

All ferries over public navigable streams are deemed public ferries. Every person owning the land fronting on a public navigable stream is entitled to keep a public ferry over such stream. All lakes retained as public property by the United States are deemed public navigable streams for the purposes of this act. Specific provisions cover the licensing and taxation of ferries. The ferryman is charged with keeping the ferry in such condition as will insure the safety of his loads. Tolls are specifically regulated. Any private non-navigable stream may by court order be declared a ferry site in the public interest. (Keith-Florida)

COMMENT: EXTENDING THE APPLICATION OF THE LAW OF ACCRETIONS.

Ohio Stat L J, Vol 23, No 4, p 771-773, Fall 1962. 3 p, 22 ref.

Descriptors: *Massachusetts, *Riparian rights, *Accretion (Legal aspects), *Riparian land, Ownership of beds, Beds under water, High water mark, Low water mark, Relative rights, Recreation, Navigation, Legal aspects, Competing uses, Easements, Land tenure, Land use, Beaches, Tidal waters, Judicial decisions.

Michaelson v Silver Beach Improvement Association, 342 Mass 251, 173 NE2d 273 (1961), involved a taking of riparian land by a municipality from private owners for the purpose of creating a public recreational beach. In Massachusetts riparian owners acquire title to adjacent land between the high and low water marks, subject to a public easement for navigation and free fishing. The doctrine of accretion is also operative in Massachusetts, and plaintiff landowners claimed that the artificial creation of the beach by the municipality was analogous to accretion and that ownership of the beach, therefore, inured to plaintiffs. The Supreme Court of Massachusetts agreed with this contention, holding that unless the municipality's project was connected with navigation or fishing, the private landowner had a right to the property or to compensation by the municipality. The author considers this result just, since the theory of riparian property is to encourage the development of private access to the sea. (Kelly-Florida)

CONSTITUTIONAL LAW--COMMERCE CLAUSE--WATER RIGHTS IN THE FLOW OF A NON-NAVIGABLE STREAM ARE PROPERTY RIGHTS,
Joseph H. Widmar.
U Pitt L Rev, Vol 21, No 3, p 548-551, Mar 1960. 4 p.

Descriptors: *Non-navigable waters, *Water rights, *Appropriation, *Compensation, Relative rights, Federal government, Judicial decisions, Preferences (Water rights), Federal jurisdiction, Legal aspects, Dams, Navigable waters, Tributaries, State governments, Streams, Water law, Reservation doctrine, Federal-state water rights conflicts, Jurisdiction, Riparian rights, United States, Riparian land.

Grand River Dam Authority v United States, 175 F Supp 153 (1959), is representative of the difficulties encountered by the courts in balancing the rights of individual landowners along non-navigable streams with the right of the federal government to control navigation. The instant decision held that an individual's rights in a non-navigable stream are property rights which may not be taken by the United States without compensation. Although the trend in recent years has been towards increased governmental immunity along navigable streams, the instant case indicates that the courts are reluctant to extend this immunity to non-navigable waters. It is settled that a private individual has no compensable property rights in the flow of a navigable stream, and there appears to be no justifiable reason for treating landowners along non-navigable streams differently. Upholding such a distinction would greatly increase the cost of and hinder federal water control projects. If the governmental immunity under the commerce clause extends to the taking of water rights on navigable streams, the same reasoning should allow takings on the non-navigable tributaries. (Marsee-Florida)

FEDERAL REGULATION OF WATERWAYS.
Rocky Mt L Rev, Vol 19, No 1, p 49-64, Dec 1946. 16 p, 22 ref.

Descriptors: *Federal jurisdiction, *Navigable waters, *Water rights, *Judicial decisions, Water resources development, Governments, Federal government, Federal-state water rights conflicts, State jurisdiction, Riparian rights, Relative rights, Watershed management, Prior appropriation, Flood control, Streams, Rivers, Water resources, Water law, Navigation, Navigable rivers, Rivers and Harbors Act, Tributaries, River systems, Legal aspects.

The federal government has asserted increasing control over streams and rivers through the Constitution's commerce clause. Congress has the power to regulate interstate commerce on navigable waterways. An early Supreme Court case held that rivers which are navigable in fact are navigable in law. Navigable in fact means susceptible of being used, in their ordinary condition, as highways of commerce. A later case expanded this test so that any stream which may at any time have borne any sort of navigation, in any form, may be termed a navigable waterway. And further, any stream or watershed which contributes to such navigable waterway is subject to federal regulation of commerce. Another Supreme Court decision held that whenever the profits of flood control exceed the costs, federal regulation of tributaries and watersheds is permitted, for watersheds are a key to flood control. The principal corollary effect of these cases is upon the water rights involved. Since water rights are not fifth amendment property and are subject to a dominant public interest in navigation, these rights on almost every stream are subject to destruction without just compensation. (Smith-Florida)

WATER AND WATER COURSES--SERVITUDES--ARTICLE 660, LOUISIANA CIVIL CODE OF 1870.
Tul L Rev, Vol 21, No 4, p 716-718, June 1947. 3 p.

Descriptors: *Louisiana, *Obstruction to flow, *Drainage, *Legislation, Judicial decisions, Remedies, Damages, Flooding, Crops, Flow augmentation, Drains, Surface waters, Surface drainage, Surface runoff, Upstream, Water law.
Identifiers: *Drainage servitude.

In the case of Brown v Blankenship, 28 So 2d 496 (La App 1946), defendant landowner allowed brush and other natural growth to accumulate within a natural drain leading from plaintiff's land. The obstruction caused drainage water to remain on plaintiff's land so as to seriously damage crops growing thereon. Plaintiff sued to have defendant remove the obstruction and place the drain in a condition which would permit water to flow uninterruptedly. The trial court held for plaintiff, and the appellate court affirmed holding that under the Louisiana Code defendant was required to keep the natural drain open even though he had taken no affirmative action to obstruct it. Before this case, litigation over the servitude of drainage has involved affirmative actions which constituted a breach of the obligation created by the servitude. The instant case raises the legal question of whether the servitude of drainage imposes an obligation on the owner of the lower estate to take positive action to keep a drain clear of natural obstructions. Under the Civil Code, there is no duty to take any affirmative action to preserve the natural drainage. Therefore, it would seem that defendant owed the plaintiff no duty to take any affirmative action to prevent the natural obstruction. (Heckerling-Florida)

NAVIGABLE WATERS--ARTIFICIAL LAKE CONNECTED TO RIVER,
Donald Eugene Chaney.
Mo L Rev, Vol 24, No 3, p 392-393, June 1959. 2 p, 10 ref.

Descriptors: *Missouri, *Navigable waters, *Artificial watercourses, *Easements, Judicial decisions, Legal aspects, Mississippi River, Overflow, Banks, Dams, Fishing, Navigation, Federal government, Lakes, Relative rights.
Identifiers: *Public easements, Drainage ditches, Dedication.

Defendant created an artificial lake on his land and used it as a fishing resort. When the federal government constructed a dam on the Mississippi River, the water level of the artificial lake rose sufficiently so that it was possible to get a boat from the plaintiff's land across defendant's lake to the river. The plaintiff sued to force defendant to remove from his lake a pontoon bridge, and the trial court found for the defendant. The St. Louis Court of Appeals in Sneed v Weber, 307 SW2d 681 (St L Ct App 1957), held that defendant's lake was not navigable and not subject to a public easement of navigation. This was in line with the general rule that, subject to certain qualifications imposed by the commerce clause, an artificial body of water created by a private person on a site owned by him and not previously occupied by a body of navigable water, even though in fact usable for commerce, is not subject to rights of navigation by others unless the public acquires a right of navigation by dedication, which may be inferred from acquiescence in public use, or unless particular persons acquire an easement of navigation by prescription. DRAINAGE (CHICAGO SANITARY DISTRICT).

Ill Ann Stat ch 42, secs 362 thru 365, 368, 370, 372a, 381 (Smith-Hurd 1956).

Descriptors: *Illinois, *Lake Michigan, *Sanitary engineering, *Public health, Legislation, Regulation, Administration, Sewage, Sewage treatment, Locks, Dams, Canals, Navigation, Channels, Channel improvement, Municipalities, Taxes, Assessments.

The board of trustees of the sanitary district of Chicago may provide for the drainage of additional territory added to the district. The board may provide channels, drains, and ditches for carrying off sewage. The district's powers and jurisdiction over added territory shall be the same as that vested in it over the territory already included within the limits

of said sanitary district. The district shall permit all watercraft navigating the Illinois and Michigan canal to navigate the water of all channels of the sanitary district without delay and without payment of tolls. The district has no power to levy and collect any special assessment or tax upon any part of the added territory. The district may construct all dams north of the upper basin of the Illinois and Michigan canal as may be deemed necessary. (Moulder-Florida)
W70-00940

DRAINAGE-SELECTION, QUALIFICATIONS, POWERS, AND DUTIES OF COMMISSIONERS AND OTHER OFFICERS.
Ill Ann Stat ch 42, secs 4-1 thru 4-39 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Drainage districts, *Drainage systems, *Administrative agencies, Legislation, Legal aspects, Drainage, Regulation, Compensation, Surveys, Construction, Maintenance, Drains, Levees, Eminent domain, Floods, Condemnation value, Right-of-way, Pumping plants, Repairing, Leases, Planning, Dredging, Easements, Assessments, Overflow, Loans, Financing, Wildlife management.

The elections of and qualifications for commissioners of drainage districts are provided for. The commissioners are under the supervision of the court, and many of their actions are subject to review by the court. The commissioners are empowered to: (1) use district funds for any lawful purpose; (2) do all acts necessary for the purpose of surveying, constructing, altering, enlarging, repairing, and maintaining any drain, levee, or other work of the district; (3) exercise the power of eminent domain to accomplish the foregoing purposes; and (4) enter into agreements with any state agency relative to the use and control of ditches, drains, levees, and drainage structures for the purpose of fish and game management. The commissioners are under a duty to keep the drains, levees, pumping plants, and other works of the district in operation and repair. The manner in which the commissioners are to finance the operations of the district is specified; in particular, the commissioners are empowered, subject to court approval, to levy assessments for specified purposes. The commissioners may build up and maintain an emergency fund to meet emergencies arising from flood, overflow, or acts of God. (Keith-Florida)

WATER-DRAINAGE AND LEVEE DISTRICTS.
Ark Stat Ann secs 21-101, 21-406, 21-407, 21-408 (1968).

Descriptors: *Obstruction to flow, *Arkansas, *Rivers, *Non-navigable waters, Salvage value, Navigation, Navigable rivers, Legislation, Drainage districts, Ditches, Drains, Levees, Legal aspects, Costs.
Identifiers: Penalties (Criminal).

The Cache River is declared a non-navigable river. It shall be unlawful for anyone to fell trees or timber in such a manner as to clog drains or ditches. Violation of this provision is a misdemeanor. Anyone who removes such obstruction has a cause of action for the costs of removal against the one causing the obstruction. (Darragh-Florida)
W70-00942

DRAINAGE DISTRICTS.

Miss Code Ann secs 4675, 4710, 4721, 4739, 4744 (1956).

Descriptors: *Mississippi, *Drainage districts, *Drainage programs, *Drainage engineering, Legislation, Eminent domain, Right-of-way, Taxes, Tax rate, Assessments, Condemnation, Utilities, Legal aspects, Channels, Ditches, Diversion structures, Levees, Overflow, Canals.

A procedure for creating drainage districts on petition of one-fourth of the landowners in the proposed district is authorized. Three temporary commissioners shall be appointed and shall have the power: (1) to select a competent engineer to survey the region and make suggestions; (2) borrow money to pay preliminary expenses; and (3) issue negotiable notes. All preliminary expenses of the drainage district shall be paid out of the proceeds of the first assessment levied under this article. Any landowner within the district may build ditches to drain his lands into the public ditches. The Board of Commissioners may condemn a right-of-way for such ditch. The Commissioners of the district may carry the ditches across, under, or through any highway, railroad, or utility lines. Districts created to control overflow and surplus water of rivers and their tributaries may additionally construct by passes to convey surplus waters by artificial means by a shorter route from tributaries to the main water course. This statute is not to be construed as changing the law with reference to the disposition and diversion of waters. (Schram-Florida)

SWAMP LAND DISTRICTS.
Miss Code Ann secs 4757 thru 4757-03 (1956).

Descriptors: *Mississippi, *Swamps, *Drainage districts, *Administrative agencies, Drainage, Channels, Legislation, Taxes, Tax rate, Assessments, Federal government, Administration, Government finance, Water districts, Channel improvement, Maintenance, Operation and maintenance, Legal aspects, Financing.

The swamp land districts previously organized by statute shall continue to operate. The adoption of this code shall not repeal such laws insofar as any of such districts are concerned. If there are no commissioners of such a swamp land district now in office, the county board of supervisors shall appoint three commissioners for a period of four years. The commissioners shall have control and management of all of the affairs of such swamp land district and shall have the power and authority: (1) to make improvements to and maintain existing drainage channels; (2) to contract and cooperate with any appropriate agency of the United States in so improving or maintaining any such channels; and (3) to expend the funds of such district. When recommended by the commissioners, the county board of supervisors may levy an annual tax on land in the district not to exceed twenty cents per acre in any one year. Said commissioners shall have full power and authority to do and perform all acts necessary and desirable in carrying out the purposes of this act. (Schram-Florida)
W70-00953

FLOOD CONTROL - DRAINAGE DISTRICTS.
Miss Code Ann secs 4763, 4765-4766-03 (1956).

Descriptors: *Mississippi, *Flood control, *Drainage districts, *Eminent domain, Condemnation, Easements, Right-of-way, Taxes, Tax rate, Assessments, Drainage engineering, Ditches, Drainage programs, Construction, Federal government, Legislation, Maintenance, Operation and maintenance, Maintenance costs, Administrative agencies, United States, Legal aspects.

The commissioners of any drainage district are authorized to give assurances to the federal government that all flood control works constructed by the United States will be maintained without expense to the United States. Said commissioners may accept for the district any conveyance of lands, such lands to be rented, leased, or conveyed for the benefit of the district. Such lands, when vested in the district, are subject to taxation as are other lands. The commissioners are authorized to fix and levy an annual ad valorem tax not exceeding two mills on real and personal property to defray maintenance of flood control works. The commissioners may also assure the United States that they will furnish rights-of-way for all levees and drainage ditches constructed by the United States. The districts may acquire such rights-of-way by condemnation and eminent domain. The commissioners may levy an annual ad valorem tax not exceeding two mills for the purpose of defraying and expenses of acquiring said rights-of-way. (Schram-Florida)

Identifiers: *Water management districts, Tombigbee River, Penalties (Criminal).

To conserve the state water resources for the realization of its full beneficial use especially with regard to the Tombigbee River Valley, the Tombigbee River Valley Water Management District is created and established. The method by which a county within the Valley may become a member of the District is provided. The powers of the District are explicitly enumerated and those powers include: public works planning to accomplish water resources development; the impoundment of overflow and surface waters for specified purposes; construction and maintenance of necessary facilities; the power of eminent domain; and the power to contract for specified purposes. The District may provide for public parks, recreation facilities, and wildlife conservation. The directors of the District are empowered to promulgate regulations, applicable within the District, regarding water pollution, the waste of water, and recreational privileges. All counties which are members of the District will pay two mills of all ad valorem taxes due the state to the District. The District is empowered to issue bonds for specified purposes. The District may cooperate with other governmental agencies to accomplish the purposes of this Act. (Keith-Florida)

Descriptors: *Mississippi, *Water resources development, *Water conservation, *Water utilization, Legislation, Legal aspects, Surface waters, Watercourses (Legal), Overflow, Natural resources, Regulation, Flood control, Water supply, Pollution abatement, Irrigation, Navigation, Recreation, Tributaries, Public policy, Flood damage, Beneficial use, Impounded waters, Cities, Eminent domain, Administrative agencies, Planning.
Identifiers: *Water managment districts, Tombigbee River.

It is declared as a matter of legislative determination that water resources in the state have not been conserved to realize their full beneficial use. The utilization, development, conservation, and regulation of such waters are necessary to insure: an adequate flood control program, sanitary water supply, fulfillment of irrigation needs, and improvement of navigation and pollution abatement. To carry out the foregoing purposes with regard to the Tombigbee River Valley, the Tombigbee River Valley Water Management District is authorized; the makeup of the board of directors of said District is provided for, and the manner in which counties may get into the District is provided for, and

the manner in which counties may get into the District is set forth. When six counties have entered the District, it will be created as an agency of the state. The enumerated powers of the District include the power to: develop in conjunction with other government agencies plans for public works for the purposes of floodwater damage prevention or the conservation, development, navigation, utilization, and disposal of water; impound overflow water and the surface water of the Tombigbee River and its tributaries for the control, storage, preservation, or distribution of such waters; condemn land for the purposes of this act; overflow public lands within the District; and do any other acts necessary to accomplish the purposes of this act. (Keith-Florida)

The Tombigbee River Valley Water Management District is authorized to provide for public parks, recreation facilities, and wildlife preservation. It may acquire land within the project area for such purposes. The District's Board of Directors is empowered to promulgate all reasonable regulations to secure, maintain, and preserve the sanitary condition of all water flowing into any District reservoir, to prevent the waste or unauthorized use of water, and to regulate all recreational and business privileges exercised within the District. The District is empowered to obtain an appropriation permit from the State Board of Water Commissioners. So long as the District has obligations outstanding, each member county will pay to the District two mills of all ad valorem taxes due by the county to the state and one-half mill on all of the cougty's taxable property within the District. An additional levy of two mills may be made by the counties for the District in specified circumstances. The District's board of directors is empowered to borrow money or issue District bonds for the purpose of financing the District's operations. The District is empowered to act jointly with other political subdivisions to implement the purposes of this act. (Kieth-Florida)

Identifiers: *River basin districts.

To conserve, store, and regulate the waters of the Big Black River and its tributaries and their overflow waters, this act authorized the organization of the Big Black River Basin District. The Act provides for the selection and composition of a board of directors for such district and establishes procedure for the District's creation. Counties becoming members of the District are required to make annual payments thereto from funds raised by special tax levy. Numerous powers are given the District, including the power: (1) to impound and appropriate overflow and surface waters of the Big Black River and its tributaries; (2) to forest and reforest; (3) to prevent soil erosion; (4) to acquire lands by condemnation; (5) to require relocation of roads, railroads, power lines, and other named facilities; (6) to inundate public lands; (7) to establish and operate necessary facilities; and (8) to establish public parks and recreation facilities. The Act further gives the board of directors power to promulgate regulations for the District and sets forth penalties for violations thereof. The District may also borrow money and issue bonds. (Marsee-Florida)

BIG BLACK RIVER BASIN DISTRICT.

Miss Code Ann secs 5956-221 thru 5956-223, 5956-225, 5956-226, (Supp 1968).

Descriptors: *Mississippi, *River basins, *Administrative agencies, *Water resources development, Soil conservation, Rivers, Taxes, Tax rates, Financing, Leadership, Legislation, State governments, Overflow, Erosion control, Dams, Floodwater, Flood protection, Flooding, Flood control, Recreation facilities, Parks, Forests, Forestry, Tributaries.
Identifiers: *River basin districts.

The purposes of this Act are to conserve, store, and regulate the waters and overflow waters of the Big Black River and its tributaries for: (1) commercial, municipal, industrial, agricultural, and manufacturing purposes; (2) recreational purposes; (3) flood control; (4) timber development and irrigation; (5) navigation; (6) soil conservation; and (7) pollution abatement. Toward these purposes the Big Black River Basin District is authorized to be organized. All powers of the District shall be exercised by a board of directors to be selected and composed as herein provided. The District shall be created by the procedures set forth in this Act, after which creation any county may, through its board of supervisors, become a member. Counties becoming members of the District are required to make annual payment thereto from funds raised by special tax levy. (Marsee-Florida)

LOWER YAZOO RIVER BASIN DISTRICT.

Miss Code Ann secs 5956-351 thru 5956-353, 5956-355 thru 5956-358, 5956-360, 5956-361, 5956-369 (Supp 1968).

Descriptors: *Mississippi, *River basin development, *Water districts, *River basin commissions, Legislation, Taxes, Operating costs, Tax rate, Assessments, Surface waters, Overflow, Water conservation, Fish conservation, Wildlife conservation, Optimum development plans, Water pollution, Dams, Canals, Reservoirs, Condemnation, Easements, Construction, Right-of-way. Financing, Water pollution control, Flood control.

Authority is given to organize the Lower Yazoo River Basin District to utilize, develop, conserve, and regulate the waters of that river. Provisions are made for the appointment of a Board of Directors who shall exercise all powers of the District. The creation of the District is dependent upon its ability to get at least three counties to join. Provisions describing the procedure for membership are detailed. Once the District is established, a tax levy of one-half mill is authorized within each member county to support the projects of the District. The District is empowered to: (1) make bylaws and regulations; (2) acquire land; (3) make feasibility studies; (4) impound and appropriate water from the river for beneficial use; (5) construct needed facilities; and (6) acquire by condemnation any easement or property needed. A number of qualifications to these powers are included. Additionally, the District is authorized to provide for the preservation of fish and wildlife, secure sanitary water conditions, and prevent pollution. The power to borrow money and issue bonds is granted. (Schram-Florida)
W70-00964

LOWER YAZOO RIVER BASIN DISTRICT.
Miss Code Ann secs 5956-351 thru 5956-353, 5956-355, 5956-356 (Supp 1968).

Descriptors: *Mississippi, *River basins, *River basin development, *River basin commissions, Water districts, Legislation, Taxes, Operating costs, Tax rate, Payment, Income, Assessments, State governments, Surface waters, Surface runoff, Overflow, Water conservation, Administration, Optimum development plans, Water law, Flood control, Financing.

Provisions are made for the organization of the lower Yazoo River Basin District to utilize, develop, conserve, and regulate the overflow and surface waters of the Lower Yazoo River. A Board of Directors is authorized and all powers of the District are to be exercised by them. Provisions for appointment of members, their compensation, and election of officers are made. If any county desires to become a member of the District, it must provide for an election to do so and approve a special ad valorem tax of one-half mill on all taxable property in the county. When three counties have become members of the District in the manner provided, such District will then become created as an agency of the State. Each county which becomes a member of the District shall pay its pro rata share of the budgetary requirements of the District. Such share shall not exceed the avails of the levy of one-half mill on all taxable property in the county. Additional provisions include the methods of payment and authorization for the taxing power. (Schram-Florida)
W70-00965

LOWER YAZOO RIVER BASIN DISTRICT.
Miss Code Ann secs 5956-357, 5956-358, 5956-360, 5956-361, 5956-369 (Supp 1968).

Descriptors: *Mississippi, *River basin commissions, *Water districts, *River basin development, Legislation, Condemnation, Navigation, Construction, Easements, Right-of-way, Wildlife conservation, Fish conservation, Water pollution, Water conservation, Federal government, Dams, Canals, Reservoirs, Water pollution control, Recreation facilities, Programs.

The Lower Yazoo River Basin District, through its Board of Directors, is empowered to establish plans for public works of improvement for the development of waters in the district for navigation, industry, commerce, and shipping. Additional powers include the right: (1) to make by laws and regulations; (2) to acquire land; (3) to make feasibility studies; and (4) to exercise any other rights inherent to a corporate body. When the district has developed plans for a project, additional powers shall come into being in relation to such project. These include the right: (1) to impound and appropriate for beneficial use water of the river; (2) to construct all facilities deemed necessary; and (3) to acquire by condemnation any needed property. A series of limitations and qualifications to these powers are included. The district is authorized to provide for the preservation of fish and wildlife and to acquire land otherwise than by condemnation for such purposes. The directors are empowered to promulgate regulations to secure sanitary water conditions, prevent waste, and prevent pollution. The board may borrow money and issue bonds and notes to carry out the duties of this act. (Schram-Florida)

WESTPHAL V SCHMALZ (UNAUTHORIZED USE OF DRAINAGE SYSTEM).
169 NW2d 401-403 (Minn 1969).

Descriptors: *Drainage, *Minnesota, *Watersheds (Basins), *Drainage systems, Excess water (Soils), Judicial decisions, Tile drainage, Ditches, Drainage engineering, Drainage water, Land management, Watersheds (Divides), Flood control, Riddance (Legal aspects), Drains, Subsurface drains, Flood damage, Floods, Overflow, Agricultural watersheds, Damages, Assessments, Benefits, Project benefits, Relative rights, Legislation, Legal aspects.

Defendant landowner drained part of his tract into a judicial ditch system serving another part of his tract and plaintiff's tract. The land drained was not within the watershed served by the system and therefore was not assessed for benefits. Defendant cut across the watershed line with a tile drain to connect with an existing outlet in a part of his land within the watershed. Due to the increased pressure and volume of water in the extension serving plaintiff's land, a portion of his tract was flooded after a heavy rainstorm causing flood damage to his crops. Plaintiff was granted a permanent injunction and damages. The applicable statute required a ditch system be used only when the land was assessed for benefits in the original judicial proceedings which established the ditch or when express authority was secured from the proper court or agency. This portion of defendant's tract was not within the watershed, and drainage of the land was not authorized under the statute. (Douberley-Florida)

EFFECT OF CHANGES OF STREAMFLOW REGIMEN ON RESERVOIR YIELD,
State Univ. of New York, Syracuse. Water Resources Center.
Richard H. Hawkins.
Water Resources Res, Vol 5, No 5, p 1115-1119, Oct 1969. 5 p, 4 fig, 1 tab, 8 ref.

Descriptors: *Reservoir yield, *Streamflow, *Reservoir operation, Reservoir storage, Water management (Applied), Water yield, Regimen, Systems analysis, Synthetic hydrology, Hydrographs.
Identifiers: Streamflow regimen changes.

A presumptive approach was used to gain insight into the question: How do alterations of streamflow characteristics affect downstream objectives. The special ease of flows changed in timing and volume from management on the tributary watershed in tandem combination with a downstream reservoir was considered. Change in mean yield of the reservoir was taken as an index of utility of the streamflow changes. Uniform increases of streamflow of 5% and 15% and a half month delay in the annual hydrograph were assumed either singly or in combination, storage yield computations made, and differences in yields determined. Not all extra streamflow was found to be useful although the increases gained utility with increasing storage availability. A timing delay was most important with smaller storage availability and then only to a limited degree. Flow increases combined with a timing delay produced results that were approximately simple additions to the two individual effects. (Knapp-USGS)

Descriptors: *Distribution systems, *Pipelines, Water distribution, Arctic, Cold weather construction.
Identifiers: *Arctic water distribution system.

The report describes the single-main recirculating water distribution system used in arctic and subarctic communities to prevent water main freezing. An historical review, data from a prototype installation, and recommended design procedures are included for Far North facilities. The field data was obtained at Unalakleet, Alaska, a community on Norton Sound, an arm of the Bering Sea. Over a year of continuous data were obtained starting at the time the installation was constructed in 1965. The described facility is one of three presently in existence.

BASIC WATER USE DOCTRINES AND STATE WATER CONTROL AGENCIES.

Am Water Wks Ass'n J, Vol 42, No 8, p 755-760, Aug 1950. 6 p, 1 ref.

Descriptors: *Water policy, *Administrative agencies, *Groundwater, *Surface waters, Water law, State governments, Legal aspects, Interstate compacts, Riparian rights, Appropriation, Reasonable use, Colorado River Compact, Water rights, Water resources, Legislation, Water pollution, Pollution abatement.

Basic water law for both surface and ground water is discussed including the riparian doctrine, appropriation doctrine, common law rule, rule of reasoable use, and appropriation doctrine. Also discused are the state water control agencies which approve water uses. The functions of these agencies are divided into the following categories: (1) surface water; (2) ground water; (3) dams and diversion works; (4) water quality and treatment (public supplies); (5) water quality and treatment (industrial drinking water); (6) stream pollution control; (7) sewage disposal (technical); and (8) industrial waste disposal (technical). Statistical information is presented concerning states having agencies exercising control over surface or groundwater. Briefly examined are several interstate compacts and agreements for the control and development of water resources. (Gabrielson-Florida)

WISCONSIN LAW OF WATERS,
Adolf Kanneberg.
Wis L Rev, Vol 1946, No 2, p 345-393, Mar 1946. 4 p, 151 ref.

Descriptors: *Wisconsin, *Water management (Applied), *Navigable waters, *Administrative agencies, Navigation, Saw log test, Floatable streams, Riparian rights, Dams, Non-navigable waters, Ownership of beds, Federal government, Navigable rivers, Water levels, Water control, Water law, Administration, Permits, Regulation, Legal aspects.

The determination and regulation of 'navigable waters' differs widely within the federal system. Federal definitions make navigable waters public highways, but fail to designate what waters are navigable. Wisconsin adopted the riparian doctrine of water law but has depended on case law and statutes in developing a definition of navigable waters, concluding that streams navigable in fact are public and that those non-navigable in fact for any reason are private property. Although beds under navigable streams may be owned by the respective riparians, those rights of ownership are subject to a public right of navigation. Wisconsin has vested control over navigable waters in the Public Service Commission with power to: (1) regulate the flow and level of water in streams; (2) issue permits to construct dams on navigable streams; (3) issue permits for diversion of surplus water from one watershed to another; (4) authorize bridges over navigable streams; (5) abate unlawful obstructions in navigable waters; (6) contract for the removal of sand, gravel, and marl from beds of navigable lakes; (7) supervise water control for Milldam Act dams; (8) regulate dams on non-navigable streams. THE NAVIGATION SERVITUDE AND JUST COMPENSATION: STRUGGLE FOR A DOCTRINE,
Richard W. Bartke.
Ore L Rev,Vol 48, No 1, p 1-24, Dec 1968.

Descriptors: *Federal jurisdiction, *Condemnation, *Compensation, *Condemnation value, Proprietary power, Riparian rights, Water rights, Easements, Admiralty, Benefits, Water resources, Water resources development, Water, Water law, Navigable waters, Navigable rivers, Legislation,

Water policy, Planning, Eminent domain, Judicial decisions.

The national sovereignty over navigable waters, called the 'navigation servitude,' is similar to an easement and is derived from the Constitution's commerce clause and grant of admiralty jurisdiction. These provisions entitle the federal government to the use and benefit of the bed, banks, and water of any navigable watercourse and have conferred upon the federal government a proprietary interest in the navigable waters of the nation. The problem exists as to what compensation is required by the fifth amendment to be paid for the taking of 'last lands,' or lands just above the ordinary high water mark. The sovereign does not have to pay for what it owns. So where condemned land has added value because of a possible water-power site, no additional compensation is paid. The water power is subject to the navigation servitude, so no private party has an interest therein. Where partial flooding of land would increase the value of the remainder of the land, this increase can be deducted from the compensation for the flooded portion. But if the remainder were also flooded later, only the original value would be awarded. Various other types of awards have also confused and clouded the law. (Smith-Florida)

THE NAVIGATION SERVITUDE AND JUST COMPENSATION: STRUGGLE FOR A DOCTRINE,
Richard W. Bartke.
Ore L Rev, vol 48, no 1, p 24-44, Dec 1968.

Descriptors: *Federal jurisdiction, *Condemnation, *Federal Power Act, *Compensation, Easements, Planning, Condemnation value, Proprietary power, Riparian rights, Water rights, Navigable waters, Water policy, Navigable rivers, Water resources, Benefits, Water, Water law, Judicial decisions, Legislation, Admiralty, Water resources development.

Certain state governments, local governmental bodies, or private parties may invoke the navigation servitude through the federal eminent domain power as a licensee under the Federal Power Act. A licensee likewise will have to pay just compensation for property taken, but not for interests attributable to the navigation servitude. Under section 21 of the Federal Power Act, Congress donated parts of the public domain for the purpose of power development. If any charge is made for these donations, such charge should be reflected in either payments to the federal treasury or lower power rates to consumers. Section 21 should be construed as putting a Federal Power Commission licensee in the same position as the United States, with the same power of eminent domain. The use of water has been rapidly increasing. Therefore, it is becoming more important that planning be comprehensive for an entire basin. In this planning the navigation servitude may be of crucial importance. Once the courts admit that the federal navigation servitude is proprietary in nature, many of the problems involving water rights will be resolved. (Smith-Florida)

STOUDER V DASHNER (DOMINANT VERSUS SERVIENT LAND RIGHTS RELATING TO DRAINAGE OF SURFACE WATERS).
49 NW2d 859-866 (Iowa 1951).

Descriptors: *Iowa, *Surface runoff, *Drainage water, *Obstruction to flow, Surface drainage, Channels, Water spreading, Overland flow, Floods, Drainage, Runoff, Surface-groundwater relationships, Surface waters, Percolating water, Subsurface runoff, Relative rights, Remedies, Legal aspects, Judicial decisions.

Plaintiff upper landowner brought action against defendant lower landowner and others to enjoin them from maintaining obstructions that prevented surface flood waters from draining from plaintiff's land onto defendant's land. Defendant filed a counterclaim for damages and prayed for an injunction for removal of a concrete tube located under a railroad embankment. The original rule in Iowa concerning drainage of surface waters has been modified in the interest of agriculture to the extent that the owner of the higher land may drain his land into a natural watercourse without liability to a lower proprietor for resulting damages, even if the effect is to throw the surface water in somewhat increased volume on the servient estate. A definite channel is not essential to definition of a watercourse. A dominant proprietor may, through use of a ditch, cause water to flow in its natural direction instead of over the surface or by percolation where no new watershed is tapped and where no addition to the former volume is caused by said ditch outside of what formerly reached the same point on the servient tract over a wider surface. Based on this rule the trial court held for the plaintiff and was affirmed by the Supreme Court. (Moulder-Florida)

ROCKLAND COUNTY ANTI-RESERVOIR ASS'N V DURYEA (PREVENTION OF RESERVOIR CONSTRUCTION).
282 App Div 457, 123 NYS2d 445-452 (Sup Ct 1953).

Descriptors: *New York, *Reservoirs, *Reservoir construction, *Water works, Legislation, Regulation, Reservoir yield, Usable storage, Reservoir sites, New Jersey, Safe yield, Water distribution (Applied), Water supply, Water yield improvement, Judicial decisions, Reservoir operation, Reservoir storage, Relative rights.

Spring Valley Water Works, a wholly owned subsidiary of Hackensack Water Company, supplies water to communities in Rockland County. Spring Valley Water Works determined that due to the expanding population and industrial water requirements of the area, more water was needed to meet the area's needs. Following their petition, the Company received permission to construct a reservoir from the Water Power and Control Commission. This decision was challenged, with the principal contention being that the reservoir would have greater capacity than required and that the project was for the primary benefit of the water company. This contention was rejected by the Commission, which stated that an additional source of water was essential to assure Spring Valley an adequate supply for present and future needs. The benefit to the Company was substantial but a necessary, incidental effect of the project. In a review of this decision, the court found that the Commission's findings upon the subject of the project's 'public necessity' were adequate. The Commission did not have to make findings upon the question of comparative well and reservoir costs or the effect of the reservoir on the consumer water rates. Section 396 of the conservation law was found to be constitutional. (Moulder-Florida)

JURISDICTION OF COUNTY DRAINAGE BOARDS.
Ind Ann Stat secs 27-2201 thru 27-2206 (Supp 1968).

Descriptors: *Indiana, *Drainage systems, *Administrative agencies, *Jurisdiction, Drains, Drainage districts, Local governments, Cities, Assessments, Water districts, Riparian rights, Flood control, Maintenance, Benefits, Legislation, Legal aspects.

Legal drains are under the jurisdiction of the county drainage board in each county. Legal drains located within a conservancy district are not subject to this act unless they flow directly or indirectly into any legal drain subject to this act. In such case, the board will assess the lands within the conservancy district to the extent benefited. Legal drains that are part of a flood control project are not within the jurisdiction of this act. Private and mutual drains, and city or unincorporated town drains are not subject to this act, but the lands drained may be assessed for improvements to a legal drain if such lands are also drained by a legal drain. Any or all owners of lands affected by a mutual drain may request the board to assume jurisdiction over the drain and declare it a legal drain. Upon request, the board may determine if drainage maintenance and repair districts or associations formed to maintain and repair drains are no longer active. On finding that such districts or associations are no longer active, the board may declare the drains to be legal drains and assume jurisdiction over them. (McDonough-Florida)
